Vehicle Maintenance Pro

Introduction

This manual — Vehicle Maintenance Pro: The A to Z guide to managing your vehicle maintenance operation — takes a look at the tasks that could fall under the title of Maintenance Pro. The book is divided into two major topic areas — your operations and maintenance related activities, and dealing with compliance issues.

The operations topics covered in this manual place a strong emphasis on the importance of planning, establishing standards, and then living by those standards when it comes to maintenance, safety, and health.

The compliance sections include selected regulations and compliance guidance pertaining to Department of Transportation, Environmental Protection Agency, and Occupational Safety and Health Administration regulations.

Finally, a reference section includes pertinent information relating to the subjects covered in the manual, as well as contact information for the regulatory agencies discussed in the manual.

Revision bars, like the one at the left of this paragraph, are used in this publication to show where significant changes were made on update pages. The revision bar next to text on a page indicates that the text was revised. The date at the bottom of the page tells you when the revised page was issued.

Due to the constantly changing nature of government regulations, it is impossible to guarantee absolute accuracy of the material contained herein. The Publisher and Editors, therefore, cannot assume any responsibility for omissions, errors, misprinting, or ambiguity contained within this publication and shall not be held liable in any degree for any loss or injury caused by such omission, error, misprinting or ambiguity presented in this publication.

This publication is designed to provide reasonably accurate and authoritative information in regard to the subject matter covered. It is sold with the understanding that the Publisher is not engaged in rendering legal, accounting, or other professional service. If legal advice or other expert assistance is required, the services of a competent professional person should be sought.

Determining Maintenance Schedules

Introduction — Why a maintenance manual

Vehicle maintenance is a complicated business. Whatever kind of maintenance facility you are in charge of, if you manage the overall program of both operational and compliance related topics, you've got your hands full.

This manual is intended to be used by Maintenance Pros at all types of commercial carriers. Whenever the term "vehicle" is used, the requirement or concept is universal and applies to all types of commercial vehicles; large (CDL-required vehicles), small (non-CDL commercial vehicles), property-carrying, and passenger-carrying. When a vehicle-specific requirement or topic is being discussed, the type of vehicle the requirement or topic applies to will be specified. Examples include the emergency-exit requirements for passenger-carrying vehicles and the new brake distance requirements related to truck-tractors.

A Maintenance Pro, in the sense of this manual, has the task of managing maintenance operations, people, equipment, and regulatory compliance issues. Operational management involves finding the most efficient and effective way of keeping the fleet operating safely. Personnel management involves directing a group of different people toward a common goal. Employees must be encouraged to reach their full potential if the business is to be profitable. Equipment management means making sure that each unit "pays its way." If it doesn't, it has to be replaced or eliminated entirely. Managing compliance means trying to comply with regulations from DOT, OSHA, and EPA.

Fleet maintenance organization

The organization of a vehicle fleet depends a great deal on its size. Large for-hire fleets usually have a formal organization like any major business with trained people performing specialized tasks. The in-house maintenance shop staff may be equally specialized: equipment manager, shop supervisor, parts person, tire person, line mechanics, regulatory compliance person, etc. The company may also have a mix of shop facilities at various locations around the country, from very large and specialized, to very small and general.

Fleet management for the small fleet is naturally lean. People typically wear more than one hat in this kind of operation. Rather than being specialists, they will probably be generalists, possibly even bringing a background in a family business to their job. A few individuals must handle all the budgeting and accounting tasks, legal licensing and insurance paperwork, driver hiring and managing. They must also go out and get the business, and then service the customer.

Vehicle Maintenance Pro

Notes

The private fleet's goals are not really the same as a for-hire operation. The corporation to which it belongs has created a fleet to meet price and service requirements that are not being met by outside carriers. Because of this, many times private fleets do not operate their own equipment and maintenance facilities. They lease equipment and have lease arrangements that require the leasing company to perform the maintenance. However, the private fleets must still have individuals who are well-versed in equipment maintenance and the associated regulations. Even though the private carrier does not own the vehicles, or maintain them, they are still legally responsible for them (including the inspection and maintenance of the equipment).

Also, private fleets may still have maintenance needs. The operation of a small maintenance facility to perform quick and easy repairs (fixing lights, airing tires, etc.) may be necessary if the leasing company's shop is too far away or not available all hours the fleet is operating. In some of these cases, the vehicle maintenance may be handled through the general maintenance department at the facility. If this is the case, the personnel performing the maintenance may need a considerable amount of guidance on vehicle maintenance.

While the maintenance department does not have to worry about "turning a profit," it does need to keep an eye on costs. It must be able to maintain and repair vehicles as economically as an outside shop. The conveniences of having an inside shop (no need to schedule shop time with an outside entity, the ability to prioritize work, control of manpower, faster turnaround times, in-depth knowledge of the equipment and maintenance schedules, etc.) can be outweighed if the shop becomes too expensive to operate.

Maintenance is a very labor-intensive part of fleet operations. Even the best diagnostic equipment is only as good as the technician who uses it. The shop can only be cost-effective when productive people are employed there. The challenge to maintain a safe, reliable vehicle at the lowest possible cost can only be achieved by people who really believe in this goal. The goals of the maintenance shop and the themes that will run throughout this manual are to increase productivity, reduce maintenance costs, and improve vehicle utilization to increase profitability.

The whole principle of an effective vehicle maintenance operation is to keep the vehicles rolling, so they have the maximum opportunity to make money for the company. Whether you work with a for-hire trucking operation, a for-hire motor coach company, a school bus company, a private fleet, or some other kind of transportation company, profit is at the bottom of most considerations.

Why have PM and schedules

PM, or preventive maintenance, involves scheduling inspections and maintenance to prevent vehicle breakdowns. The PM program, and the associated scheduling, are at the heart of any effective maintenance program. It is the logical place for a Maintenance Pro, as well as a manual intended for a Maintenance Pro, to begin.

Shop Operations

Present regulations require that every motor carrier shall systematically inspect, repair, and maintain, or cause to be systematically inspected, repaired, and maintained, all motor vehicles subject to its control (49 CFR §396.3). The full text of the DOT inspection requirements can be found in the DOT compliance management and regulations sections.

Regulations are not the only reason to run an effective PM program. A well-maintained vehicle is less likely to be involved in an accident, will be more productive, and require less unscheduled maintenance and repair, which is more expensive than PM. To sum it up, PM leads to less accidents, better customer relations, and a lower cost of operation.

Another strong incentive for a good PM program is the possibility that the vehicle will be pulled over for a roadside vehicle inspection. If the vehicle is found to have a mechanical condition that might result in a breakdown or an accident, it will be put out of service. The vehicle cannot resume its trip until the unsafe condition is corrected.

Preventive maintenance is also an attitude, a commitment. It doesn't mean simply getting a vehicle into the shop and fixing what you see. It means being constantly on the lookout for things that might go wrong. It means getting the best, most cost-effective equipment for the vehicle and then taking care of it. This is much like preventive medicine that stresses good eating habits and regular exercise as a continuing prescription for good health and long life.

The PM philosophy is widely used, not only because it reflects a modern attitude of conservation, of using what assets one has wisely, but because it saves money. No one can argue with the bottom line. As PM takes hold, the standard of excellence for a maintenance shop changes from getting the fastest repairs to getting the fewest repairs.

PM also requires careful recordkeeping of what is done. In addition to complying with regulations, PM records have another use. Once reliable PM schedules are established, they are refined for the individual vehicle and can be used to predict maintenance. Fleets that do not use records for more than simple documentation are not taking advantage of the goldmine of information that's there. And it's quite likely that those fleets are not managing their vehicles, the vehicles are controlling them.

To sum it up, vehicles that are put out of service or breakdown will require unscheduled maintenance (repairs). Repairs done on the road can be very costly both in lost productivity time and additional repair costs (commercial shops tend to have a considerably higher cost) when compared to the cost of operating a PM program. Using a "we'll fix it when it breaks" maintenance program can get very expensive.

Notes

Notes

Determining PM intervals

Measuring the interval

The first decision that needs to be made when determining a PM schedule is what method of measurement you are going to use. There are several methods used to schedule vehicles for preventive maintenance. The three most common methods are:

- **Time** — This method is by far the easiest for management, but is often the most wasteful as far as technicians' time, parts, and cost. Scheduling vehicle preventive maintenance based on time means exactly what it says. A vehicle will be scheduled into the shop every x amount of days regardless of mileage or engine hours used since its last PM.
- **Miles** — Scheduling PMs based on vehicle miles driven is the most common method used for scheduling vehicle preventive maintenance. A vehicle will be scheduled into the shop after a predetermined amount of miles have been driven on the vehicle. There are, however, a few problems associated with this method. The biggest problem is that scheduling PMs based on mileage does not take into account engine idle time or PTO time that could be a large percent of the engine's running hours. To compensate for this, some carriers that use mileage shorten the mileage interval to compensate for excessive idling or PTO time.
- **Engine hours** — Scheduling PMs based on engine hours makes sense for vehicles that work hard during every mile, but do not do many miles. Waste trucks, concrete haulers, and gravel trucks are all good examples of vehicles that are typically scheduled for PMs based on engine hours. The reason these trucks are routed into the shop for PMs on the basis of engine hours is because they are constantly working hard — even though the truck may be averaging low miles per hour and miles per day.

The type of vehicles and the type of operation will determine the best type of PM scheduling for your individual company.

Methods for determining interval

This part of the maintenance program, the PM intervals, comes from several sources:

- The original equipment manufacturers' (engine, transmission, and other component OEMs) recommendations are the primary source and the most important ones. If the fleet has bought a new vehicle, that's the only reliable source of information. You should follow the recommendations exactly until your own experience proves otherwise. You can also get information about expected component life from those manufacturers and plan accordingly. You must be careful about deviating from the OEM's recommendations. If you deviate too far you may lose some, or all, of the warranty on the vehicle or vehicle components.

Shop Operations

- Your repair records (your history) are the second source. Even if you are planning PM for a new vehicle, past maintenance history on similar vehicles that do the same work can give you important clues about how the fleet vehicles have been operating and helps you plan the maintenance schedule for the new vehicle.
- Your own people (drivers, technicians, and other shop personnel) are your third source. Ask them for suggestions. A successful PM program will need the cooperation of everyone, and the best way to get that support is to start out with the same people. They should help to put the plan together. Ask for specific ideas about the PM intervals.
- Tracking internal performance measures. These measures can include oil sampling (if oil samples tested following oil changes are indicating oil breakdown, shortening the interval may be necessary), part failure analysis, unscheduled repairs, on-the-road repairs, on-the-road breakdowns, and out-of-service violations. It does not make any difference how well your maintenance schedule matches up with the OEM's recommendations, if the vehicles are constantly breaking down or are constantly in need of major repairs (such as engine replacements).

One issue that will need to be considered when establishing the maintenance interval is the need to service the emissions system. In vehicles built to the 2007 and 2010 emissions standards there are parts in the emissions system that require regular service. Diesel particulate filters (DPF), selective catalytic reduction (SCR) systems, and exhaust gas recirculation (EGR) components all require routine service.

Determining PM checklists

As was mentioned earlier, PM involves scheduled inspection and maintenance of the vehicle. One key to making sure the necessary items are being inspected and maintained is the development of maintenance checklists. At the end of this chapter there are examples of PM checklists that are commercially available. If you want to develop your own, there are many factors that must be considered. Some of these factors are:

- OEM recommendations. All OEMs provide recommended inspection and maintenance items and procedures. These should serve as the basis for any program you develop.
- Regulations. Certain inspections are mandated in the Federal Motor Carrier Safety Administration regulations. An example of a mandated inspection is the periodic (annual) inspection. The items found in Part 393 and Appendix G can serve as the basis for any checklist covering a required inspection.
- Your history. By data-mining maintenance records and determining ECLS and MTBF for various parts and components, you can predict when parts and components become unreliable. Also, testing samples of fluids can determine the length of time fluids should be left in the various components, and therefore, the timing on fluid changes.
- Your people. If your technicians are reporting that they are constantly having to repair a part or component on vehicles, and the part or component is not on the PM checklist, you should consider adding it.

In the above discussion we hit on some terms and concepts that we need to further explore.

ECLS and MTBF

ECLS, or Expected Component Life System (sometimes referred to as Expected Component Life Cycle System), is a method of studying vehicle maintenance trends and replacing parts and components before they fail.

The first step to effectively using ECLS to determine PM checklists is having accurate maintenance data. By digging through the maintenance records and mining data out of the records, the Maintenance Pro can determine the Mean Time Between Failures (MTBF) for all parts and components on the vehicle. The MTBF is nothing more than the average miles or hours that a component fails

Once the MTBF has been determined, the next step is to determine the ECLS replacement schedule for the component. If the ECLS is set at the MTBF, roughly half of the vehicles will suffer a failure of the component or part before it is replaced. If the ECLS is set at the earliest known failure point, then many times the part or component will be removed from the vehicle well before replacement is necessary.

Notes

Vehicle Maintenance Pro

Notes

The basic question becomes, what are you willing to accept for an on-the-road failure rate? If you do not want any on-the-road failure of the component in question, then you will want to set the ECLS at the earliest known failure point. However, if the item is not a critical component, or an item whose failure can be easily dealt with when the vehicle is on the road, then using the MTBF point as the replacement point may be acceptable.

Wear limits

Some components, such as tires and brakes, can be tracked through the MTBF and ECLS programs, but their replacement will be directly tied to the vehicle inspections. The MTBF and ECLS data can be used to compare tire and brake performance, but the decision to replace the parts will be based on the findings of inspections. This is done through determining “wear limits” on parts and components.

Wear limits are the minimum acceptable depths or thicknesses you are willing to allow on a component, regardless of the MTBF or ECLS data. An example would be tires. The legal minimums for a tire are $\frac{4}{32}$ ” on the steer axle, and $\frac{2}{32}$ ” on all other positions. As a company you have decided that you are not going to allow the tires to wear down to that point. You will replace steer tires at $\frac{8}{32}$ ” and all other tires at $\frac{4}{32}$ ” (this is then considered your failure point for MTBF purposes).

The MTBF and ECLS can give you a general idea of when the wear limit should be reached, but how many hours or miles it takes to reach the failure point is irrelevant. Once the tire has worn to the predetermined point (either $\frac{8}{32}$ ” or $\frac{4}{32}$ ”), the tire is replaced.

Fluid sampling

Another method of determining maintenance needs that does not involve MTBF and ECLS is fluid sampling.

Fluid sampling and testing can provide the Maintenance Pro with a “wear limit” method of analyzing the internal condition of a component. A prime example is the engine.

By simply looking at an engine the Maintenance Pro cannot tell the condition of the internal parts. A MTBF study can determine when most of the engines will fail. But with engine rebuilds being an expensive repair, doing a rebuild simply based on MTBF and ECLS data could lead to unnecessary and costly maintenance.

Taking an oil sample, and having it tested, can give the Maintenance Pro a look inside the engine. If antifreeze is appearing in the oil, that can indicate a head gasket is leaking. Iron, steel, chromium, or aluminum particles in the oil sample can indicate that the one of the internal components of the engine is beginning to fail. The presence of excessive copper (or similar metals) in the oil can indicate that there are bushings or bearings that are beginning to wear.

Shop Operations

Sampling and testing other components can also locate problems. Transmissions, differentials, and auxiliary hydraulic systems (wet kits) are all examples of components where sampling and testing can indicate problems in advance of failure.

Testing the fluids in every vehicle component at every service could get costly (\$7 to \$15 dollars per test). Many carriers are willing to pay this and consider it part of the PM cost of the vehicle. As well as providing early warning of problems, a regular sampling program can help with any warranty claims associated with the component (sampling will show the failure was a sudden failure, not due to neglect over time).

What many carriers that use sampling do is combine sampling with MTBF and ECLS data. When the vehicle first enters service, samples are only taken at benchmark intervals, such as during quarterly or the annual inspection. Once a vehicle reaches a predetermined threshold, the sampling and testing then become part of all regular inspections. Here is an example of a combination approach:

- **Engine:** Due to MTBF and ECLS data we will sample and test engine oil as part of the annual inspection for the first two years. After the second annual inspection engine oil sampling and testing will be performed as part of each oil change.
- **Transmission:** Due to MTBF and ECLS data we will sample and test transmission oil as part of the annual inspection for the first five years. After the fifth annual inspection transmission oil sampling and testing will be performed as part of each oil change.
- **Differentials (including interaxle):** Due to MTBF and ECLS data we will sample and test differential oil as part of the annual inspection for the first five years. After the fifth annual inspection differential oil sampling and testing will be performed as part of each oil change.

Documenting preventive maintenance

The FMCSA regulations require that the company have a record system that shows the vehicle's maintenance schedule, and last and next scheduled service (both due date and nature of the service). The regulations do not spell out how a company is to accomplish any of this. The regulations do not provide a "required schedule" or "required form and format" for documentation. The regulations only require that a company have a systematic maintenance program and document it. One reason the FMCSA does not "spell out" a preventive maintenance schedule that carriers must follow is because of the wide variety of commercial vehicles that are in operation and covered by these regulations. Everything from pickup trucks to motorcoaches to tractor-trailers are covered by these regulations.

To develop and document the preventive maintenance program a Maintenance Pro will need to use the information we have mentioned so far, and then develop and document the maintenance program for each vehicle (or group of vehicles). This is not as complicated as it sounds.

First, for preventive maintenance purposes and later tracking divide the vehicles in the fleet into "dynamic groups." Each group should be made

Notes

Vehicle Maintenance Pro

Notes

up of similar vehicles (based on similar traits and maintenance requirements, not necessarily make and model).

Next, review the existing information for each group and write a preventive maintenance schedule (including intervals, checklists, and wears points for important and high-wear components).

Once you have established the schedule for each of the dynamic groups, copy them and place a copy into the corresponding vehicle files. As well as containing the preventive maintenance information, the vehicle files must also contain identifying information (vehicle number, make, VIN, year, tire size, and the entity providing the vehicle if it is not owned by the company), and records of all inspections, maintenance, and repairs. This is required by the FMCSA regulations under §396.3. For more information on these regulations see the DOT tab in the Compliance section of this manual.

Finally, either on a form in the file or physically on the file, keep track of each scheduled preventive maintenance, and record when the next scheduled maintenance is due.

Some companies go one step further to make the process easier. In addition to the files they use a wall board that displays the individual vehicles and last/next service. This way, technicians and supervisors can tell at a glance when a vehicle received scheduled preventive maintenance last, and if it coming due for its next service.

One key point to remember: The FMCSA is letting you develop your own preventive maintenance program and schedule. However, the FMCSA is going to expect you to adhere to your program and schedule, just as if they were regulations. This really is a case where you “get to write your own regulations.” As long as you have a documented preventive maintenance program that includes a maintenance schedule, records that show past and future maintenance, your vehicles are being serviced in accordance with your schedule, and your vehicles are passing roadside inspections, the FMCSA will be satisfied with your preventive maintenance program and schedule.

Example of a PM schedule

The actual maintenance portion of PM is composed of scheduled and standardized inspections and maintenance. This is sometimes referred to as the vehicles’ “scheduled service,” or simply “service.” PM services are commonly designated as A, B, C, D, etc. Under the normal system, every letter you move up into the alphabet represents an increase in the complexity of the PM service (and time required).

PM A services are also known as a “maintenance check-out” or “safety inspection” and generally consists of a safety check and lubrication as well as checks of key components such as brakes, lights, tire condition and inflation, and fluids. It also includes checking and adjusting high wear components. Typically, these PM As are scheduled at half of the oil change interval of the vehicle. The normal interval for A service is between 1,500 and 2,500 miles on light vehicles, and between 5,000 and 10,000 miles on medium and heavy duty vehicles.

Shop Operations

Note: Some companies use an “inspection lane” and perform an A service every time the vehicle returns to the maintenance facility.

PM Bs normally include all PM A items, and also include an oil and filter change, as well as more in-depth checks of the engine and driveline. The normal interval for B service is 3,000 to 5,000 for light duty vehicles and 10,000 to 20,000 for medium and heavy duty vehicles. A PM B should also include a download of the ECM and action on any troublecodes or problems reported by the ECM (if applicable).

One consideration with passenger-carrying vehicles is that the pushout windows, emergency doors, and emergency door marking lights must be inspected once every 90 days. If the vehicles will not be undergoing PM Bs within 90 days, then this inspection item will need to be included in the PM A inspections for these vehicles.

PM C service calls for both A and B service and more extensive service (i.e. alignment, scheduled component replacement, the DOT annual inspection required by §396.17, and other scheduled engine and driveline component inspection or replacement). Normally, C services are scheduled annually. To make sure they are done in a timely manner, it is not unusual for carriers to actually schedule them on an eleven-month schedule.

PM D service is either a scheduled rebuild or replacement of a major component (i.e. engine, transmission, axle) or a “special” service. Examples of “special service” are seasonal service (winterization or summerization) and scheduled upgrade services. Scheduling of D services varies by company. The D designation may or may not be used, depending on the company.

Companies continue the lettering system based on their needs. Some companies go as far as PM L.

Don’t forget the trailers! Trailers are subject to the same regulations as the vehicles that pull them and should be subject to the same type of PM program. Typical preventive maintenance scheduling for a trailer is:

- **T1 or TA** services are scheduled every 3 months. This PM service includes an inspection and lubrication, including a check of (at a minimum) the lights, tires, brakes, coupling devices, safety equipment, and any other “systems” (refrigeration unit, sliding axles, etc.).
- **T2 or TB** PMs are scheduled every six months. This PM service includes all the items of a T1, and a more in-depth inspection, as well as additional maintenance (pulling off hubcaps to check grease condition, retorquing lugs, etc.).
- **T3 or TC** services are normally scheduled annually. These include all the inspection and maintenance included in a T1 and T2 service, along with more extensive maintenance such as an alignment or complete brake overhaul. Some carriers will also perform the periodic (annual) inspection required under §396.17 as part of the Type T3 service.

Don’t forget the auxiliaries! Auxiliary power units (APUs), refrigeration units, wet kits, hydraulic pony engines, lavatory systems (in motorcoaches), and idle reduction equipment all need to undergo the

Notes

Vehicle Maintenance Pro

Notes

same scheduling process as the vehicles and trailers. The maintenance scheduling for these units can be rolled into the vehicle they are associated with. Examples would be servicing the wet kit on a vehicle each time the vehicle is serviced and servicing an APU as part of an annual inspection.

Inspection lane — An inspection lane is a designated lane or shop bay where vehicles entering or exiting (or both) the facility must check in or out. When in the inspection lane a technician will do an inspection on the vehicle. An inspection lane can be used to serve as a location to perform A inspections, if the vehicle is due for one, or it can be used strictly as a screening location.

In the “screening location” function the technician can check items such as driver complaints, body damage, fluid leaks and levels, lights, wipers, springs, brakes, tire pressures, and time or mileage since the last PM.

The vehicle might also be washed quickly. If a problem is discovered, the technician can then communicate the problem to the maintenance supervisor. The vehicle can then be scheduled for repairs or service in the regular maintenance/repair area.

Also, if the vehicle is being checked into the yard, the driver can submit his or her DVIR to the technician doing the inspection, beginning the DVIR process while in the inspection lane.

The inspection lane can be located within the shop, but it is more often located in the yard next to the shop because it's more convenient for the driver to drive through an open area rather than back into or drive into a building. Also, having space available in the yard is more predictable.

Timing is the critical element for this kind of inspection. Usually a vehicle gets inspected every time it enters or exits the yard, so the inspection must be done quickly. Some fleets are very strict about this requirement; a vehicle has to run through the lane even though it may have been gone for only a half-hour. If the inspections take too long, it may be difficult to maintain operational support for the inspection lane.

Fleets who use inspection lanes often run time-critical movements, i.e. passengers or food service delivery, and management wants to be absolutely sure that vehicles are in top condition every time they are in the terminal.

Maintenance people who use inspection lanes emphasize that if you are considering adding this kind of inspection, you should resist the temptation to make even minor repairs in the lane. All repairs must be done in the shop and accompanied by the appropriate request paper work, repair order, etc. However, some regular servicing may be scheduled for the lane.

One fleet, for example, greases their trucks during every inspection lane visit. It should also be mentioned that the inspection lane supplements driver inspection and the regular PM inspections; it does not replace them.

The inspection lane routine may prove to be too expensive or cumbersome for every fleet. In place of it, some companies use a process of “yard checks.” At specified times throughout the day, technicians will “cruise

Shop Operations

the yard” and check the equipment that is newly arrived into the yard. These checks involve simple items, such as brakes, tires, lights, body damage, and upcoming maintenance requirements. The technician will then record all units in the yard, and what work was done on which vehicles. If a vehicle is found to be in need of major repair or PM during the yard check, the technician will tag the unit as due for maintenance or repair, and then report it to the maintenance supervisor. The vehicle will then be worked into the shop for the needed work (similar to what happens in an inspection lane).

Other carriers do not use inspection lanes or yard checks at all, and rely entirely upon schedules and the drivers reporting to the shop when a vehicle is due for PM or in need of repair.

The bottom line is only you can decide how much PM to give your vehicles, and how to schedule it.

Pre-service inspection.

The concept of a pre-service inspection should be applied to all equipment new to the fleet, whether new or used.

With used vehicles, beginning with a C level PM inspection (and service) is preferred and recommended. Additionally, all accessible nuts, bolts, and adjustments (lug nuts, hub nuts, axle nuts, bell housing bolts, motor mounts, dash screws, front-end alignment, etc.) not normally checked as part of a level C inspection should be checked, retorqued, and/or adjusted. Developing a pre-service checklist of what you consider key components is critical.

New vehicles can benefit from this process as well. Since everything is new, you may be less concerned with the overall condition of the unit, but you will still want to make sure everything has been properly located and torqued. Many maintenance pros have “horror stories” concerning problems with brand new vehicles.

Also, you will want to be sure that everything you specified is on the line-setting sheet and actually on the vehicle. You will also want to check the model and serial numbers, sizes, etc. of all components, and log them into your recordkeeping system.

You should also consider doing pre-service inspections on vehicles that have been inactive for a significant amount of time (due to extended maintenance, driver unavailability, accident repairs, drop in demand, etc.). It would create another set of problems if a vehicle fresh off major repairs broke down for an unrelated reason that could have been found in a pre-service inspection.

How much time should you spend on a pre-service inspection? The time spent on a pre-service check depends on fleet policy. Some fleets put in a day and a half on a new semi-tractor; others add a road test and extensive component testing which can push the time to over a week, depending on the detail. The objective is to make sure that every part is tight and in good working condition.

Fleets that consider the pre-service check to be an important part of PM assign the mechanics who will be in charge of the vehicle to the task.

Notes

Vehicle Maintenance Pro

Notes

Managers who feel a superficial check is good enough assign a less-expensive employee. Either way, it is probably to your advantage to use a detail-oriented employee.

You will have to create your pre-service standard according to the equipment. The line-setting sheet gives the frame of reference; you determine what checks will need to be made and develop the list from there. That checklist is, in a sense, the first service document of the new vehicle. As such, it becomes a standard quality control reference. On it you may want to include the quantities and grades of fluids added, belt tensions, tire pressures, etc.

Deciding how soon you wish to bring a new vehicle back into the shop for a follow-up inspection after its pre-service inspection is your next decision. This may seem like an unnecessary procedure, but again, the idea is to catch things before they happen. The follow-up inspection is actually part of the shakedown, and the vehicle should not be considered as fully in service until this step is completed. This is because the maintenance department cannot simulate the operational environment the vehicle will be operating in no matter how hard they try. Allowing the vehicle to operate in the environment during a short shakedown period will allow any potential problems to be dealt with early.

Sometimes a representative from the dealership is present during different phases of the pre-service inspection process. This can be an advantage if something has to be changed by the manufacturer, especially if you want immediate action.

You might also use the pre-service inspection process to familiarize drivers with the new vehicle.

Trailers should be looked at carefully too. A new trailer should be put through the same paces. Too often a trailer is neglected, especially the pre-service check, which may seem unimportant. Remember, federal regulations require that trailers have a regular maintenance schedule.

If you are going to add any special equipment to a vehicle during the pre-service period (lift gate, autogreaser, wheelchair lift, etc.) or at any other time, you will want to add a couple of steps to the process. First, verify that the alterations are legal by checking Part 393, Part 571, and Appendix G (included in the Compliance Management and Regulations sections of this manual). Next, be sure to add the work to your pre-service and inspection checklists.

At the end of this unit are examples of maintenance and pre-service checklists. While they are primarily aimed at large property-carrying vehicles, they can be modified for smaller vehicles and passenger-carrying vehicles by adding or removing specific items.

Shop Operations

Driver's role in PM

Driver inspections

A driver is required to perform a pre-trip inspection (§392.7 and §396.13) and determine, to the best of his or her ability, that the vehicle is in safe operating condition. The driver also completes a written post-trip inspection report on vehicle condition at the completion of each day's work (see §396.11). This report is then submitted to the carrier.

The driver is primarily concerned with reporting safety problems; each time the driver operates the vehicle, the driver's pretrip inspection certifies that the vehicle is in safe condition. Driver inspections are different than PM inspections.

PM inspections are performed by maintenance personnel and involve in-depth inspection of vehicle components, possibly requiring the removal of access covers and other components to conduct the inspection, and involve specific measurements of parts and components.

The maintenance team approach sees the driver as a partner in maintenance. When the driver goes a step beyond the specific driver inspection report, looking and listening for potential problems that may be developing and reporting them to the maintenance department, he or she is contributing to the PM program. Problems unrelated to safety are reported so that the vehicle can be checked during the next scheduled maintenance inspection. Body damage, a hose starting to show wear, etc. are important clues that need further investigation and attention.

To sum it up, driver inspections are concerned with what condition the vehicle is presently in, while a PM is concerned with keeping the vehicle in good condition. By working as partners and allowing their responsibilities to overlap, the mechanics and drivers can keep the fleet in excellent condition.

Driver training: driving habits and PM

The driver's commitment to PM begins where the inspection report leaves off. He or she must inspect for safety, but we've also seen how important accurate, consistent driver observation can be in alerting mechanics to potential problems. Here's where attitude comes in. The driver must believe that taking care of the vehicle is important and that it can really extend vehicle and component life, contribute to a safe vehicle, and save money for the fleet.

Drivers make a more tangible contribution to PM through their driving habits. If the fleet has developed specific cost-cutting maintenance policies, it is fleet management's responsibility to train drivers to accomplish these goals. As the Maintenance Pro you may be asked to assist in that training in an effort to reduce maintenance costs, extend equipment life, and promote fuel economy, all areas directly affected by driving habits. Let's use four subjects as examples: tires, brakes, clutch, and fuel economy.

Tires: Your drivers know the inspection procedures for tires. They need to be sure that the tire is properly inflated and clean, that the lug nuts are tight, that the tire is free from cuts or punctures, and that it has

Notes

Vehicle Maintenance Pro

Notes

adequate tread. These inspection items are covered in basic CDL training. To make the driver more active in the PM program and more proactive, train the drivers to also check for:

- strange wear patterns,
- mechanical faults,
- mismatched duals,
- wrong tubes or flaps,
- unsuitable rims and wheels,
- incorrect mounting,
- objects lodged between duals,
- missing valve caps, and
- valve stem pull-through or shear.

Drivers also need to understand that fast stops and starts will wear out tires before their time. Bouncing over chuck holes and curbs, and running over debris in the road can also spell early death for a tire. Are drivers aware that bouncing over a chuck hole or curb can cause sudden tire failure, break or bend the rim, throw the wheels out of balance, misalign the wheels and the front end, and/or knock off hub caps?

Most importantly, encourage frequent inflation checks by drivers using an accurate tire gauge. Tires should be checked with a gauge when cold, before operation. Under-inflation, and the heat it generates, is the major cause of tire problems. Under-inflation leads to excessive wear, damage to the sidewalls due to extra flexing, and eventually complete failure if not corrected.

Over-inflation can negatively affect tire life also. An over-inflated tire is not distributing the weight it is carrying across its whole "footprint." Only the center of the tire is bearing the weight, so this part of the tire will suffer from excessive wear. Warn drivers that when gauging "hot" tires they will appear to be over-inflated. This is normal as tires will increase their pressure between 10 and 20 percent when hot. Because of this, instruct drivers to never let air out of a hot tire.

"Thumping" tires with a hammer or tire club can tell the driver if the tire has air in it, but not how much. Thumping should be done during an enroute inspection when the tires are warm from running down the road and a gauge would not be accurate. Thumping can locate tires that are severely under-inflated, and in need of immediate repair. Drivers that get in the habit of gauging tires as part of their pre-trip and thumping tires at every stop can significantly reduce blowouts, the most expensive and time-consuming type of tire failure.

An important PM training point to share with drivers is refilling tires safely. Due to the hazards involved in filling tires, you must ensure that your drivers (and technicians) are familiar with, and follow, the safety rules involved in filling tires. Here are basic rules for drivers:

- Use a locking chuck,

Shop Operations

- Do not be in line with the sidewall when filling, and
- Never refill a tire that has been run down the road at 20 percent or more below normal cold pressure.

Tires that have been run down the road 20 percent or more below normal pressure could easily have sustained sidewall damage because of the extra flexing the tire may have done. This damage may not be evident until someone tries to bring the tire back up to normal pressure. The damaged sidewall can fail with little or no warning. There could be a second or two of “popping” just before failure, but you cannot count on that. This is known as a “zipper failure.” Tires that have been run down the road 20 percent or more below normal pressure must be removed from the rim, repaired, inspected, and refilled in a safety cage if deemed serviceable by a tire technician.

Drivers that understand how to take care of their tires will be performing a valuable PM function while on the road. The more problems drivers can deal with proactively, the less the chances of breakdowns or major time spent performing repairs in your shop!

Brakes: Out-of-adjustment brakes continue to be a major out-of-service violation for heavy trucks (as well as other vehicles). In addition to a potential downtime, there is a safety concern that brakes which need adjustment provide the vehicle with only 50 percent of their normal braking ability.

Out-of-adjustment brakes can also create a brake imbalance that could potentially cause the vehicle to enter a side-skid during a panic stop.

As well as creating a safety hazard, brakes that are out-of-adjustment lead to abnormal wear. The brakes that are in adjustment have to do extra work when the vehicle is slowed, leading to excessive wear on these brakes. On downgrades, the brakes that are in-adjustment may over-heat, damaging them.

Are drivers aware how dangerous fanning the brakes is? Do they know that this habit can gradually reduce available air in the reservoirs and cause excessive wear? Gearing down on descents and in traffic is the better way. Good braking technique really boils down to good driving. Drivers should be trained to anticipate the moves of other drivers and proceed at the speed most appropriate for existing road conditions to minimize harsh brake use.

Good driver brake maintenance starts with a daily pre-trip inspection. Carriers should consider training drivers to perform the equivalent of a Level 2 CVSA inspection, which includes looking for signs of oil leakage (hub seal indicator reading low or oil/grease on the brake shoes), wear or cracks in the brake linings, and cracks in the brake drums. Drivers should also check the push rods to see if the slack adjusters are in adjustment. All of this can be taught to a driver within a very short time.

Just like the tires, if drivers are finding potential brake problems before they become major problems, the maintenance task becomes much easier.

Clutch: A clutch can't last forever, but its life can be extended by good driving technique and a driver that knows when it needs to be adjusted. The skills most important to master in clutch operations are starting in

Notes

Vehicle Maintenance Pro

Notes

the right gear, engaging the clutch properly, and recognizing clutch malfunctions and the need for re-adjustment. Riding and slipping the clutch, disengaging and engaging the clutch while coasting, and coasting with the clutch released and the transmission in gear will shorten clutch life.

The driver can also be helpful in diagnosing clutch problems. Clutch noise out-of-the-ordinary may mean that there is looseness or wear in the clutch or one of the associated parts (throw-out bearing, linkage, etc.). It could also be a sign of poor lubrication. Clutch slippage could be a sign of worn clutch facings or a lack of clutch pedal free play. Can you driver tell that the clutch is slipping and why? Clutch drag might be poor adjustment or something as serious as a warped drive disc. Help your drivers to be specific about complaints. When does the problem occur? Is it only present at certain speeds or in certain gears? Does the problem disappear when power is increased or decreased?

If the driver is trained on what to expect out of the clutch, how to treat it, and how to answer clutch-related questions, the driver can become an active member of the PM program with regards to the clutch. The clutch is a prime example of a component where the driver's knowledge can keep maintenance costs down by catching problems early.

Fuel economy: Many factors play a part in determining how economically a vehicle consumes fuel. The size of the engine, the transmission gearing, the differential gearing, the aerodynamics of the vehicle, the speed the vehicle operates at, the terrain the vehicle operates on, and the ambient temperature the vehicle must deal with are all examples of factors that will ultimately determine fuel mileage.

Fleets can take different approaches to a fuel-economy program. They may place their emphasis on equipment specifications or fuel quality. They may look toward routing efficiency and make an effort to maximize loads.

The driver is the end-user of fuel-efficient equipment, quality fuel, and a well-maintained vehicle, so whether these measures work depends on him. Convince the drivers that the easiest and cheapest way to save fuel is to slow down and adopt a less aggressive driving style. Other practices that should be encouraged by the fleet to improve fuel economy may be avoiding excessive shifting, high RPM driving, and idle time.

A curious thing bears mentioning here, drivers that driver have the habit of driving with fuel mileage as a goal (they try to practice smooth steady acceleration and deceleration, low RPM and progressive shifting, and keep idle time to a minimum) will operate the equipment in a manner that will reduce maintenance problems. This is because the same driving habits that increase fuel mileage reduce wear and tear on the vehicle. The less wear and tear the vehicle is undergoing, the more effective the PM program can be.

Finally, encourage drivers to keep the vehicle clean. Keeping the vehicle clean will make spotting minor mechanical problems easier.

Examples of various maintenance and inspection checklists are included at the end of this unit.

Shop Operations

Case study

What follows is a case study on how vehicle maintenance scheduling and practices (including recordkeeping and training) can all be combined to create a dangerous (in this case a fatal) situation.

The NTSB investigated a crash involving an air brake equipped dump truck that was unable to stop while descending a grade in Glen Rock, PA, striking four vehicles that were stopped at an intersection at the bottom of the grade. One of the four other vehicles also struck three pedestrians after being hit by the dump truck.

The brake failure was so complete that even after striking the vehicles the dump truck continued through a gas station, over a set of railroad tracks, coming to rest 300 feet past the intersection. The truck at this point was 407 feet from where it had first impacted another vehicle.

As a result of the accident the driver, owner, and a manager from the company involved were convicted of various criminal violations involving negligence.

The rear brakes on the dump truck were "Type 30" (30 square inches of diaphragm area) and the steer axle was equipped with "Type 16" brakes (16 square inches of diaphragm area). All brake units were equipped with automatic slack adjusters.

The post accident investigation determined that the larger rear brakes had not provided any braking force due to being severely out of adjustment. Because the larger rear brakes were not providing any brake force the smaller front brakes were trying to slow the vehicle and load (the vehicle was found to be overweight at the time of the accident). These brakes quickly overheated during the downhill braking. As a result of the overheating the front brakes "faded" and failed. At this point the vehicle had no braking power.

The fact that the rear brakes were out of adjustment was the cause of the accident, therefore the automatic slack adjusters caused the accident, right? Wrong! The brake units from the vehicle were tested by the NTSB after the accident. During the testing it was discovered that the clevises and pins that attached the brake chamber push rod to the slack adjuster were so badly worn that the automatic slack adjusters could not achieve correct adjustment. As part of the testing the clevises and pins were replaced and the automatic slack adjusters immediately brought the units into adjustment.

In short, the automatic slack adjusters had not failed. The other brake components on the truck were in such poor condition that the automatic slack adjusters could not function correctly.

The NTSB investigated the truck further and discovered that the truck had the automatic slack adjusters manually readjusted multiple times. The driver that had driven the truck the previous summer had been placed out of service due to the brakes being out of adjustment. To clear the out-of-service violation he manually readjusted the automatic slack adjusters. During that summer the driver stated he had manually readjusted the automatic slack adjusters "at least three or four more times."

Notes

Vehicle Maintenance Pro

Notes

In January, during an annual inspection, the brakes were found to be out of adjustment again. At that time the mechanic performing the inspection readjusted the automatic slack adjusters.

In April, three days before the Glen Rock accident the truck had rolled into a car. According to the driver the brakes had not “held.” It is not known if the brakes were readjusted after the incident (there is no documentation of a repair).

To sum it up, the automatic slack adjusters on the truck had been adjusted at least five times, and possibly many more times in the previous 12 months. Due to the incomplete records, it is not known exactly how many times the brakes had been adjusted. Also, the company did not include brake components (other than checking adjustment) in their preventive maintenance.

Here is the key point. No one checked the actual brake components or investigated why the automatic slack adjusters required readjusting. The manufacturer’s material warns that readjusting the automatic slack adjusters is only intended to be a “temporary fix.” The underlying cause must be corrected or the out-of-adjustment situation will return.

How could this case have ended differently?

Better records. If the carrier had been keeping better records of repairs and maintenance, and was able to see that the brakes on the truck were continually being readjusted but no other repairs were being performed, it could have triggered a more complete check of the vehicle’s brakes.

More frequent maintenance. If the carrier would have been using a more aggressive maintenance schedule (seeing the truck more often than they were) the accident could have been avoided. The carrier was faulted for not having a regular inspection and maintenance program in this case.

Accident follow up. Had the carrier followed up after the accident three days prior when the brakes did not hold, the brake problems could have easily been detected. It is a policy at many companies that any vehicle involved in an accident must undergo a maintenance inspection ASAP. This is done to check for hidden damage and to locate vehicle problems that could lead to future accidents of the same type (as happened in this case).

More complete inspections. If the carrier had used a more complete inspection checklist and better procedures, the worn clevises and pins could have been located. Locating and replacing the worn clevises and pins would have brought the brakes back into complete operation.

Violation reporting. If the carrier would have had a policy that drivers must report all roadside violations to the maintenance department, who then verified that everything had been corrected, the maintenance department might have been able to locate the defective parts.

Driver and technician training. If the technicians involved had been better trained on the basics of air brakes, in particular the basics of automatic slack adjusters, they could have detected and corrected the problem with the pins and clevises well before any accidents occurred. If the driver had been correctly trained on vehicle inspections, the driver

Shop Operations

would have spotted the worn clevises and pins, or noticed poor brake performance, and reported the problem to the maintenance department for repair.

INSIDE THE CAB

Cab

Although appearance counts a lot in publicizing your fleet's professional image, cleanliness is also the first maintenance rule for the cab. Corrosion can ruin a truck and the easiest way to fight this enemy is to keep trucks and trailers clean. Vehicles should be washed and waxed on a regular schedule to remove road dirt and salt that collects on metal surfaces and on exposed components. Accumulation of dirt not only adds weight to the vehicle, but it also increases aerodynamic drag. (A dirty vehicle doesn't do much for the company image, either.)

A drive-through washing system is adequate, but a high pressure wand-type system does a much better job of reaching undercarriage areas. The kind of washing equipment required depends on how many trucks you have and how often they are to be washed. There are many systems on the market today that use hot water, cold water, steam, or chemicals. In making a choice, you must consider water and energy costs as well as whether local regulations permit dumping wash-rack water into the sewer.

Do you have available personnel to do the washing? It takes a minimum of at least 30 minutes to wash a truck well. A wash should be the first step in a PM inspection; however, it is a good idea to inspect for vehicle leaks before the washing. Then check the area again afterward.

The inspection list should include watching for scratches on the exterior; immediate attention is required. The interior shouldn't be neglected. Drivers should be instructed to clean out the cab before they leave it after the run. (One fleet provides a vacuum cleaner for the interior and drivers are expected to use it at the terminal before they turn over the vehicle.) Interior cab cleanliness promotes respect for the driver and his or her workplace. The mechanic, too, should leave it spotless after the inspection.

Batteries

A thorough battery inspection includes visual and electrical checks. Battery connections and terminals should be cleaned; wiping off salt, dirt, and corrosion maintains the flow of power. A mild solution of baking soda and water is recommended; terminal brushes speed up the cleaning. Make sure that terminal connections are clean before installation. After connecting, coat the terminal with mineral grease or petroleum jelly. Vibration damage can be avoided by inspecting the holdowns; after battery replacement, be sure holdowns are properly torqued; overtightening these can crack the battery case.

Conventional antimony batteries require electrolyte checking; maintenance-free batteries are tested with a voltmeter. After charging, the battery ideally should be allowed to set for 5-7 days and then checked for terminal shorting. If it then reads less than the recommended minimum, it should not be used.

Shop Operations

Notes

Batteries, Continued

If the battery was charged just before the testing, it may have developed a surface charge that can affect the reading; turn on the headlights for a minute; turn them off, wait 30 seconds and then test the battery.

If the load-testing option is used, be sure mechanics are familiar with the manufacturer's instructions, because models may differ.

All routine PM inspections should include the alternator and regulator to avoid overcharged or undercharged batteries. With everything in place, run engine at fast idle for ten minutes; check alternator and regulator outputs at this time.

Since stored batteries self-discharge, they should be checked every month or so, and recharged when capacity falls below 75%. Be sure "older" batteries are checked out of inventory first; watch the warranty period.

Clean batteries/box area

Check battery box mounting/latches/condition

Specifications: Water level should be at bottom of split ring; never add electrolyte to battery already in service — water only.

Hydrometer reading should be 1.260 at 80 °F for new batteries, 1.220-1.260 at 80 °F for used. No more than .050 points between high and low readings.

Vehicle Maintenance Pro

Notes

Wheels/tires

Most wheel problems are caused by two conditions: overloading and improper maintenance. The "rules" for PM include keeping the wheels clean and tight, and making regular inspections to spot developing problems.

Encourage mechanics to inspect tires with an eye toward analyzing wear, i.e. what kind of wear indicates a balance problem? loose wheel bearings? Check for feather edges on tires resulting from incorrect toe-in or excess wear on the outside tread face which can point to a camber problem. Good tire inspection training for drivers and mechanics pays off in longer tire life.

Set a standard tread depth for removal and rotation of steer, drive, and dead axle tires, depending on type of tire and fleet operations. If you use tire pressure decals, be sure that the inspecting mechanic checks that they're present and current.

Check tires/wheels

Notes

Fifth-wheel assembly

Decide on an interval for fifth-wheel inspections and adjustments—every 30,000 miles or three months, advises one manufacturer. Steam-clean first for a better inspection. Be sure mechanics know correct lubrication procedures and that they clean off all the old grease before applying new. Lubrication should be done at least once a week.

If your fleet includes sliding fifth wheel and trailer tandems, be sure drivers are aware of the dangers of indiscriminate use. While sliders are a perfectly legal means of changing weight distribution without going in and reloading the cargo, drivers have been known to move them in order to get a better ride and to make steering easier (the weight is taken off the steering axle). The risk lies in overloading the rear drive axle of the tandem, especially if the unit is equipped with a four-spring suspension system (other suspension systems do a better job of equalizing the load on the tandem). The consequences of overloading are premature tire wear, and more importantly, shorter brake lining life and loss of brake balance.

UNDER THE VEHICLE

The braking system

Like many PM goals, extending brake component life is a shared responsibility between driver and mechanic. The supervisor also does his part by making sure that the component specs in the braking system are compatible: air chamber size, slack adjuster length or wedge angle, push-rod stroke, lining friction, rolling radius and drum type, weight and size should be identical across the braking system of each axle. Once the maintenance department provides the identical components and a secure air-line system, it's the driver's job to daily check the condition of the brakes and air lines, and balance across the system, including trailer. (Straight trucks are not as likely to have balance problems.)

Does your fleet have a procedure policy for checking brakes during the pre-trip inspection? Have drivers been instructed to drain air tanks on tractor and trailer daily to release moisture? Do they regularly examine the air lines for cracks, loose rubber, or worn parts? Have they been trained to make manual brake adjustments on tractor and trailer? Do they check trailer brake operation as part of the pre-trip inspection?

A brake has no governor or limiting device, so it will work as hard as the driver pushes it. Are drivers aware of how important good braking technique is in extending brake system life? The defensive driver plans his stops and applies the brakes gradually, coming to a safe stop. The cowboy jumps on the brakes at the last moment, pouring heat into the drum faster than it can be transferred out into the air. The heat on the drum surface will eventually cause drum cracks and failure. Drivers can check brake temperatures by feeling the drums at rest stops. (Temperatures that vary are an indication of brake imbalance.) Training a driver to carry and use a hand pyrometer to check temperature is a good idea. Drivers also need to know that brakes really don't cool all that quickly. Gearing down on hills instead of using intermittent braking to slow down the vehicle spares the service brakes.

Brake PM includes scheduled cleaning, adjusting, relining, drum reconditioning, and lubrication. And accurate recordkeeping. Any defective parts should be replaced during a PM brake inspection. You should treat each axle as a unit and make the same repairs on both brakes. Slack adjusters should also be replaced in pairs. And don't just reline; do a complete overhaul at that time.

Driveline Axle alignment is essential for good tire wear. Whenever alignment is conducted, align the drive axles as well as the front. Worn torque arm bushings can lead to drive axle misalignment; check these before trying to align the axles, and retorque all U-bolts and fasteners according to suspension manufacturers' recommendations. Lubrication is the critical PM procedure for driveline maintenance. The first oil change for new or reconditioned axle carriers should be at 1,000 miles; change filter too, if equipped. Drain oil when warm. Change axle oil (and filters) regularly — 25,000 to 30,000 miles. Axle manufacturers' instructions for type of oil, capacity, and fill procedures should be followed to the letter. They can differ. A low level may point to leaks, caused by worn or damaged seals or simply improper filling. Damage can occur during seal installation; if it's not straight in the bore, it will leak. If the bore is scratched, it will leak from the outside. Purchasing a seal driver set for this purpose discourages using the wrong tools during installation (i.e. hammer), which can ruin a new seal.		

Vehicle Maintenance Pro

Notes

Driveline, Continued

Insufficient lube, the wrong type of lube, contaminated lube, or lube with worn out additives can cause lube failure, resulting in burned lube and parts. The increased wear leads to contaminated gear oil which causes bearing failure. Dirt and moisture can enter through the breather. A magnetic drain plug capable of lifting two pounds of steel can slow down wear and is worth specifying; in fact, use them in any drain, fill, or level hole. Consider using oil analysis to help establish good change intervals. Installing axle temperature gauges is also a good idea. (Some axles have a small, tapped, plugged hole near or under the oil level hole. This is for the oil temperature sender, not to be confused with the oil level plug.)

Vibration, noise, and looseness are early signs of U-joint problems. Mechanics should look for discoloration on bearing surfaces, leaking seals, and end-play across the bearings. Lubrication intervals for U-joints and slip splines vary according to the operating environment of the truck (6000 - 8000 miles or 150 - 200 hours; 2000 - 3000 miles or 50 - 75 hours for heavy operations). When lubricating a U-joint, all four bearing seals should be flushed to get rid of abrasives (examine the purged grease to see if it's rusty or gritty) and to make sure that the bearings are completely filled.

Suspension

Suspension parts need periodic adjustment and lubrication. U-bolts should always be clamped to manufacturers' specs. For springs with eyes, make sure the pins are lubricated. (Failure to do so can lead to seizing, then breaking, thus impairing axle alignment.)

Inspection for cracks should be done regularly; cracks usually appear just outside the U-bolts that clamp the spring to the axle. The main leaf, usually the longest, is generally the first to go. There are some guidelines for spring rebuild vs. replacement.

If breakage occurred between the U-bolts, it was probably caused by the loose U-bolts and the spring can possibly be rebuilt. If breakage occurred between a U-bolt and the end of the spring, it was probably caused by fatigue and the spring should probably be replaced. Replace medium-duty multileaf and heavy-duty long taper front springs; rear springs are often rebuilt. Three-leaf trailer springs are commonly replaced and all broken single-leaf trailer springs are usually replaced. A spring rebuilt once should not be rebuilt again. If a spring breaks and the suspension is nearing the end of a normal service life, replace all the springs to avoid downtime later. Know what kind of service life to expect from springs installed on your trucks.

Transmission

Drivers should monitor changes in transmission operation, such as noise, jumping out of gear, sticking, hard shifting and watch closely for any sign of leaks. Correct operation is essential to long transmission life.

Lubrication is the primary concern of PM; transmission lubricant must be kept at the proper level (overfilling must be avoided); types and brands of oil shouldn't be combined. Operating temperatures can affect certain oils, so external coolers or more frequent oil changes should be used when the truck:

- operates consistently at lower speeds on grades;
- operates in high ambient temperatures;
- has the transmission located too close to the exhaust system or with restricted air flow around it.

Clutch

Drivers should report changes in clutch operation immediately so that mechanics can make the necessary inspection, adjustments, and lubrication. Drivers should also be aware that type of clutch facing makes in difference in operation; a ceramic-type clutch has a shorter slip period and engages more firmly than the organic-type facings. They should also check the amount of travel in the pedal on a daily basis because this is a key to the condition of the clutch and release mechanism. High-temperature lubricants, not a chassis lubricant, should always be used with the clutch.

The steering system

The steering system starts at the steering wheel and ends with the wheels on the road. Your steering maintenance problems are probably at either end of the system, too. Your ally in correcting steering problems is the driver at the wheel. One steering system manufacturer estimates that 99% of driver steering complaints are legitimate and deserve to be checked out immediately. Is there a communication problem

The steering system, Continued

sometimes on the DVIR? Because a driver is often less than specific about a steering problem, Air-O-Matic Power Steering Company has published a pamphlet that defines some terms that a driver can use to describe symptoms correctly:

Hard steering	Excessive effort required to turn steering wheel;
Darting	Sudden change in direction without obvious cause;
Oversteering	Turning farther than desired;
Wandering	Random straying from a straight course;
Free play	Movement of steering wheel without resistance;
Wheel recovery	Normal tendency of front wheels to straighten out after a turn;
Leading	Constant veering in the same direction;
Shimmy	Abnormal vibration felt in the front wheels;
Knotty feel	Uneven resistance to turning of steering wheel.

At the other end of the system are the wheels and tires. Alignment is crucial to correct steering — and especially good tire life—so it should be checked often.

Drivers and mechanics should know how to “read” tire wear patterns as clues to alignment problems. And alignment specs must be maintained; changing the toe specs to correct wander is not a solution. (Although giving more steering stability, it increases tire wear.) PM should include checking alignment specs (especially toe, which decreases normally as parts wear) as often as 3-4 months for a linehaul unit and every time steer axle tires are replaced.

PM for the linkages between “wheels” amounts to lots of lubrication and periodic adjustments. PM inspections should check for wear in ball joints, tie-rod ends, and drag link ends, although by that time you will probably have heard from the driver. Steering system experts recommend checking steer axle specs (watch for overloading), lubricating U-joints more often if they are particularly accessible to road spray, and greasing kingpins twice—with vehicle jacked up and on the floor.

Check for condition (looseness and wear):

- Tie-rods/ball joints
- Drag link/ball joints
- Link rod ends/ball joints
- Pitman arm
- Steering shaft U-joints/pinch bolts (proper torque: 40-45 lb/ft)
- Steering shaft slip joints

Engine

The engine manufacturer is the best source for maintenance information and intervals. Regular diagnostic tests of the different engine components should be scheduled at PM service intervals. A daily check of the engine by the driver for loose or worn parts pays off in prevention of premature engine failure. Such a check includes:

- checking for excessive use or leak of oil/air/water/fuel;
- checking the cooling system for coolant level, cleanliness of radiator core, and radiator cap seal condition and tightness;
- listening to the engine for any unusual noise;
- checking the fuel pressure gauge with the engine running;
- checking air cleaner indicator with engine running;
- spending a few minutes cleaning the engine compartment to make inspection easier and to improve appearance.

Engine lubricating system

Oil changes are basic to PM (most camshaft and crankshaft failures can be traced to some kind of oil problems). Be sure that drivers are trained to check oil level daily and in the proper manner. Only good grade oil of the proper viscosity should be used. Timing of changes can be scheduled according to mileage, hours of engine use, months of service, or even on gallons of fuel used. The longest but still safest oil change interval occurs just before contamination. Oil analysis can help to determine that point by monitoring how much contamination is present in the oil, i.e. how well it is holding up. Oil analysis can test for:

- viscosity; if it increases too much, the oil is oxidized and must be changed. Too-thin oil points to fuel dilution, which is usually caused by a mechanical problem or excessive idling.
- water; most water from the combustion gases go out in the exhaust, but some gets into the oil. Too much can mean a leak in the coolant system, poor combustion, etc.
- antifreeze; if present, the oil must be changed immediately and tested again. If the presence continues, there's bigger trouble (probably blown head gaskets).
- solids; fuel soot, carbon, etc. are normal products of engine operation, but if solids show up consistently in your oil analysis, the oil-change interval should be decreased.
- metals; normal engine wear results in metal particles wearing away; oil keeps these particles in suspension until they can be removed by an oil filter. But identification of the particles can also give clues as to

Notes

Engine lubricating system, Continued

where the wear is taking place; i.e. iron wear from cylinders, pistons, valve train, and crank; copper-wear from piston bushings, etc.

- silica; dirt may be entering the air intake system, so checking hoses, seals, and filters would be in order.

Laboratories differ as to the detail of analysis offered; a variety of do-it-yourself kits are also coming on the market. Using manufacturer's data to establish oil and filter changes and then waiting until oil analysis indicates a change can help determine an interval that's right for your vehicle. In fact, oil analysis is particularly critical for the small fleet; a single vehicle downtime can represent a greater percentage of loss of business.

A good PM inspection and service program can be even more helpful if combined with oil analysis. (Fuel, lubricant, etc. analyses are also available.) Such substance reports help you in making decisions about component replacement or engine overhaul, for example.

Some fleets use oil analysis to eliminate the "A" service and instead perform a more thorough "B." The oil change interval can be extended because changes in the oil (solids accumulation, coolant leaks, percentage of water present, etc.) are immediately revealed. And the hour spent on the oil and filter changes can be used in other ways, say the maintenance people. Check out the manufacturers; they may offer free analysis if you use their products.

Change engine oil and filters

Check oil lines/condition (tightness)

Check area for oil leaks

Check oil level/condition

The fuel system

Some fleets swear by fuel analysis to ensure that no contaminants are present in the fuel supply. Samples are taken from the bottom of storage tanks and tested for water, sediment, and microbial contamination. Testing of storage tanks for signs of leaks and ground seepage and inspection of storage tank pump filters help keep fuel pure. Some fleets also take samples from each fuel delivery (from the first two minutes of pouring). The filler neck area and delivery truck's hose should be clean. In short, all fuel-related hardware should be kept clean and in good condition.

Shop Operations

Notes

The fuel system, Continued

Fuel filters. Gasoline is a clean fuel and easier to filter than diesel, so unless the gas picks up water from a storage tank, the filter handling the fuel can go a long time without a change. Diesel, on the other hand, absorbs water easily and contains certain chemical constituents which tend to precipitate out of the fuel at different temperatures. Since water is particularly harmful, a fuel/water separator can keep fuel "clean."

A change interval for fuel filters is more difficult to determine. Engine manufacturers' recommendations are naturally to be observed; gauges can indicate a time for change as can fleet experience. Fuel additives can be very helpful especially in warm or humid climates. Fuel pumps should be tested for delivery rates, vacuum pressure, and volume. To help eliminate pump and injection problems, keep injectors adjusted (every 50,000 miles) and filter fuel well. And all hoses, lines, and connections should be regularly inspected for leaks.

Change fuel filters

Drain fuel/water separator (especially during winter)

Check fuel lines/condition (tightness, cracks, leaks, routing)

Check fuel heater/operation

The air-intake system

Unlike oil and fuel filters, air filters suffer from over-servicing; in a sense, they work better with age. They are changed when the level of air restriction has caused an increase in fuel consumption to the point where the cost of a new element is offset by improvement in fuel economy. So the restriction gauge plus the fleet's fuel and mileage records give clues to the change interval. The filter element should be inspected at every oil change and replaced at 50,000 to 70,000 miles. (Filter life is probably 100,000 miles, but at this point there's a sufficient decline in fuel economy to merit the new filter investment.)

Check air cleaner restriction gauge

The engine cooling system

Cooling system maintenance prevents premature engine wear by removing tremendous amounts of engine heat. The principal parts of the system include the coolant hoses, the drive belts, the thermostat, the water pump, the radiator, the engine water jacket and cooling passages, and the liquid coolant. Each of these items deserves a word.

The engine cooling system, Continued

Hoses: PM is the best way to avoid hose breakdown; all coolant hoses should be replaced during a major overhaul. Their condition must be checked regularly. Train drivers to watch for following conditions during inspection.

Tears or splits in hoses result from internal or external hose failure caused either by deterioration of the coolant (anti-freeze), or by too much fluid pressure.

Soft hose with swelling happens when the interior fabric reinforcement starts to separate and the outside rubber material stretches and eventually ruptures.

Hardened hose comes from heat—either from hot summer weather or, more likely, from excessive engine heat. The hose becomes brittle and breaks as a result of vibration.

Soft, spongy hose has been exposed to leaking engine oil or power-steering fluid.

Drive belts: Failure to maintain proper belt tension (too low, too tight) is the major service problem with belts (as is failure to include a readjustment after a new installation). Mismatched belts in multiple belt drive sets can cause problems; matched sets should be replaced that way. Check manufacturer's specs to be sure that a new belt is the right type; improper installation procedures can also shorten belt life. Many fleets replace belts every 100,000 miles regardless of condition.

High temperatures inside smaller engine compartments can still lead to hard and cracked belts, despite new rubber compounds. And if a belt becomes soaked with oil or fuel, it cannot grip the pulley correctly. Contamination of the belt by coolant solutions will also make it slip.

Thermostat: Industry experts remind us that a thermostat is not designed to control the maximum engine temperature; rather, it controls the minimum temperature so that the engine doesn't run too cool (leading to poor engine performance and lube oil contamination). So when a thermostat fails, the engine may already have experienced overheating.

Thermostats can be checked by submerging in water, gradually heating the water, and checking when the thermostat opens. Normal life is about two years for medium-duty vehicles and one to two years or about 200,000 miles for heavy-duty trucks; however, particles circulating in the coolant system can affect this life. Why take a chance. If the driver or mechanic suspects that an engine is running too hot or too cold and that the thermostat is not operating correctly, replace it to be sure.

Water pump: You can usually spot a leaking water pump seal. However, sometimes a pump seal will leak air into the coolant, which can reduce cooling capacity, promote oxidation, and lead to pitting of the cylinders. Checking for air bubbles rising to the surface of the coolant in the top of

Vehicle Maintenance Pro

Notes

The engine cooling system, Continued

the radiator when the engine is running is the first step. If the bubbles stop when the fan belt is removed and the engine operated for a minute (the water pump is stopped), that's a good clue to water-pump air leak.

Radiator: Good air flow through the radiator is essential to proper cooling, so thorough inspection of the fins is essential. Bent or damaged fins should be straightened for maximum air flow. Drivers should assist in this task, especially in summer when more insects are trapped in the radiator. Cooling systems must be air-tight as well as fluid-tight at all times, so piping and caps must be secure and tight. Pressure-testing the system checks for leaks.

Water jacket/passages: Rust or scale can be deposited on the walls of the engine jacket, the cylinder head cooling passages, and the radiator core. It can be seen by looking inside the radiator cap or into the water jacket (when the thermostat housing or water pump is removed). Cleaning products can be added to the coolant (not all antifreeze products contain a conditioner to prevent corrosion and pitting), or a filter can be used.

The coolant: Chemical analysis of coolant samples can help identify cooling-system problems just like oil analysis shows internal engine wear. The programs offered vary from routine PM to failure analysis of the cooling system.

Use of permanent type anti-freeze for too long a period of time can result in a high acid content in the coolant or rust formation because the coolant additives are finally depleted. Anti-freeze called "permanent" should not be used indefinitely; its life is only one full winter unless new protective additives or a chemically treated water filter is used (the chemical is slowly released as the coolant passes through the filter).

Gasoline engines

Diesel engines are moving into applications that have typically been gas-powered in the past. However the gasoline engine is still around; it, too, must be spec'ed and maintained.

Among the new spec'ing options are fuel injection, turbocharging, and electronic ignition, of which the latter is a very popular choice today. Spec'ing this system does away with the normal 15,000-mile tune-up replacement of points, spark plugs, etc.

Vehicle Maintenance Pro

Notes

Gasoline engines, Continued

Maintenance, specifically PM, revolves around oil changes and tune-ups. The most common tune-up interval is still 10,000 to 15,000 miles, although some maintenance supervisors claim to be able to extend that time to 20,000 miles. Check manufacturers' recommendation for proper mileage and time intervals. The carburetor and electrical system pose the greatest maintenance problems. And the exhaust system continues to give trouble to managers who wrestle with balancing emissions control requirements with engine performance.

TRAILER

Trailer

Trailers are usually seen less often by the shop, but they should have their own PM inspection and service schedule. The frequency depends on the type of trailer and where they operate. Manufacturer's recommendations are the first source of information, supplemented by your own records. Like the tractor, the trailer is subject to inspection and maintenance regulations, so your trailer records provide documentation and an equipment history.

Fleets differ as to the PM inspection interval. One fleet tried inspecting every 30 days, but found that some trailers were being serviced too often. A 10,000-mile interval works best for them. Another example is based on operating a trailer for 30,000 miles per year: a PM appointment every two or three months works well.

Chassis lubrication, a very important part of trailer PM, varies too. One fleet lubes before every trip; another at 5,000-mile intervals. You will have to determine the schedule that is best for your equipment. Lubrication, axle fluid level, and brake adjustment are items that require particular attention — even between normal inspection intervals. Prior to the PM inspection, the trailer should be cleaned, including undercarriage and suspension.

Axle/alignment

Axle alignment is one of the most critical adjustments made on a trailer and it should be checked at least once a year and any time a problem arises. When abnormal tire wear is observed or an axle or suspension component is replaced or modified, the alignment must also be checked. Drivers should be sensitive to trailer action and report any abnormal movement, i.e. dog tracking.

Ensure that axle lubrication is maintained by checking wheels, hubcaps, and axles regularly for oil leaks. Regular PM also includes greasing the axle camshaft.

Check axle/condition
Check axle fluid level
Check axle/alignment/front axle/kingpin
Check axle/alignment/rear axle (tandem) to front axle

Brakes

Brake balance between tractor and trailer is a problem for all fleets today; it's minimized a bit if "foreign" trailers aren't run with your fleet's tractors and you thus have control over both parts of the unit.

A trailer PM shop inspection or service always includes a brake inspection and adjustment. Do you change brakes by mileage? Although brake lining should never be less than 1/4" thickness, some fleets change linings when 3/8" is reached. And usually shoes on all four brakes are changed at the same time (at a minimum, both brakes on the axle).

Trailer air tanks should be drained daily to remove water and other contaminants. The driver should always check gladhands to make sure that the seal, housing, and air lines are in good condition.

Drain air tanks

- check condenser/evaporator fan/operation;
- check thermostat to see if the cycle sequence is functioning properly;
- check ducts/drains;
- precool/defrost as indicated.

An on-the-road checklist includes:

- check engine water temperature gauge;
- check refrigerant level;
- check thermometer calibration;
- check manual defrost/operation/light/defrost termination thermostat.

A PM inspection/service checklist should be developed for refrigeration units whether they are serviced in the shop or sent out for repair. Look to manufacturer's recommendations for guidelines.

COMPLIANCE DATES – INSPECTIONS AND TEST UNDER §180.407(c)

Test or inspection (cargo tank specification, configuration, and service)	Date by which first test must be completed (see note 1)	Interval period after first test
External Visual Inspection: All cargo tanks designed to be loaded by vacuum with full opening rear heads	September 1, 1991	6 months.
All other cargo tanks	September 1, 1991	1 year.
Internal Visual Inspection: All insulated cargo tanks, except MC 330, MC 331, MC 338 (See Note 4)	September 1, 1991	1 year.
All cargo tanks transporting lading corrosive to the tank	September 1, 1991	1 year.
All other cargo tanks except MC 338	September 1, 1995	5 years.
Lining Inspection: All lined cargo tanks transporting lading corrosive to the tank	September 1, 1991	1 year.
Leakage Test: MC 330 and MC 331 cargo tanks in chlorine service	September 1, 1991	2 years.
All other cargo tanks except MC 338	September 1, 1991	1 year.
Pressure Test: (Hydrostatic or pneumatic) (See Notes 2 and 3) All cargo tanks which are insulated with no manhole or insulated and lined, except MC 338	September 1, 1991	1 year.
All cargo tanks designed to be loaded by vacuum with full opening rear heads	September 1, 1992	2 years.
MC 330 and MC 331 cargo tanks in chlorine service	September 1, 1992	2 years.
All other cargo tanks	September 1, 1995	5 years.
Thickness Test: All uninsulated cargo tanks transporting material corrosive to the tank, except MC 338	September 1, 1992	2 years.

Note 1: If a cargo tank is subject to an applicable inspection or test requirement under the regulation in effect on December 30, 1990, and the due date (as specified by a requirement in effect on December 30, 1990) for completing the required inspection or test occurs before the compliance date in this table, the earlier date applies.

Note 2: Pressure testing is not required for MC 330 and MC 331 cargo tanks in dedicated chlorine service.

Note 3: Pressure testing is not required for uninsulated lined cargo tanks with design pressure or MAWP of 15 psig or less, which receive an external visual inspection and lining inspection at least once each year.

Note 4: Insulated cargo tanks equipped with manholes or inspection openings must conform either an internal visual inspection in conjunction with the external visual inspection, or a hydrostatic or pneumatic pressure-test of the cargo tank.

§180.407(h)(4)

(4) After July 1, 2000, Registered Inspectors of specification MC 330 and MC 331 cargo tanks, and nonspecification cargo tanks authorized under §173.315(k) of this subchapter must visually inspect the delivery hose assembly and piping system while the assembly is under leakage test pressure utilizing the rejection criteria listed in §180.416(g). Delivery hose assemblies not permanently attached to the cargo tank motor vehicle may be inspected separately from the cargo tank motor vehicle. In addition to a written record of the inspection prepared in accordance with §180.417(b), the Registered Inspector conducting the test must note the hose identification number, the date of the test, and the condition of the hose assembly and piping system tested.

§180.415 Test and inspection markings.

(a) Each cargo tank successfully completing the test and inspection requirements contained in §180.407 must be marked as specified in this section.

(b) Each cargo tank must be durably and legibly marked, in English, with the date (month and year) and the type of test or inspection performed, subject to the following provisions:

(1) The date must be readily identifiable with the applicable test or inspection.

(2) The markings must be in letters and numbers at least 32 mm (1.25 inches) high, near the specification plate or anywhere on the front head.

(3) The type of test or inspection may be abbreviated as follows:

- V for external visual inspection and test;
- I for internal visual inspection;
- P for pressure test;
- L for lining inspection;
- T for thickness test; and
- K for leakage test for a cargo tank tested under §180.407, except §180.407(h)(2); and
- (vii) K-EPA27 for a cargo tank tested under §180.407(h)(2) after October 1, 2004.

Examples to paragraph (b). The markings "10-99 P, V, L" represent that in October 1999, a cargo tank passed the prescribed pressure test, external visual inspection and test, and the lining inspection. The markings "2-00 K-EPA27" represent that in February 2000, a cargo tank passed the leakage test under §180.407(h)(2). The markings "2-00 K, K-EPA27" represent that in February 2000, a cargo tank passed the leakage test under both §180.407(h)(1) and under EPA Method 27 under §180.407(h)(2).

§180.416 Discharge system inspection and maintenance program for cargo tanks transporting liquefied compressed gases.

(a) *Applicability.* This section is applicable to an operator using specification MC 330, MC 331, and nonspecification cargo tanks authorized under §173.315(k) of this subchapter for transportation of liquefied compressed gases other than carbon dioxide. Paragraphs (b), (c), (d)(1), (d)(5), (e), (f), and (g)(1) of this section, applicable to delivery hose assemblies, apply only to hose assemblies installed or carried on the cargo tank.

(b) *Hose identification.* By July 1, 2000, the operator must assure that each delivery hose assembly is permanently marked with a unique identification number and maximum working pressure.

(c) *Post-delivery hose check.* After each unloading, the operator must visually check that portion of the delivery hose assembly deployed during the unloading.

(d) *Monthly inspections and tests.* (1) The operator must visually inspect each delivery hose assembly at least once each calendar month the delivery hose assembly is in service.

(2) The operator must visually inspect the piping system at least once each calendar month the cargo tank is in service. The inspection must include fusible elements and all components of the piping system, including bolts, connections, and seals.

(3) At least once each calendar month a cargo tank is in service, the operator must actuate all

emergency discharge control devices designed to close the internal self-closing stop valve to assure that all linkages operate as designed. Appendix A to this part outlines acceptable procedures that may be used for this test.

(4) The operator of a cargo tank must check the internal self-closing stop valve in the liquid discharge opening for leakage through the valve at least once each calendar month the cargo tank is in service. On cargo tanks equipped with a meter, the meter creep test as outlined in Appendix B to this part or a test providing equivalent accuracy is acceptable. For cargo tanks that are not equipped with a meter, Appendix B to this part outlines one acceptable method that may be used to check internal self-closing stop valves for closure.

(5) After July 1, 2000, the operator must note each inspection in a record. That record must include the inspection date, the name of the person performing the inspection, the hose assembly identification number, the company name, the date the hose was assembled and tested, and an indication that the delivery hose assembly and piping system passed or failed the tests and inspections. A copy of each test and inspection record must be retained by the operator at its principal place of business or where the vehicle is housed or maintained until the next test of the same type is successfully completed.

(e) *Annual hose leakage test.* The owner of a delivery hose assembly that is not permanently attached to a cargo tank motor vehicle must ensure that the hose assembly is annually tested in accordance with §180.407(h)(4).

(f) *New or repaired delivery hose assemblies.* Each operator of a cargo tank must ensure each new and repaired delivery hose assembly is tested at a minimum to 120 percent of the hose maximum working pressure.

(1) The operator must visually examine the delivery hose assembly while it is under pressure.

(2) Upon successful completion of the pressure test and inspection, the operator must assure that the delivery hose assembly is permanently marked with the month and year of the test.

After July 1, 2000, the operator must complete a record documenting the test and inspection, including the date, the signature of the inspector, the hose owner, the hose identification number, the date of original delivery hose assembly and test, notes of any defects observed and repairs made, and an indication that the delivery hose assembly passed or failed the tests and inspections. A copy of each test and inspection record must be retained by the operator at its principal place of business or where the vehicle is housed or maintained until the next test of the same type is successfully completed.

(g) *Rejection criteria.* (1) No operator may use a delivery hose assembly determined to have any condition identified below for unloading liquefied compressed gases. An operator may remove and replace damaged sections or correct defects discovered. Repaired hose assemblies may be placed back in service if retested successfully in accordance with paragraph (f) of this section.

(i) Damage to the hose cover that exposes the reinforcement.

(ii) Wire braid reinforcement that has been kinked or flattened so as to permanently deform the wire braid.

(iii) Soft spots when not under pressure, bulging under pressure, or loose outer covering.

(iv) Damaged, slipping, or excessively worn hose couplings.

(v) Loose or missing bolts or fastenings on bolted hose coupling assemblies.

(2) No operator may use a cargo tank with a piping system found to have any condition identified in this paragraph (g)(2) for unloading liquefied compressed gases.

(i) Any external leak identifiable without the use of instruments.

(ii) Bolts that are loose, missing, or severely corroded.

(iii) Manual stop valves that will not actuate.

(iv) Rubber hose flexible connectors with any condition outlined in paragraph (g)(1) of this section.

(v) Stainless steel flexible connectors with damaged reinforcement braid.

(vi) Internal self-closing stop valves that fail to close or that permit leakage through the valve detectable without the use of instruments.

(vii) Pipes or joints that are severely corroded.

LIGHTWEIGHT VEHICLE SAFETY REPORT

(For Routine Vehicle Safety Check or Inspection)
✓ Applicable column if item is "OK" or "Needs Repair"

COMPANY NAME		VEHICLE NO.	MILEAGE	DATE
YEAR	MAKE	MODEL	INSPECTED BY:	
OK	NEEDS REPAIR	ITEM	CAB INSPECTION	
		DASHBOARD WARNING LIGHTS	All dashboard warning lights should light up when engine is cranking and parking brake is on.	
		HORN	Gives adequate and reliable warning signal.	
		WINDSHIELD WASHERS AND WIPERS	Do washers work? Do wipers clean the windshield? A clear clean windshield is a must for safe driving.	
		WINDSHIELD AND WINDOWS	No cracks in windshield over ¼" wide, no intersecting cracks, no objects or stickers on windshield or windows which impair vision.	
		SEAT BELTS	Available & buckles work easily. Driver note: USE THEM!	
		REAR VIEW MIRRORS	Firmly attached and reflect view behind vehicle.	
		BRAKES	① Push pedal down, if it goes down more than ½ way to the floor, brakes need adjustment. ② Push pedal down hard and hold down and count to 10, if the pedal keeps going down, have it repaired immediately. (For vehicles with power brakes, engine must be running for this test.) ③ Drive vehicle and step on brakes, if vehicle swerves to the side or anything feels suspicious, have checked.	
		PARKING BRAKE	Stop vehicle, set parking brake firmly and attempt to move vehicle in "drive" or "first". If vehicle moves forward easily, the brakes need adjustment or repair.	
		SPEEDOMETER	Check while vehicle is moving - must register M.P.H.	
		CAB-GENERAL	Objects in cab must not obstruct drivers vision or prevent free movement or exit from vehicle. NOTE: Remove any object from the dash, visors or seat which could fly around the cab and injure the driver, if vehicle stops suddenly or an accident occurs.	
OK	NEEDS REPAIR	ITEM	OUTSIDE VEHICLE INSPECTION	
		LIGHTS	Get helper to check headlights (high and low beam), emergency flashers, side markers, parking lights, license plate lights, tail lights, brake lights, back-up lights (shift to reverse) turn signals (front and back) and interior dash lights.	
		TIRES	① Check tire pressure with gauge for correct pressure. ② Check tread wear. (Tread wear indicators will show up when tread gets down to last ⅛ inch, indicators showing across two or more grooves means tire should be replaced.) ③ Check both sides of tire for bulges or large cracks on sidewall.	
		SHOCK ABSORBERS	Bounce vehicle up and down at each wheel. If vehicle continues to bounce two or more times after you let go, shocks are weak and will cause unnecessary tire wear and handling problems.	
OK	NEEDS REPAIR	ITEM	UNDER VEHICLE INSPECTION	
		BRAKE LINES	Check for apparent fluid leaks on brake lines and cylinders.	
		GAS TANK	Check for leaks and must have securely attached gas cap.	
		OIL LEAKS	Look for oil leaks under transmission, engine and differential.	
		WATER LEAKS	Look for water leaks under radiator – NOTE: clear, condensed drops from air conditioner is O.K.	
		EXHAUST SYSTEM	Check complete exhaust system, muffler, tail pipes, exhaust pipe for any exhaust leaks.	
Deficiencies Corrected Signed:			Vehicle OK To Operate Signed:

Shop Operations

VEHICLE SAFETY REPORT

(For Routine Vehicle Safety Check or Inspection)
✓ Applicable column if item is "OK" or "Needs Repair"

COMPANY NAME		VEHICLE NO.	MILEAGE	DATE
YEAR	MAKE	MODEL	INSPECTED BY:	
OK	NEEDS REPAIR	ITEM	CAB INSPECTION	
		PARKING BRAKE	Must be adequate to hold vehicle on any grade operated free from ice or snow.	
		AIR PRESSURE READING PSI (fully charged)	Air pressure gauge reading in PSI required.	
		LEAKAGE TESTS	Serious air losses are imminently hazardous and are likely to cause accident or breakdown. Procedure: with engine stopped and no brakes applied, observe gauge reading - loss should not exceed 3 lbs. per minute; apply full brakes for 2 minutes - loss should not exceed 4 lbs. per minute (if loss exceeds limits, check out further before leaving terminal).	
		WARNING DEVICE	Must be visible or audible and operate at all pressures at and below 50% of cut out pressure. Pressure Build Up Test: run engine at fast idle; time to raise pressure to cut out should not exceed 5 minutes.	
		SPEEDOMETER	Must register mph.	
		HORN(s)	Required to give adequate and reliable warning signal and be in proper working order.	
		WINDSHIELD WIPERS	Two required, unless one clears all but one inch at right and left sides.	
		WINDSHIELD & WINDOWS	No cracks in windshield over 1/4 inch wide; no intersecting cracks; damage to windshield must be small enough to cover with a penny. No vision reducing objects or stickers on windows, either side of driver's compartment; stickers required by law permitted on windshield, but must be within 4 1/2 inches from bottom of windshield.	
		REAR VISION MIRRORS	Two required, one on each side, firmly attached and must reflect a view of highway along both sides of vehicle.	
		TRAILER EMERGENCY BRAKING DEVICE	Clear indication of emergency position or method or operation is required; manual control device must be operable from driver's seat.	
		CAB - GENERAL	Objects in the cab must not obscure driver's vision, prevent driver's ready access to emergency items or interfere with driver's free movement or exit from cab. Sleeper berth restraints required on vehicles built after July 1, 1971. Driver's seat belts required in 1965 and newer units (DRIVER NOTE: USE THEM!)	
		EMERGENCY EQUIPMENT	Emergency equipment is required as follows: fire extinguisher must be properly filled, securely mounted and manufactured in a manner for visual inspection - power units not transporting hazardous materials must carry either one extinguisher with a UL Rating of 5 B:C, or two extinguishers with UL Rating of 4 B:C or more - power units transporting hazardous materials of substance and quantity to require placarding must carry one fire extinguisher with a UL Rating of 10 B:C or more. At least one spare fuse must be carried if not equipped with circuit breakers. Warning devices: three bidirectional emergency reflective triangles are required for vehicles equipped with warning devices after January 1, 1974; however, vehicles equipped with warning devices before January 1, 1974 may continue to use one of the following combinations until they need replacement, at which time they may continue to be carried only as a supplement to three bidirectional reflective triangles: 3 flares, 3 fuses, 2 red flags (at least 12" square); 3 red electric lanterns, 2 red flags; 3 red reflective triangles.	
OK	NEEDS REPAIR	ITEM	FRONT END INSPECTION	
		HEADLAMPS	At least two headlamps are required; in any event, there must be an equal number on each side with upper and lower beam selectable at driver's will.	
		CLEARANCE LAMPS	 Truck-tractors (over 80 inches in width): 2 clearance lamps, amber in color; 3 identification lamps, amber in color; 2 turn signals, amber in color and one on each side (must have switch to flash simultaneously as a traffic hazard warning system, must be capable of operating with ignition on or off). Semitrailers & trailers: 2 clearance lamps, amber in color.	
		TIRES	No tire shall have fabric exposed thru thread or sidewall or have less than 2/32nd inch tread depth; front tire on power unit must not be regrooved and must have at least 4/32nd inch of tire depth.	
		WHEELS	Check for cracks, loose lug nuts or missing studs - these are imminently hazardous conditions which are likely to cause an accident or breakdown.	
		BRAKE TUBING & HOSE	Check for chafing, kinking or other mechanical damage - connections must be free from leaks.	
		BRAKES	Brakes are required on all wheels (1980 and newer), except that 3-axle power units need not have brakes on front axle (1979 and older). All required brakes must be operative. Check brake drums, chambers & component parts - cracked or broken drums, blown diaphragms, other chamber leaks, missing or broken or disconnected parts are all imminently hazardous conditions and should be checked and corrected before leaving terminal.	
		STEERING	Check for loose or missing nuts and bolts or positioning parts for steering column or gear box; excessive play; steering should turn full right and left - correct hazardous condition before leaving terminal.	

127-F Rev. 7/94

Notes

OK	NEEDS REPAIR	ITEM	LEFT SIDE INSPECTION
		FUEL TANK	Check for leaks; must have securely attached tank cap.
		SIDEMARKER LAMPS & REFLECTORS	Truck-tractors, no requirements. Semitrailers and trailers: side-marker lamps, one amber in front, one red at rear: reflectors all mounted not more than 60 inches high, one amber in front, one red at rear (one additional amber side-marker and one additional amber reflector required at intermediate position on semitrailers & trailers over 30 ft. long). Lamps & reflectors must not be obscured by other parts of the vehicle or load or dirt, etc.
		BATTERY	Must be covered, unless located in engine compartment or covered by a fixed part of the vehicle.
OK	NEEDS REPAIR	ITEM	REAR OF POWER UNIT INSPECTION
		LAMPS & REFLECTORS	Truck-tractors: one tail lamp, one stop lamp, two reflectors-one at each side, all red in color; if front turn signals are not double-faced and visible to passing drivers, two turn signals one at each side are required. License plate lamp - white.
		TIRES, WHEELS, BRAKE TUBING & HOSE, BRAKES, including drums, chambers & component parts	Check thoroughly as required for front end inspection.
		WIRING	Check for bare, loose, dangling, chafing or poorly connected wires and correct if necessary.
		SUSPENSION SYSTEM	Check for broken leaves, missing or loose U-bolts or other defective conditions likely to cause an axle shift - these can be hazardous conditions which may cause an accident or breakdown.
		FIFTH WHEEL	Lower half should be securely affixed by U-bolts or other secure means - lower half must not shift on frame; check for cracks, loose or missing mounting brackets, missing or inoperative locking devices - each of these could cause an accident or breakdown.
OK	NEEDS REPAIR	ITEM	REAR OF TOWED UNIT INSPECTION
		LAMPS & REFLECTORS	Semitrailers & Trailers: 2 tail lamps-one at each side, 2 stop lamps-one at each side, 2 turn signals-one at each side, 2 clearance lamps-one at each side, 2 reflectors-one at each side, 3 identification lamps on vertical centerline (all red in color). License plate lamp - white.
		TIRES, WHEELS, BRAKE TUBING & HOSE, BRAKES, including drums, chambers & component parts	Check thoroughly as required for front end inspection.
		WIRING & SUSPENSION SYSTEM	Check thoroughly as required for rear of power unit inspection.
OK	NEEDS REPAIR	ITEM	RIGHT SIDE INSPECTION
		SIDEMARKER LAMPS & REFLECTORS	Check for same requirements as left side inspection
		FUEL TANK	Check for same requirements as left side inspection
		EXHAUST SYSTEM	Must not cause burning, charring, or damage to electrical wiring, the fuel supply or any combustible part of the vehicle. Exhaust system not securely fastened or leaking forward of or under cab constitutes a hazardous condition.
		CONTROL (Service) & SUPPLY (Emergency) HOSES & CONNECTIONS	Must be secured against chaffing, kinking or other mechanical damage - must not drag on frame, fuel tank, deck plate, etc. Connections should be checked for leaks: there should be suitable provision to prevent accidental disconnection.
		BREAKAWAY & EMERGENCY BRAKING (Disconnect lines)	Trailer brakes must apply immediately upon disconnecting - no back flow of air from trailer or air flow from the tractor should exist.
		DETACHABLE ELECTRICAL CONNECTIONS	Detachable connections made by twisting together wires from towing and towed units are prohibited; wiring must be contained in a cable or cables or entirely within a substantially constructed protective device; check for incorrect connection or accidental disconnection. Check for bare, loose, dangling, chafing or poorly connected wires.

VEHICLE COMPONENTS INSPECTED		mark X	Yes, ok; X	No, not ok; X	Does not apply
OKAY		OKAY			
YES	NO	YES	NO		
	1. BRAKE SYSTEM			7. STEERING MECHANISM	
	a. Service brakes			a. Steering wheel free play	
	b. Parking brake system			b. Steering column	
	c. Brake drums or rotors			c. Front axle beam and all steering components other than steering column	
	d. Brake hose			d. Steering gear box	
	e. Brake tubing			e. Pitman arm	
	f. Low pressure warning device			f. Power steering	
	g. Tractor protection valve			g. Ball and socket joints	
	h. Air compressor			h. Tie rods and drag links	
	i. Electric brakes			i. Nuts	
	j. Hydraulic brakes			j. Steering system	
	k. Vacuum systems				
	2. COUPLING DEVICES			8. SUSPENSION	
	a. Fifth wheels			a. Any U-bolt(s), spring hanger(s), or other axle positioning part(s) cracked, broken, loose or missing resulting in shifting of an axle from its normal position.	
	b. Pintle hooks			b. Spring assembly	
	c. Drawbar/towbar eye			c. Torque, radius or tracking components	
	d. Drawbar/towbar tongue				
	e. Safety devices				
	f. Saddle-mounts				
	3. EXHAUST SYSTEM			9. FRAME	
	a. Any exhaust system determined to be leaking at a point forward of or directly below the driver/sleeper compartment.			a. Frame members	
	b. A bus exhaust system leaking or discharging to the atmosphere in violation of standards (1), (2) or (3).			b. Tire and wheel clearance	
	c. No part of the exhaust system of any motor vehicle shall be so located as would be likely to result in burning, charring, or damaging the electrical wiring, the fuel supply, or any combustible part of the motor vehicle.			c. Adjustable axle assemblies (Sliding subframes)	
				10. TIRES	
				a. Tires on any steering axle of a power unit	
				b. All other tires	
	4. FUEL SYSTEM			11. WHEELS AND RIMS	
	a. Visible leak			a. Lock or side ring	
	b. Fuel tank filler cap missing			b. Wheels and rims	
	c. Fuel tank securely attached			c. Fasteners	
				d. Welds	
	5. LIGHTING DEVICES			12. WINDSHIELD GLAZING	
	All lighting devices and reflectors required by Section 393 shall be operable			Requirements and exceptions as stated pertaining to any crack, discoloration or vision reducing matter (reference 393.60 for exceptions)	
	6. SAFE LOADING			13. WINDSHIELD WIPERS	
	a. Part(s) of vehicle or condition of loading such that the spare tire or any part of the load or dunnage can fall onto the roadway			Any power unit that has an inoperative wiper, or missing or damaged parts that render it ineffective.	
	b. Protection against shifting cargo				

APPLY TO VEHICLE

237-FS-E3 (Rev. 7/97)

LABEL APPLICATION INSTRUCTIONS		Notes
1. Fold ply 1, the mylar film, over the top of stub.	5. Remove the liner from ply 1.	
2. Write firmly to enter data onto plies 2 and 3. Use a permanent ink marker or permanent pencil with an ink image that is fade resistant and will not deteriorate in direct sunlight for the effective annual inspection period.	6. Carefully, beginning at the top, press the clear mylar down over the top of the label until completely covered.	
3. Remove ply 3 at the stub perforation from the set. This copy is for the vehicle file.	7. Properly dispose the label liner.	
4. To apply the label to the vehicle	WHEN PROPERLY INSTALLED, THIS SURFACE PROTECTED, PERMANENT ADHESIVE VINYL LABEL IS WEATHER RESISTANT AND DURABLE FOR REFERENCE BASED ON THE 12 MONTH ANNUAL VEHICLE INSPECTION REQUIREMENT.	
a. provide a clean-grease, dust and dirt free surface.	REMEMBER: USE A PERMANENT IMAGE MARKER OR PENCIL.	
b. remove the liner from the label		
c. apply the label to the clean location

Vehicle Maintenance Pro

Shop Operations

Parts Management

Sourcing Parts

Parts

That expensive brand-new truck, so clean and beautiful on delivery day, begins to deteriorate the day it starts its service life. From then on it's a constant battle to stay one step ahead of the wear-and-tear process. Every Maintenance Pro must plan a strategy for making sure the shop can get a disabled truck back on the road as quickly as possible, and that planning includes parts. We'll briefly look at sources, warranty, and inventory: getting, tracking and stocking parts.

Sources for parts

Aftermarket (selling products/parts/equipment for installation or replacement after the vehicle is purchased) is big business. In the past, the original equipment manufacturers (OEMs) had a lock on the aftermarket parts market. In many cases, the non-OEM parts were viewed as inferior. However, the appearance of better and different products in the aftermarket area (some even viewed as superior to the OEM parts) has changed the climate, making the parts market fairly competitive. Because of this, the truck parts buyer has several sources for parts and services today.

Whether purchasing parts through the OEM or an aftermarket parts dealer, the Maintenance Pro has one important question to answer first. Do you want to insist on new parts, or explore other options?

OEMs still do hold sway over some parts purchasing decisions. If the vehicle is under warranty, the OEM may require that their parts be used to continue the warranty. In some cases the use of a non-OEM part could void the warranty on component or system.

New: The most reliable part is, of course, the brand-new part. It is assembled and packaged by the Original Equipment Manufacturer (OEM) or an aftermarket parts dealer, and it is exactly like its counterpart on a new vehicle. The best reason for buying “new” is the long warranty that is offered and the security of knowing that it should last as long as the original component installed at the factory.

The disadvantages may be the price and availability. All parts for all vehicles of all ages can't be stocked at all OEM and parts dealers. This can lead to vehicle downtime while you wait for parts.

No matter where you deal for new parts, you should get:

- A well-equipped parts center with state-of-the-art testing equipment and trained personnel.

Notes

Vehicle Maintenance Pro

Notes

- A full range of parts services.
- Night and weekend availability.
- An extensive inventory of parts.
- Product support that goes back to the part manufacturer; everyone should stand behind the product from the parts dealer to the manufacturer.
- Seasonal specials, discounts, etc. on a timely basis.
- The willingness to stock parts for you. If you discover that all your water pumps need changed, but you do not have room to stock that many water pumps, will you parts dealer stock them for you?
- A liberal return policy, possibly including an annual “buy-back program” that allows for the return of overstocked items from your inventory (restocking fees are normal in this arrangement).
- Honest communication and responsiveness to your needs, questions, problems.

The fleet that is struggling to meet the higher prices required to purchase parts must remember the labor costs that it takes to temporarily repair a defective part is time that is wasted. This is due to the fact that the labor costs will be duplicated in a short time when a part fails and must be replaced. To sum it up, purchasing new parts helps keep labor costs down.

Used: These are parts that still have service life left in them, possibly after some minor repair or reconditioning. They may be taken from an idle vehicle, from a stock of used parts which are kept on hand for this purpose, or purchased from a used parts dealer. Often the repair or reconditioning can be done in-house to get a vehicle back on the road quickly. Once again, the Maintenance Pro must consider the labor time; a used part is a temporary measure unless the part is completely reconditioned.

A better alternative to a used part might be a “used” vehicle to fill in for emergency service. An older, but well-maintained and still reasonably reliable vehicle (which has been fully depreciated) can perhaps do the job. A spare vehicle’s costs would be primarily licenses, insurance, etc. Its main advantage is the ability to reduce downtime, the scourge of every small fleet. One can also maintain a slim inventory by keeping a spare vehicle on hand because it’s there to take over the run, and you have time to order the parts needed for the disabled unit.

Rebuilt: This booming business entails more than minor repairs. A rebuild job means disassembly, complete cleaning, inspection, replacement of any worn components if necessary, and reassembly. You can do some rebuilding in-house or go outside to specialty rebuilders. The quality of the rebuild depends a great deal on the technician performing the operation and the materials used in the rebuilding. Many fleets have developed a close relationship with rebuild shops for certain components. They have full confidence in the products and are also realizing significant cost savings when comparing the rebuilt parts cost to the cost of new parts.

Shop Operations

Since rebuilding does not involve any component testing, it is more like repair; however, rebuilders don't have access to the manufacturer's specs as a rule. Warranties are available, although they may be a bit on the short side, or strictly limited to purchased parts used to complete the rebuild. Some specialty shops can offer very competitive warranties because of the high-quality work they do.

Remanufactured: A product of an assembly-line process, the remanufactured component is really a combination of new (usually about 15%) and totally reconditioned components (85%). It is tested like a new part to meet the OEM specifications. Design changes that have occurred since original manufacture may also be incorporated into the reman product.

Many OEMs offer reman "exchange programs" where the customer trades in the core component and receives an adjustable trade-in credit, depending on its condition. Exchanging a component before failure saves you money. High-quality remanufacturers:

- Conduct an extensive testing process under realistic operating conditions.
- Offer a warranty written in clear, specific language. Often these warranties are equal to, or even better than, the warranties offered on the corresponding new parts.
- Enjoy a good reputation in the industry.
- Insist on a high-quality finish for the reman component so it also looks as good as new.
- Are often authorized to use OEM company identification or logo.
- Employ a highly trained quality-control staff.
- Have engineering staff that stays current on changes which improve the reman product.
- Maintain membership in a national trade association.
- Have the financial backing to invest in new equipment and attract top-quality people.

No matter where the part was sourced and what type of part it was (new, used, rebuilt, or remanufactured) watch out for cheap imitation parts. This kind of part can run the gamut of legitimacy and quality from doesn't quite fit, to a part that simply fails more quickly, to a part that is downright dangerous.

Key parts terms

We should make some distinctions between all the terms that are currently floating around. "*Genuine replacement parts*" may be packaged under a private label owned by an OEM and handled by an independent distributor. Similarly, *foreign parts* aren't necessarily bogus parts. The medium- and heavy-duty trucking industry operates in a world market today. Many OEMs buy components abroad. Information is your best

Notes

Vehicle Maintenance Pro

Notes

protection here. Check out specifically what the words on the package mean.

“*Will-fit*” parts are supposed to replace a particular manufacturer’s component. In some cases this term has a negative meaning today. While they may indeed do the job, will-fit parts are seen as copies of a product. The manufacturers in this market do not offer any kind of technical support or customer service. Needless to say, they don’t have large research and development departments either. The uninformed customer **thinks** he’s getting an equivalent product at a bargain price.

OEMs would like to see regulations passed to require will-fit manufacturers to meet OEM specs and provide proof of sufficient testing. The OEMs also believe that either the will-fit manufacturer or the distributor who chooses to handle their products should be required to carry product liability insurance. Usually it’s the vehicle manufacturer who is the first to get a claim before it’s discovered that the part in question was manufactured by someone else.

Moving one step beyond “will-fit” is the *look-alike*. The difference is that we are now in the shadow of intentional deception. Even though the look-alike may not at present be judged illegal, it is packaged in a box that is exactly like that of the factory part. Or it may be an identical product in appearance but packaged in a radically different box. A brand name or description may resemble the factory name with some cunning variations. Often the only sign of trouble to an uninformed purchaser is the premature fail date. These manufacturers are depending on the thought that it’s the rare buyer who is suspicious when inspecting parts.

The problem of counterfeit parts

Counterfeit parts are the worst of the cheap imitations. Manufacturers of bogus parts usually choose to copy the high-volume part that moves quickly. Any successful manufacturer is a potential target for the counterfeiter and the practice is widespread throughout the transportation industry: cars, buses, trucks, airplanes, and even NASA equipment for the space shuttle program have been found with counterfeit parts. Counterfeit parts are substandard in quality. A price that’s simply too good to be true may be a clue, however, some brazen counterfeiters charge full price to avoid this suspicion.

The first legislative efforts to protect brand-name labels in the early 1980s did not create much national support on the part of Americans. When the extent of bogus parts-importing and the great dangers to public safety that can result from using inferior parts (safety features were rarely built in) became known, the anti-counterfeiting legislation of 1984 had considerably more support. This legislation dealt primarily with copyright infringement, however, and much more needs to be done.

Remember that it takes a willing buyer to keep counterfeiters in business. If you are a regular customer of your suppliers, they are less likely to cheat you. If you look at more than just the price tag, you’ll protect your fleet from bogus parts and help put the counterfeiters out of business.

Shop Operations

Your best weapon is information. Here are some pointers to keep in mind:

- Deal with suppliers that you trust and know to be reputable. If a supplier is new to you, check it out thoroughly.
- Check on the support services that come along with the products carried by the supplier.
- Ask whether the product meets manufacturer's specifications and has a manufacturer's warranty.
- Ask for customer references and the supplier's product sources.
- The more you standardize, the better you'll get to know the part, packaging, identification system, etc. You and your technicians will know what to watch for — the right amount of filtering material in an air cleaner, for example.
- Don't buy anything on the phone, always examine the part personally, and don't accept anything COD. In fact, 30-day payment terms will give you some time to examine the part and check out how the part is working before you have to pay for it.
- Ask your regular suppliers about new brands from other sources that appear suddenly as a special deal.
- Watch prices, and don't be too quick to switch to a brand-new supplier only on the basis of price. If the prices a new supplier is offering seem too good to be true, they probably are!

It's better to develop some competition between your regular suppliers on price, so deal with several. Get to know them and develop a good working relationship with all of them.

Tracking parts

It's important to know where your parts come from, but you must also track where and when they are used, right to the end of their service life. Recordkeeping on repair orders (ROs) can do this, so try to include the necessary information. Parts yield great information when they lie on the scrap heap also.

Parts/cost tracking

Whenever a part is taken from the parts inventory and used, it must be accounted for. The *cost* of the part must also be assigned to the correct vehicle. If this is not done, studies done to determine the operating cost of a vehicle will not be valid. A Maintenance Pro should be able to open a maintenance file on a vehicle and be able to determine the total cost and cost per mile of maintaining the vehicle. If parts costs are not being correctly assigned to the vehicles, it will be impossible to be accurate.

Also remember to credit back parts costs for warranty reimbursements. If you assign the cost of a part to the vehicle, then a warranty program reimburses some or all of the cost of the new part, there must be an accounting of this or you will not have an accurate maintenance cost for the vehicle. In most cases this will involve going back to the original invoice and work order and adjusting the costs accordingly.

Notes

Vehicle Maintenance Pro

Notes

This includes even small parts such as nuts and bolts. A vehicle requiring an unusual number of nuts and bolts will have additional costs (not only the nuts and bolts, but the manhours to install the nuts and bolts) and may be having problems.

One concept that is in use is “bundling” parts into kits for normal maintenance or repairs. This makes requesting and tracking parts easier for the technician doing the repairs, and places the recordkeeping back onto the parts personnel. Here is an example of assigning a part number to the parts needed to complete a normal PM B (remember, this is just an example, you will need to determine your own parts requirements for a PM B):

Part number 1234567 includes:

- 2 — Main oil filters part number 23456
- 1 — Auxiliary oil filter part number 24680
- 1 — Fuel filter part number 34546
- 8 gallons 15w-40 oil
- 1 quart 5th wheel lubricant

The technician or parts personnel would record the one overall part number on the RO or service checklist when doing the PM, and parts personnel would record the actual parts used later. If the technician needs additional parts (antifreeze, slack adjuster, tire, light bulb, air filter, etc.) the extra parts are recorded on the RO or service checklist.

Who records the parts when they are used?

One internal function you will need to iron out is who will track parts as they are removed from parts storage. There are several different ways this can be accomplished. Here are the most common:

- Designate one technician to be the parts manager. Anyone taking parts out of the parts inventory would need to notify this individual. This individual would then be responsible for documenting the use of the part on the appropriate paperwork (RO, checklist, or parts use ticket). Part of this technician’s responsibilities would also include doing an inventory and ordering parts as necessary. This is used in carriers that are too small to designate a dedicated parts manager.
- Each technician can be made responsible for recording the parts used on the RO, checklist, or parts use ticket. Whoever is responsible for parts (parts person, parts manager, or a specified technician) would then need to review the ROs, checklists, and parts use tickets (and possibly do computer entry) to track the parts inventory and assign parts to the correct vehicles.
- Designate a dedicated parts person or parts manager. In small to medium sized operations this individual could be assigned all parts responsibilities including documenting parts use, warranty verification and claim filing, parts failure analysis, and reordering.

Shop Operations

Failure analysis

All maintenance people recognize that parts do eventually wear out. And if you've been tracking the cost per mile and service life of components, you'll have a pretty good idea of when it's time to finally stop repairing and just replace. You'll keep testing different manufacturers' components to see how they compare with your life-cycle standards. But instead of just tossing aside the part, try to sharpen everybody's observations by asking why the part failed? What kind of wear was observed? Technicians should be trained to tell whether parts are worn by normal wear and tear or abnormal conditions.

Parts should never be thrown away without looking them over. Some fleets store failed parts in a specific location, and trained supervisors and technicians then look through the parts at least once a month. Drive axle failures, for example, need to be analyzed to see if the component failed because of shock, fatigue, overloading, or improper lubrication. Parts that have been repaired in the shop are always checked over. You need to know whether any part failure was a result of:

- Poor PM procedures or inspections that were too infrequent.
- The design of the part.
- Improper use of the part.
- Driver abuse.

Recordkeeping on components, particularly if it's computerized, can track which brands have the longest life, the fewest technician hours, and the best overall cpm. You need to know why they failed, how they failed, how many hours/miles were on the parts, not just when they failed.

Warranty program

A warranty is a guarantee by the manufacturer that you will be reimbursed for early failures resulting from a poor manufacturing process or some fault. To collect on a manufacturer warranty you must have accurate records, starting with hard data that is consistently gathered and maintained.

Naturally you look at vehicle and product warranties before purchase. Any vehicle or parts warranties should be set forth in writing and in detail before purchase. You should ask:

- What exactly is covered, all parts and labor?
- Who is authorized to grant warranty claims (dealer, supplier, manufacturer, etc.) and what is the filing procedure (online, in-person)?
- What is required to substantiate a claim?
- Are any related costs covered?
- When are claims settled (once filed, 30 days)?
- Is there a grace period?

Notes

Vehicle Maintenance Pro

Notes

- Is there a choice of cash or credit once the warranty claim is determined to be valid?
- May any shop (including your own) perform the warranty work or only an authorized dealer shop?
- What is required to get (and keep) your shop authorized as a warranty shop?

New vehicle warranties are the easiest to track. New vehicles come with a warranty package. Simply keep track of the component warranties and compare them to the vehicle mileage or hours whenever a component fails.

Where warranty tracking becomes difficult is when trying to track warranties on replacement parts. Many carriers lose money regularly by tossing damaged parts that were still under warranty.

To avoid this, carriers have developed various strategies. All of these strategies depend on knowing (and recording) the parts warranty, tracking the date and mileage or hours of the installation of the part, and entering the information in the vehicle records (whether paper or computerized). Here are a few of the strategies that are in use to try to catch the fact that a warranted part has failed:

- Whenever a part is removed it is tagged with the vehicle number and mileage or hours. It is then placed in the failure analysis area. As part of the failure analysis an assigned individual does a records search and determines when the part was installed and if there is still any warranty that may apply.
- The addition of a warranty module to the maintenance computer system that warns the technician or supervisor whenever a warranty part is being removed.
- Placing warranty dates on vehicle components so that they can't be overlooked by technicians.
- The designation of a warranty supervisor who is assigned the responsibility of establishing and supervising a custom warranty program.

While computerized records are ideal because they can be accessed faster and can be programmed to remind you when a component carrying a warranty is being serviced, any records system can help you recover more claims. In most cases you must remove, retain, and tag components to demonstrate your claims to the manufacturer or supplier.

Finally, you must remain alert for changes in manufacturers' warranty policies so that you'll be able to purchase intelligently in the future. Submit every claim that you think you're entitled to (even if you are not sure you qualify). Don't say you're too busy to be bothered. You can't afford that attitude. Keep track, too, of all warranty claims, payments, settlements, and denials in a separate book, and review these periodically.

Shop Operations

Stocking parts: The inventory

If it didn't cost so much, all fleet shops would have a big parts department so the right part would always be in stock. Inventory can be a sizeable investment; first of all, the parts themselves, then storage costs, insurance and property taxes, and the cost of obsolescence if the part isn't used. So it's evident that better inventory control can save the fleet some money.

All fleet shops must have some parts on hand for a single, important reason: to reduce vehicle downtime. And that's the only reason for stocking parts. You need them to be available immediately for use when they're needed for service or repair. So you must balance the cost of carrying the item in stock against the certainty of its availability.

All inventory systems must decide:

- What to stock.
- How many to stock.
- When to order more stock.

What to stock — A simple thought process should go into this decision. You will need to study parts use over a specific period. What you are looking for are parts that move quickly off the shelves and parts that left vehicles sitting. If vehicles were sitting waiting for parts, examine what parts were involved and how often this happened. It may be beneficial to stock one or two of the parts, even if they are expensive, to avoid downtime.

How many to stock — This is also an area that simply requires some study. Keep track of the volume used to determine what the parts inventory should be. The window that many experts use is 30 days. At any given time you should never have more than a 30-day supply of any part, no matter how frequently it is used. If it sits on the shelf for over 30 days you are in a situation where you have paid for a part you are not using.

The only variable that may change this is bulk discounting or bulk buying to avoid a known price increase. If buying larger quantities of a part will reduce costs, it may be worth the purchase (however, remember to consider your cost of paying for and then carrying the parts on your shelves). However, bulk buying seldom-used parts can never be a winning proposition (extended carrying times/costs and the possibility of obsolescence). This applies even if your parts dealer offers an annual overstock buy-back. This program can help reduce the impact of overstocking, but the parts dealer will charge a restocking fee.

To assist in managing this, some carriers date incoming parts. This can be done using a manual system or dating the part in the computerized inventory and setting a flag to pop up for parts that have been shelved for too long. The ordering situation around any parts that stay on the shelf for more than 30 days is then investigated.

When to order more stock — When to reorder is closely tied to how many to stock. The frequency of the use of the part will determine this. If the part is one that moves slowly (one or two per month) you may be

Notes

Vehicle Maintenance Pro

Notes

able to reorder when the last one is used. Parts that move through the parts department in a hurry may require reordering while there are still several on the shelf.

One industry expert believes that most fleet shop inventories are too high and that in terms of dollar amounts, about a month's turnover should be on hand at any one time. This amount would vary with the amount of work performed by the shop or if the parts supplier were close by. We have already mentioned that standardization of equipment would also require a lower level of parts inventory.

You can also look to your supplier. Many truck manufacturers and parts dealers offer extra services to attract and keep customers, such as assistance with inventory control. Inventory stock can be reduced by having close communication with a well-stocked supplier that ships just-in-time (JIT). This is an ideal situation, but success depends on a guaranteed delivery time if the supplier is some distance away.

The other consideration is how well-stocked your local suppliers are, and their delivery speed and your ability to send someone for parts. It may not be necessary to stock seldom-used parts if your local suppliers are well stocked on the part. Also, if your parts dealers are willing to stock for you, especially in the case of additional needs (having to replace all of the water pumps in the fleet), you have less need to stock the parts on your shelves.

What to stock, how many of the items to stock, and when to reorder requires forecasting what the future needs. This requires studying previous use patterns and trying to forecast future use. If all things remain constant, past performance should be a reliable indicator of future requirements. However, if the fleet is allowed to age or is turned over at an accelerated rate, adjustments may be needed.

An important task of any parts control system is reducing inventory by getting rid of obsolete items and parts that are overstocked to the point that you will never use all of them. It is important that the parts inventory system helps to identify these white elephants. Once identified they need to be moved on. Possible solutions include selling them back to the supplier (either as an independent item or as part of an annual buy-back program) or selling them outright. Either way, get rid of these white elephants and get at least some of your money back before you are stuck with them permanently.

Inventory control

Manual control

While many fleets have computerized their parts control, a manual system can be just as efficient if the system is organized and the parts people are trained. Most manual systems are based on organization by bins, or parts boxes stacked on shelves. Each bin lists the part number, price, and minimum and maximum quantities permitted. Designating a fleet part number classifies identical parts which could have different manufacturers' numbers. And of course the parts room is organized with heavier things on the floor; small, high-volume items in the front, etc.

Shop Operations

Regular physical inventories conducted by the parts people must be made so the inventory can be kept stocked and parts don't walk away.

One small fleet that has plenty of storage space and an organized technician in charge, has lots of extra salvaged and rebuilt parts to back up the regular parts department. When there are no vehicles in for service, the technicians clean, check, and rebuild the parts that were removed from vehicles.

A manual system would also need some kind of master record of what's in stock. As parts come in they could be logged on a master parts card (identified and indexed by part name and number) together with quantity and price. Parts are charged out on the technician's RO; when the repair is over, the parts are deleted from the master card inventory. It's detailed work and time-consuming, but that's a necessary part of control.

An accounting system can then be developed that pulls parts use off ROs, adds in restocks, and generates a parts count. This is then compared to the parts inventory as determined by the parts cards.

Finally, if you're located in a state with high taxes that consider property or stock on hand, you'll want to deliberately reduce the inventory at fiscal year-end. This way the inventory will be reduced when the assets of the company are calculated. Once the tax inventory is completed you can slowly build the inventory back up to a more comfortable level.

Computer control

A computerized inventory system keeps track of parts automatically and effortlessly. Some software systems can print out a list of needed parts when the number of items gets down to a predetermined level. These systems will assign company control numbers, keep track of bin locations, and even print bin labels.

The system can use manual entry, bar code reading, RFID chips, or a combination of all of these (RFID on large items, bar code and/or manual entry for smaller items) to track items entering and leaving the inventory. Once established, the inventory system can have flags installed at predetermined inventory levels. If too many or too few parts are on hand, based on the control numbers, the system will notify someone.

These systems can also make cost tracking easier. The actual cost of the part at time of purchase can be tracked and stored in the system. Once the part is removed from storage and placed on a vehicle, the vehicle can be charged the actual value of the part. Manual systems can have trouble with this if the part has been in the inventory for any length of time. Also, if there is a warranty reimbursement later, this can simply be updated in the computer system. Manual systems may require retrieving and updating two or three paper records to accurately reflect the reimbursement.

Large fleets with several terminals may have a central parts warehouse to serve them. The computer can carry the total inventory, displaying on the screen the parts availability of any item. Almost any kind of report can be generated: shipping lists to a single terminal, quantities adjustment, inventory on hand by terminal, etc.

Notes

Vehicle Maintenance Pro

Notes

How often to order is the final inventory decision; it should be based on past demands, not simply replacing parts used. Establish a lead time — the time between arrival of a new order until the reorder point is reached — for parts so that the ordering process can run smoothly. Good service from a supplier can help. A fast telephone ordering arrangement with vendors can be useful if storage limitations force the shop to stock fewer parts. But established lead times can help you get better prices and fewer emergency situations.

Vehicle Maintenance Pro

Shop Operations

Recordkeeping

Notes

Maintenance and repair recordkeeping

There are two reasons to maintain records of all maintenance and repairs.

One is operational in nature. By saving data on all maintenance and repairs, you will have an accurate database to mine (refer to as datamining) when decisions need to be made on everything from equipment replacement to employee award programs.

The second reason is compliance with the Department of Transportation regulations, as published and enforced by the Federal Motor Carrier Safety Administration. The FMCSA regulatory recordkeeping requirements will be discussed later in the Compliance Management section. However, if a carrier is using a complete and effective recordkeeping system for operational purposes, it should meet or exceed the FMCSA requirements.

One key point about recordkeeping: As far as your internal tracking and the FMCSA are concerned, if you didn't document it, it didn't happen. This lack of documentation can create several problems. First, you will not have records to make sound decisions in the future. Second, you may end up fined for not complying with the regulations, even though the only regulations you are not complying with are the recordkeeping requirements. The documentation that shows what was done in the shop is the repair order, or RO.

There is also one other compliance issue to consider, whistleblowers. Any employee (technician, driver, dispatcher, etc.) has the right to complain to either the DOT or OSHA about unsafe conditions that the company has refused to address. When it comes to complaints about unsafe equipment, if a driver is able to show safety concerns were brought to you (such as the driver turned in a DVIR listing safety-related defects) and it is determined that you failed to act on them (due to a lack of documentation), you could be in serious trouble.

An example would be a driver complaining about the truck constantly "pulling" to the right. If a technician checked the tires, suspension, and alignment, and took the truck on a check-ride, but did not complete an RO for the inspection because he "really didn't do anything," you have no proof that the complaint was addressed. The proof that you addressed the driver's safety concerns in such cases should be on the associated ROs.

Aside note on whistleblowers. If you determine who the whistleblower is, you cannot take adverse action against him or her due to the complaint. To do so can trigger serious consequences for the company, and potentially the supervisors and managers involved.

To sum this up, a good RO and RO system (some carriers and shops refer to this documentation as a "work order") provides a detailed and accessible history of the vehicles and all work done to them.

Vehicle Maintenance Pro

Notes

Simple, handwritten ROs

In a small shop the repair order is the primary piece of paperwork because it:

- Communicates to the technician exactly what has to be done (in some cases it may even be generated by the driver).
- Authorizes personnel to order the necessary parts or withdraw the parts from the inventory.
- Acts as a purchase order for parts and services outside the shop, i.e. tires and batteries or an alternator rebuild.
- Provides a record of work performed by technicians.
- Provides a record of work performed on the vehicle.

Basic information. You expect the RO to identify the vehicle, the date, mileage at the time of repair, the reason for repair, the parts used, who performed the repair, and the cost. This information is called historical data; it is simply a collection of maintenance facts.

RO forms vary in complexity. The number of people who handle the RO is small in a little shop, but as the shop grows, the maintenance department may need a repair order with more detail. In the first repair order example (small shop) the “instructions” section of the RO is meant to be completed in writing by the person issuing the RO and read by the technician, supervisor of an outside shop, etc. It’s possible, though, for the reader to misunderstand the orders if they aren’t written clearly. There may not be too many choices for reason for repair (“Other” can invite a variety of definitions for the same thing).

Another problem with this type of RO is the maintenance pro has to go through lots of lines of handwritten material to figure out what’s going on in the shop!

To get a clear picture of your operation, you should be able to take the ROs for a single unit from the past year or so, and make some conclusions about your maintenance plan. Try not only to look at maintenance facts or historical data, but how the information categories can help you spot potential problems.

The RO should be a treasure chest of facts, but they are of little use until you put them to work.

Shop Operations

[illegible]

FORM NO. 125-FS-C3 Rev. 3/95

Historical data — This section (top right) of the RO identifies the company and the unit, and tracks its mileage or hours (“odometer,” hubometer, or hour meter, or just “meter” reading might be a better word choice!) through its service life. Mileage/hours can be checked, too, against fuel tickets, driver’s logs, or dispatch records, etc. The meter’s reading:

- Is the basis for a PM schedule.
- Pinpoints the time when any component failed.
- Shows vehicle utilization (when you compare it with other units in its group).

Notes

ORIGINAL

Vehicle Maintenance Pro

Notes

- Shows downtime problems (when you compare it with other units in its group).

Breakdown category on the RO — This RO area is extremely important to your operation. It doesn't take long to discover if you have a problem with breakdowns — but how many are too many? One of the maintenance shop's primary goals is to have no breakdowns at all. So this "reason for repair" will be the first one to act upon and try to reduce frequency.

How is it done? PM, of course. That's the primary purpose of PM in a nutshell — to cut out breakdowns and reduce costs of downtime. If you are seeing "Breakdown" checked a lot and a variety of components listed, you should review your general PM practices. If a combination of "Breakdown" and certain component repairs seems always to be on the ROs, this tells you something else. Earlier replacement of this component will need to be done on existing vehicles during PMs, and a more robust component should be looked at on new vehicles.

Driver's Report category on the RO — The Driver's Report category has much food for thought. First take a look at the driver:

- Do some drivers complain more than others?
- Are the drivers knowledgeable on the equipment they are operating?
- Does one vehicle get more driver complaints?
- Are drivers kept informed about the results of their complaints?
- Is there good paper communication (the driver inspection report) between driver and shop?
- Are maintenance inspections finding problems that the drivers are not reporting?
- Does fleet management need to look at a better method for screening, training, or testing drivers?

Inspection category on the RO — How do you define the Inspection category? Is the entire vehicle inspected at one time? Is this different from scheduled PM inspections? Be sure that the person completing the RO knows whether a diagnostic check of the vehicle falls into this category.

PM category on the RO — The temptation in the PM category is to combine the work with other procedures. The truck is brought in for a driver complaint, so let's do the PM too. Another situation that arises frequently is while the technician is doing a PM, a major problem requiring repair is discovered (unrelated to the PM). Some operations will include this work in the PM category. But combining information like this throws off the RO. Only one box should be checked in the reason-for-repair section. Use another RO for the second procedure.

"Other" leaves too much room for interpretation if it's not given some conditions! If you use a simplified RO, let the preparer know exactly what the choices are.

Shop Operations

The parts section in this simple RO again requires that you read and work through word descriptions when you try to get a feeling for which components need work most often. Have you standardized these identifications? You can keep an eye on prices and perhaps select a more competitive supplier by watching the ROs.

Now may be a good time to think about parts-flow to technicians. Could you put in a better system? Do your technicians check out their own parts? How could that system be streamlined? Would you like to improve your inventory system? Some things are missing from this simple form if you want to improve your parts control.

Note, too, that there are no provisions on this RO for analysis of failed parts unless it is included in the technician's repair description. Do you keep failed parts? Do you discuss them with technicians? Do you want to capture the reason a part was replaced or repaired for later analysis? If so, you will need to add some additional information onto this RO.

This RO doesn't help with warranty claims either. No separate identification box is set aside for this important category. Warranty recovery and failed-parts analysis are two areas sometimes neglected by smaller fleets whose people simply don't have the time to follow-up. Do you fall into this group?

Task and time recording — Tasks and time as recorded by technicians are the major items of interest if you are trying to make the shop more efficient. If the technicians do not get specific instructions in this area, there can be problems later.

There are provisions on this RO for logging in and out of the task, so by looking at this portion of the ROs, you can compare time spent on the same task by two technicians. However, it is important the technicians correctly record their work for this type of RO to work. If the technician records only a PM, but in the course of performing the PM repairs several defects, it can create problems. If the technician does not record the repair work correctly, then it appears the technician was slow when performing the PM.

To address these situations you will need to answer a few questions. How good are your technicians' work descriptions? Have you standardized terminology? Does your RO have a place for a technician's comments beyond the "work accomplished" description? Are you able to track a technician's non-work time on the job (such as waiting for parts)? Are all the people who handle the vehicle during the service process represented on the RO? Washers, chasers, helpers, and fuelers need to be included. And finally, do you have a way to estimate repair time and then compare it to actual time?

Also, is there a way to indicate if the repair is "rework"? Rework involves having to repair something that was already repaired once. In the case of rework you not only want to know it is rework, but why the rework was necessary (part failure or technician error) and who did the original work. This simple RO does not have any way of recording this (other than the technician's hand-written notes).

Notes

Vehicle Maintenance Pro

Notes

Another issue you need to be able to track is time spent by technicians on “direct” and “indirect” work. Direct work is time spent repairing, maintaining, inspecting, or otherwise working on vehicles. Indirect time is time spent doing other required tasks, such as set-up, waiting for parts or assistance, waiting for a scheduled vehicle to appear, travel time to a disabled vehicle or to pick up parts, cleaning up after a job, training, etc. It is time that is necessary for the technician to do his/her job correctly, but it is not time spent directly doing their actual job.

A simple view of indirect time can be created by comparing time “punched in” to the times on ROs. If the technician had eight hours on the clock for the shift, but only had six hours of time on ROs that day, then the technician had 2 hours of indirect time. The trick is having enough data to determine if the indirect time was time well spent, or if it was unproductive time that was either unnecessary time on the clock or indirect time that could have been prevented (such as running to a parts store for parts for or waiting for parts to be delivered). Some shops, in an attempt to capture more realistic data when it comes to direct and indirect time instruct their technicians to make sure to detail out set up, clean up, waiting time, and other indirect issues on the correct RO, and then these hours are pulled off of the ROs and recorded separately. Other indirect time (such as training time, bench rebuild time for a part not assigned to a specific vehicle or job, and time spent waiting for another assignment) is then captured using another mechanism.

Just an FYI: A standard goal in the industry is to see a direct/indirect ratio of 85/15 (85 percent of the technician’s time should be direct time). If you cannot achieve this, then it is generally accepted that process improvements are needed to get the technicians away from spending time on unnecessary tasks.

Yearly totals will help decisionmaking —Tracking the repair hours per vehicle over the past year gives you an idea of how many technician hours are needed to maintain the fleet. This information in turn helps determine how large a staff of technicians is needed. Do you suspect that your crew is overstaffed? Are there too many crisis situations involving overtime, followed by “slow” periods?

Determining man-hours necessary and scheduling maintenance will help even out the workload and keep the staff “lean.” Working with the dispatch group to spread out the workload can help avoid this “overload”/“no load” work situation in the maintenance shop.

Vendor area on the RO —In many cases you may be using outside vendor services. These are most commonly used to provide extra capacity to the shop (overflow), provide long-term repair capabilities (engine rebuilds, etc.), and provide service and repairs to vehicles that are not housed at the home facility. Of course another reason for using vendor repair is an on-the-road breakdown (not a preferred situation).

This short list of questions may trigger actions that may apply to your situation when it comes to vendors:

- What are the reasons for buying outside maintenance?
- Are minor repairs done off-site because of breakdown emergencies?

Shop Operations

- Are they done outside because your own technicians are tied up?
- Are repairs being done by a vendor because of a lack of qualified technicians to perform specialized repairs?
- How many hours is it taking vendors to complete maintenance tasks and how long are vehicles kept waiting for service at vendor locations?
- Will doing more work in-house reduce downtime?
- Will doing different kinds of work in-house pay off?
- Can you increase efficiency in-house to accommodate more work?
- Will the use of a vendor shop reduce downtime?
- Will using a vendor shop for either very short or very long maintenance tasks improve shop turnaround times?

Whatever the reason the outside vendor was used, the work performed by the vendor should be RO'd into the company system, and the RO should clearly indicate that the work was performed by an outside vendor.

Do you need a more detailed RO? You should give some thought to whether your shop's RO is sufficiently detailed. In a small operation people can operate by word of mouth and things usually get done! But when data is needed for decisions, the need to get information from the past ROs becomes important no matter how small the company. Try remembering how many times repairs classified as "breakdown" were performed on a vehicle over the last four years!

As the maintenance pro, you may not have the time to draw conclusions from handwritten comments on the simple ROs. If this is the case you'll want a more complex RO, one that can be completed quickly. Check-off items rather than instruction/description lines standardize information. A series of check-off codes means that even more information can be itemized on the RO.

VMRS ROs

The American Trucking Association's Vehicle Maintenance Reporting Standards (VMRS) is a coding system that is used throughout the world as an industry standard. The VMRS has been developed over a period of time to cover every aspect of the maintenance operation, from assigning component codes down to individual parts to failure codes like "bent, foreign material present, not drilled, poor metal finish," etc. And you probably already know that by standardizing reasons, causes, and actions into codes, these maintenance facts can be entered into the computer for easier processing.

The RO is the most important source document for a computerized maintenance system. The second RO example uses VMRS codes. However, it would work equally well whether your maintenance operations were computerized or not.

In many cases the VMRS ROs only require the technician to check a box. The checkmark then identifies the coding. In other areas the technician simply writes in the two letter code that matches what was performed, or found. Wherever the RO form does not provide a check box (such as where

Notes

Notes

[illegible]

FORM #137-ES-C3 (Rev. 4/94)

More advanced VMRS RO systems will incorporate more data in the same structure. As well as asking the technician to provide a reason for the repair and parts used, the VMRS can also ask for the specific reason a part failed and had to be replaced. All told, VMRS includes over 80 “code keys.” Each code key captures specific data pertaining to the vehicle and the maintenance or repair performed on it. The code keys are “strung” together to create a sentence explaining who, what, when, where, and why to each and every repair or service.

Shop Operations

Many OEMs are now accepting VMRS downloads into their online warranty systems, making claims filing considerable easier. If the carrier codes the repair once using the VMRS, the OEM may not require recoding to match their system.

This is one of the drawbacks to using any handwritten system. Many OEMs require coding of repairs, meaning the written repair order will need to be changed over to the VMRS coded system before any warranty claim can be filed.

Analyzing Data

Analytical data—There is a minimum set of data we want to collect and use. We want to be able to identify the vehicle, be able to determine what happened to it, what was done to correct it, by which person, where, and at what cost. These maintenance facts then can lead to analysis. To accomplish this the ROs must:

- Capture the correct data.
- Capture the data at the earliest possible moment.
- Be free of errors and omissions.
- Be quality checked for accuracy.

The analysis that follows must:

- Make comparisons that are meaningful to you.
- Put the comparisons in a report format that is easy to understand.

For example, consider a simple monthly report that lists each fleet vehicle that includes the following information:

- Total mileage on the vehicle.
- Mileage run in the past month.
- Fuel consumed during that month.
- Average miles-per-gallon for each vehicle.
- Oil consumed for each vehicle during that month.
- Miles-per-quart or miles-per-gallon engine oil consumption.
- Maintenance cost for each vehicle.
- Maintenance cost per mile for each vehicle.

This would be an uncomplicated report that is easily read. You don't have to be an expert to look at the numbers and figure out that one truck had a real fuel-economy or oil-consumption problem. Good maintenance reports are only possible if you choose the items of information that you need and create a recordkeeping system that makes sure the correct data is captured and nothing gets lost.

But the fleet can't afford a computer system to keep track of all this, you say. Even with a manual system, i.e., preparing the RO by hand, you should standardize the information as much as possible (even consider using numeric codes rather than long hand-written explanations). This

Notes

Vehicle Maintenance Pro

Notes

will shorten the RO completion time and organize your recordkeeping. Also, having RO standards in place will make manually compiling data faster and easier. Finally, should the fleet decide to computerize or switch to the VMRS system, you'll be prepared with data that is already standardized.

A word of warning. It's as easy to get too many stacks of paper that you cannot analyze as it was to lose control of the ROs in the first place. That's why it's a good idea to start slow when compiling reports and analyzing data. Remember that reports should:

- Be easy to generate with existing data.
- Give a picture of a vehicle's health by providing up-to-the-minute cost and repair information from the records.
- Identify high-cost maintenance areas.
- Spot and correct trends.
- Point out problem vehicles, components, and personnel.

These days you can get very sophisticated computer systems which include all kinds of very useful management data, or you can start slower and upgrade your system as you go along.

Reports can also remind you of upcoming PM requirements. One report that many carriers run daily is a report that identifies vehicles that are coming due for PM. Also, reports can be used to track the vehicles that have or have not had specific work performed (such as recall work or upgrades).

More advanced reports can be summaries or comparisons of the fleet's historical data. Reports can compile a list of RO items according to vehicle, driver, PM schedule, technician, or vehicle make. Analytical reports compare the compiled data, i.e. vehicle downtime hours versus maintenance hours or elapsed miles since the last PM versus elapsed miles since the last repair situation.

Computerization is money well-spent when it comes to developing and using analytical reports. Computers make storing and moving numbers around fast and easy. You can spend lots of time comparing this to that in a matter of seconds. But is it useful?

Computer salespeople are fond of showing you reams of printouts from a huge variety of reports to make a sale. The question to ask is how useful are the results of the analysis? Or, phrased another way, is there action that can be taken based on what is found in the report? If not, the report is of little value.

One key point — computerized shops do not have problems generating reports on components if the data is entered correctly. If the system is not using a standard reporting system (such as VMRS), the computer is of little use. Vague entries in a computer system create the same problems as vague entries in a paper-based system.

Tracking ROs to extend component life should be one of the goals of any datamining. Do you recall how life-cycle studies were used to determine

Shop Operations

maintenance cycles? If components are carefully tracked, a maintenance pro can better decide when to trade based on what projected costs are likely to be and what components to consider upgrading on the next generation of vehicles.

Manufacturers routinely use computer programs to compare old-vehicle costs and new-vehicle costs to help the fleet personnel in purchasing decisions. There is no reason the maintenance pro cannot use the data generated through the ROs to make the same decisions internally.

Components have a service life and can be tracked if you have all the necessary information. Costs per component can be monitored, and a cpm per component can be calculated. When spec'ing major components, a manager needs to know more than the purchase price. He wants to know what the future maintenance costs of those components across the service life are likely to be.

This is applying life-cycle costing to the component. Just like a vehicle, components costs include:

- purchase price,
- repair frequency and costs,
- PM costs,
- replacement costs, and
- loss of revenue from vehicle downtime.

These are all figured into the cpm by adding them up and dividing by the mileage at the time of replacement. By pulling information from ROs, the cpm of one component in your fleet can be compared to that of another make.

The bottom line is that the fleet needs maximum life from components as well as from vehicles.

RO tracking and reports from the information collected is your ace in the hole. One key point — you have a greater stake in repair-tracking than cost-tracking. Think of it this way, wouldn't you like to catch component failure before it happens than be able to clearly define what the failure cost?

Can road failures ever be eliminated completely? In the not-too-distant future, you'll be able to spec components hooked into electronic sensors that will signal imminent failure. But until the red light or buzzer is installed in the truck — and at a reasonable price — you'll have to rely on the observant eyes and trained ears of fleet personnel and reports from the maintenance records.

Expected component life system (ECLS), which was discussed in the Determining Maintenance Schedules chapter, is one critical output of the recordkeeping system. Simply stated, ECLS means changing the part before it fails. The information needed to implement ECLS is in the ROs and the reports that can be generated. One fact that can be assessed from the ROs is the mean time between failure (MTBF). MTBF studies are performed by mining the data provided by ROs (or the computerized

Notes

Vehicle Maintenance Pro

Notes

maintenance records). As discussed earlier, MTBF is the average time and/or mileage that a part is known to fail at. Determining the MTBF is a fairly simple exercise if you have the records (ROs or computer records).

Begin by locating and logging the past repairs of a group of like-vehicles. Be sure to log the length of time the component was in service and the mileage at time of repair or replacement. From this simple data set you can determine the MTBF. If your records are computerized, it can be even easier. Simply ask for the report.

You won't see immediate results with ECLS — patience must be your strong point. Initially, maintenance pros trying to implement the idea have met resistance from management and members of their own staff. It requires accurate data, time to track and analyze the data, and a commitment to acting on the information discovered. Today, thanks to positive fleet experiences with PM and ECLS, changing components before failure has become accepted practice.

The more detailed the records, the better. It is important that the data be available to mine. If, when the ROs were completed, the technicians were not recording either historical data or components and systems being repaired or replaced, the MTBF cannot be determined accurately. This is where having standards in place and using a system such as VMRS becomes critical. The data must be there, and be in a usable format.

As you go through the ROs, zero in on the “instructions/work accomplished” and language. Can you tell exactly what happened to the component, based on what is written there? Was the component changed due to mileage, wear, damage, or a driver complaint? When it was removed, what condition was it in? If the shop has been using a simpler form that requires written rather than check-off or coded responses, insist that the entries be concise. A vague “won't run” or “changed” is no help. Why it wouldn't run and why it was changed are important details!

Using truck system, assembly and part identification codes, failure codes, and reason for repair codes on the RO speeds up the search and also paves the way for changing over to a computer or VMRS system.

The data can provide guidance on everything from when to replace components in the PM program, to when vehicles should be replaced.

Even if your vehicles go out-of-house for some work, you need to monitor those ROs in just the way we have described — both costs and repairs! Demand good work from your vendors. Compare vendors and change if necessary. Insist that they operate according to the standard that you have set up.

Shop Operations

Putting the data to work

Here is a case study in putting all the data available into use to determine when components should be replaced based on the records kept at a carrier.

Begin with these steps:

- Go through your ROs and write down the mileages at the point where all key components failed.
- Average the total for all vehicles in your fleet; this brings you to a MTBF for your fleet on the components you are studying.
- If you already have a standard in place, how is the fleet performance comparing to the standard for the component? Are you having failures of the component before the standard calls for changing it?
- If no standard exists for the component, choose a mileage under the MTBF at which your fleet will replacement the component.

You should always group like-vehicles in your own fleet when making this kind of comparison. By doing this, you develop more accurate analysis, and you will be able to compare the different manufacturers or generations of vehicles.

Here is an example of why you need to group vehicles rather than studying the fleet as a whole. While going through the analysis you notice that a specific make and model of engine is requiring a rebuild at considerably less mileage than other makes or models. If you had grouped all the vehicles together your MTBF for engines would have been lower as a fleet. You may have “thought” you were doing more rebuilds on those engines, but you would not have been able to prove it. By having accurate data and separating the data correctly for analysis, you know you have a problem.

After grouping vehicles, and tracking and analyzing the data, you determined on average that:

- Alignments are being done at 100,000 miles.
- Engine tuneups are being done at 100,000 miles.
- Alternators are being replaced at 200,000 miles.
- Fan clutches are being replaced at 150,000 miles.
- Turbo chargers are being replaced at 250,000 miles.
- Water pumps are being replaced at 160,000 miles.
- Engine rod and main bearings are being replaced at 250,000 miles.
- Air compressors are being replaced at 250,000 miles.
- Fuel pumps are being replaced at 300,000 miles.
- Rear axles and transmissions are being rebuilt at 550,000 miles.

Again, if you are using a computerized system and/or a VMRS-like system, the task will be much easier.

Notes

Vehicle Maintenance Pro

Notes

The next fact you need to determine is: how does this line up with your maintenance schedule? Are the components being replaced or rebuilt on schedule as part of the PM program, or are they being replaced as the result of a failure? Worse yet, how many had to be replaced on the road?

If you have never had a particular component fail (every time the component was changed it was in good condition and only changed due to the PM interval), you could try extending the mileage. If there are too many failures, decrease it. Remember that if a truck's operating environment changes, you need to look at the standard again. Similarly, if a component design changes, a heavier-duty component becomes available, you may try extending the interval.

When the standard mileage interval comes around, you can decide action at that time. If something else needs to be done on the truck, fine. Bring it in. If an inspection, etc. is coming up next trip, you can delay the component change, because there are some "maneuvering" miles built in.

The point is that you decide, you control, using the data provided from your ROs.

The Computer and the Shop

Throughout this section of the manual we have made references to standardizing and simplifying your maintenance records so that they will be ready for processing. The computer excels at keeping track of facts and figures, and making long and tedious manual calculations quickly and easily. It is also good at doing repetitious tasks. And a computerized system is the best way to store extensive records in an organized fashion. It will work with the same data in different ways; for example, we have seen how the information on one RO can be used to track a problem component or check the reason for an unscheduled shop visit.

Up until recently, computerization was beyond the reach of the small fleet maintenance shop because of the great expense required to set up and operate a system. However, the personal computer has put computer capability within the budget of most fleet operations. Besides being relatively inexpensive, personal computers are easy to run and are quickly installed. Even if the fleet expands suddenly and decides to computerize on a larger scale, many personal computers are capable of being part of network systems. It's therefore possible to have a personal computer in the shop which is connected to the larger fleet system.

If you have a manual system that is operating smoothly, but you wish to investigate computerization, take some time to check out magazines and buying guides. Trucking and association magazines regularly have features on computer software (the program that runs on the computer) specially designed for the transportation industry. You will naturally be interested specifically in maintenance programs or maintenance modules that are part of a larger truck fleet package.

If other computerized fleet shops have operations similar to yours, check out how well the computer is serving their needs.

The first software package intended for personal computers and designed for vehicle maintenance (from 5 to 600 units), was HERCULES,

Shop Operations

developed by a company called Computer Task Group. The program ran on Apple and IBM personal computers. Today maintenance programs for personal computers are being developed constantly. They range from simple tracking systems to very complex and detailed software systems mostly suited for larger fleets. The price of the software will generally dictate the level of user.

Another alternative is “*Keller’s Maintenance Manager*.” This is a versatile software program that can help you meet annual vehicle inspection requirements, track maintenance and repairs, plus establish a cost-control program. The software enables you to efficiently handle the recordkeeping and track the status of specific mechanical components that must pass DOT’s annual vehicle inspection requirement. It also allows you to create detailed maintenance histories for both tractors, trailers, and other equipment. With this multi-faceted software, you can perform such functions as analyzing equipment costs, tracking vehicle usage, and creating tractor/trailer preventive maintenance schedules and cost analyses.

What can you expect of maintenance software? A basic maintenance software program tracks fuel, oil, and repair costs and schedules preventive maintenance intervals according to your system (PM). Inventory control for parts is often the next task that a manager likes to see computerized. As with most maintenance software systems *Keller’s Maintenance Manager* has an optional Parts Inventory module.

Ask software suppliers which personal computers their programs will run on and ask to see samples of their reports so that you’ll see exactly what information is given and how it is presented. Even better, take a look at an interactive demo that allows you to actually do some sample entries of information.

During your investigation of maintenance software, you should discuss your department’s needs at length with a competent consultant or salesperson. You will probably start by selecting some off-the-shelf software. Such packaged software has usually been debugged (errors identified and corrected) and proven in actual maintenance shop use. Consequently, there may be no dealer support offered — just a user’s manual.

If this is the case, check the user’s manual carefully and inquire from the dealer whether help will be available for you or your employees. It may pay off in the end to purchase maintenance software from a known supplier that also provides some kind of software support for users of the maintenance program. If you are part of a fleet, other transportation-related operations such as routing, freight billing, driver settlements, etc. may be part of an integrated fleet system (data is only entered once and is then available for other parts of the operation) in addition to the usual business functions like accounting, payroll, etc. Chances are a maintenance module is also available as part of the fleet’s system. If your shop is part of a private fleet, the main business of the company is not trucking, so you’ll have to examine any maintenance software more closely to make sure that it is compatible with the company’s other software and hardware.

Notes

Vehicle Maintenance Pro

Notes

The hardware which performs the task includes the computer or micro-processor itself and other components (peripherals), like the keyboard, display screen, printer, and storage in the form of hard-drive disks and disk drives (CD ROM or CD RW). Large fleets with several terminals may link the independent computers to a network or mainframe system. The hardware must be “powerful” enough to handle the tasks you want it to perform at the speed which you desire.

Maintenance records form a database, a large body of information which is continuously updated. It’s organized in such a way that any piece of information or collection of data can be identified, analyzed, and summarized. Databases are simply your files; a vehicle history, for example, is stored on a disk instead of paper — the information is added and updated as needed. The larger your maintenance operation is, the more records you will have and the more time it will take to sort and process whatever data you want to appear in a summary report. This aspect, too, will need to be discussed with your salesperson.

Consider who will be working with the computer in your operation. At the beginning, when building up the database by keying in past history and repair order data, you’ll probably do some of the work yourself to see how the system works and then hire a clerk to complete the chore. (You’ll be running both the manual system and the computer system concurrently for a couple of months as a check when the computer first goes “on-line”.) Will this individual continue to input daily information? Do you want the mechanics or parts person to handle the keyboard? Will you be doing it? Remember that good reporting depends on error-free information going into the system.

There is always one large concern with any shop system. Is it user-friendly? When the system is demonstrated, check how easy the program is to use; does it “prompt” the user, for example? Are there point and click or pull-down possibilities, or will everything have to be typed. Can other computer files be imported rather than having to be typed in? Can the system work with onboard computers on the equipment (with the correct software installed of course) and laptops that may be in use in the shop?

How “user-friendly” the system is and how well it cooperates with other computers already in use may be very important in how quickly it is accepted by employees. It’s true that some measure of discipline is also required in getting full value out of any computer. When computers first became available, users soon realized that one had to input data almost every day to really put the machine to work. Data must be entered methodically and on a regular, timely basis. The more user-friendly and cooperative the system is, the more readily it will be accepted.

One of the advantages of having an in-house system is the immediate availability of the latest information. However, if data is several days old before it’s even entered, you will not see the full advantage of the system. You’ll have to establish an orderly flow of information within the shop to accomplish this. What sort of reports will you be looking for from the maintenance software you buy?

We have discussed how coding the ROs (the use of VMRS or a similar system) can make the information contained on them easier to process.

Shop Operations

Similar information can be code-keyed in from parts receipts, fuel and oil receipts, outside vendor invoices, etc.

Your challenge will be to manage all this data, so it pays to start slowly and know what you want. Deciding what reports you want the computer system to generate can help you determine what you need to be entering up front.

Cost comparisons are the most frequently requested reports for any fleet. They give month-to-date, year-to-date, and life-to-date costs per mile (or other measurement) for vehicles and components. Component analysis by life-cycle tracking (vehicle and component histories) is another aid to the small fleet. Identifying repeat failures can lead to better PM scheduling in order to check the component before it fails or to allow better specs to begin with.

Troubleshooting. A manual shop system doesn't offer the quick spotting of rework jobs and problem components that a computerized system does. And don't underestimate the value of a computer printout when dealing with component and parts vendors about prices, warranties, etc. Nothing supports your argument like accurate documentation.

PM scheduling tells which vehicles are due for inspection/service according to mileage, hours, days, or weeks. An overdue vehicle summary report is thus possible. PM scheduling and reporting should be tested before making a purchase commitment. In some systems, the scheduling portion of the maintenance program can be fed with dispatch information, putting the maintenance personnel on notice that a specific unit that is due for work will be at a maintenance facility on a specific date or specific time, making scheduling shop time much easier.

Some programs can generate ROs or purchase orders (in the case of an outside vendor shop) based on this information that can include the "necessary parts" list for the scheduled work.

Trouble alerts (flags) are something else these systems can provide. If a technician or supervisor puts in a specific part or job number, and the cost or hours are way over or way under the norms, some systems will immediately report this or "flag" the part or job for inclusion in the next error report. The key then will be to figure out if you actually did pay \$200 for a windshield wiper, or if someone has made a recording error. Common problems are that someone used the wrong part number (such as replaced the wiper motor but used the wiper part number) or grouped work that belonged to another job to the one in question. There also is the possibility that you actually did pay \$200 for the wiper, and you would want to know that to make sure you did not use that vendor again! Either way, you would want to know about the incident so you could investigate it!

Fuel consumption reports mpg performance of different vehicles, based on the fuel receipts. It may be possible to print a summary report comparing the same vehicle over time or several vehicles (in order of fuel economy).

Inventory control lists maximum and minimum levels for each part and can automatically print out a "need" list when levels are at the minimum.

Notes

Vehicle Maintenance Pro

Notes

If your RO form has time-in/time-out recording space for mechanics' time, you'll be able to assess **shop productivity** according to your standard repair time. You can compare a mechanic's individual progress over time and measure his performance against that of other employees.

Direct versus indirect time. Having the ability to get a report showing both shop-wide and individual direct versus indirect time can help provide the information necessary to make the shop more productive and efficient, or verify that it already is productive and efficient.

A report on **scheduled maintenance versus unscheduled maintenance** is a good indicator of the health of your program, and therefore a report you will want from your system.

Summary

All of this recordkeeping, tracking, and analysis should mean better vehicle utilization, better scheduling of PM and component replacement, and a reduction of other repairs, which should lead to a lower cost per mile. It also provides the proof that the maintenance plan is working.

Evaluation of one manufacturer's product versus another is a nice benefit of effective recordkeeping. Also, your warranty claims will have some teeth when you submit examples of careful recordkeeping.

Also, recordkeeping and PM go together. Any time equipment changes (new components, new tires, new vehicles) you may need to modify your PM schedule and/or inspection/service checklist. Your recordkeeping and the reports it can generate are what will show you what changes are necessary in your PM standards.

Let's finally review what documenting and recordkeeping should do for your department:

- Identify fuel and oil consumption problems.
- Identify part and component failures for analysis.
- Identify rework situations.
- Identify high-cost maintenance areas.
- Identify trends in repairs and costs (up or down).
- Identify cost-effective vehicle and component models, makes.

Notice that we've used the word "identify" every time? That's all your records can do. You have to take action to correct the problems or negative trends identified.

Information is essential to good management and good decision making. Reports (whether computer-generated or hand-generated) are helpful only because they put information at your fingertips more quickly. But they are only a tool. You'll need to keep all lines of communication open in order to make good decisions that benefit the fleet. Improving your maintenance recordkeeping won't solve any problems for you. It will only identify them so that you can take corrective action.

Shop Operations

Good information is essential to good management, and the maintenance shop is no exception. Records can help you manage your maintenance standards and keep the fleet's vehicles running safely and economically.

Shop Operations Operational Planning	Notes
The operational plan — What is it? The operational plan is an essential component to any business plan. It tells you and others how you are going provide your product or service, in this case your mechanical department services, to the end users. That is, how are you going to get your service out of the garage and into the hands of the people you want to use it. Furthermore, how are you going to describe and justify the plans, goals, and actions of your department and your people to upper management so that they embrace and accept the idea of an in-house maintenance facility. Operational plans are typically structured to answer the following: • What are the major objectives of the department • What are the major tasks that need to be completed to meet these objectives and who is responsible for them • What is the financial impact (positive and/or negative) that this department and operational plan will create for the company This is important because you are now dealing with practice and not theory. Up to this point, you may have only discussed the “possibilities” of a maintenance shop but now it is a reality and you must prove its worthiness to the rest of the company. Operational planning deals with the fundamentals of your department or facility and all to often, overlooking fundamentals due to the perception that things will take care of themselves leads to the downfall of the department and possibly even the company. What should an operational plan cover? Operational plans should be specific to your department. Not all departments require the same level of complexity when it comes to the operational plan. It’s important to note that your operational plan needs to make sense to you, your employees, and upper management. It needs to be detailed enough to make sure that all pertinent areas of operation are addressed but clear enough that anyone reading it understands the content. Basically, what you must accomplish with your operational plan is an explanation of how you are going to deliver your service (the shop and all it provides) to the customer (the drivers, employees, etc) and what you and your employees are going to be doing on a daily basis from the time you open to the time you close.	

Vehicle Maintenance Pro

Notes

Why do operational planning at the department level?

The success of any company's operational planning effort is in direct proportion to the degree that such plans are developed and implemented at the unit or department level. For departmental managers to accept the responsibility for doing an effective job of department planning, they must perceive that the effort required will result in a benefit for them individually and for their department, as well as for the total organization. If the perception is that planning is just more work with no direct payoff, the Maintenance Pro is not going to participate in the operational planning process in a productive way.

Department operational planning provides a vehicle for both understanding and influencing the total organization's plan and those portions of the plan for which the department manager will be held accountable. The assumption is that those that are on the front line of productivity are more likely to know what is required to achieve desired organizational results than those who may be several levels removed from the action. It is difficult for a V.P. of operations in the main office to create an operational plan that is realistic and productive, if he/she has not operated at the "floor" level and has not coordinated this plan with the Maintenance Pro.

Department planning is not something that is done in a vacuum, solely by the Maintenance Pro. The Maintenance Pro has several "others" with whom planned and coordinated efforts are necessary. These include employees, people in other parts of the organization, higher-level management, suppliers, and customers. The establishment of a clear operational plan for the maintenance department, with particular emphasis on objectives and action plans, identifies what roles these "others" need to be playing in order for the planned results to be achieved.

Furthermore, a department operational plan created in this manner allows for a sound basis of getting the active involvement and commitment of all employees as well as establishing clear accountability for results. In addition, department action plans provide a means for clearly identifying others with whom early coordination and mutual support are essential for plan implementation.

The six elements of operational planning

Operational analysis — This is an assessment of the current status of the department's performance and of the specific issues that have substantial impact on the department during the year. These are identified from:

- A review of the strategic plan for short term needs
- A review of the prior year's operational and maintenance plan concentrating on performance issues
- Pinpointing other issues and problems likely to impact the department during the plan year

Shop Operations

Key results areas —These represent those priority areas within which results need to be achieved during the projected operational planning period. While operational analysis brings attention to critical issues or problems, the use of key results areas ensures continuity in performance areas that may not be represented by a problem. At the maintenance department level, this would consist of the expected outputs of the department and more specifically, the expectations of employees of the department, quality improvement, cost control, and employee moral.

Indicators of performance —The indicators of performance identify those measurable factors within the key results area on which specific objectives may be set. Since there are many ways in which results can be measured, it is important that management clearly identify and agree on those indicators that will provide the best visibility on desired results.

Indicators that can be quantified, such as units of production (man-hours/job), cost of parts and materials per job, and percent of return work due to failure, are all very useful and usually easy to track. However, other indicators that are not as easily quantified, such as employee satisfaction, new product/process introduction, and new program/process implementation, are also valuable in assessing the type of results desired. In any case, the indicators selected must be understood and agreed to by those involved.

Operational objectives —These represent the specific, measurable results to be accomplished within the time span of the of the operational plan. In other words, what are the exact expectations in a measurable form, of the maintenance department for the upcoming year? These objectives derive from the key results areas and incorporate indicators of performance as the measurable factors into the objectives themselves.

At the department level, objectives need to be narrow, precise, and specific. They contribute toward the broader organizational objectives but relate mainly to the specific department. For specific results that are not continuous in nature and may not require detailed action plans, such as minimum gross margin or monthly mechanic production quotas, the use of performance standards may be more useful. A standard of performance represents a level of achievement to be reached and maintained on an ongoing basis.

Action plans —Actions plans represent the specific actions required to accomplish each of the operational objectives. They may be stated in one or a combination of the following three forms:

- Specific activities or events that are not necessarily interrelated
- A series of interconnected events following an analytical or problem-solving approach
- A series of smaller or shorter-term objectives

Action plans include specific time frames, resource requirements, and accountability. They also should include appropriate feedback mechanisms so that management can verify that the plan is being met.

Budgets —The primary purpose of a budget is to indicate the level of financial resources required for the department to achieve its objectives. While budgets appear as the final element in the operational plan, they

Notes

Vehicle Maintenance Pro

Notes

are an integral part of the process and, as such, they normally provide a financial structure for plan operation. Operational planning, including the preparation of budgets, should be seen as an interrelated process throughout, with information generated in one element directly influencing the content of another.

Maintenance specific operational planning

Maintenance facilities are possibly the easiest to make operational planning decision on. The number of vehicles, the frequency with which they will require maintenance and repairs, and the amount of time spent on maintenance and repairs, will provide the justification for the size and cost of a maintenance facility.

If a fleet of 50 vehicles is operating vehicles that require 4 hours per month in preventive inspection and maintenance, the facility needs to be able to provide 200 hours of preventive maintenance per month. Assuming the vehicles can be scheduled to keep them "spread out" during the month, this alone will be enough work for one to two technicians. This is arrived at by dividing 200 hours by 160, the average number of hours a technician will work in a month = 1.25 technicians.

If the same fleet is also seeing vehicles spend an average of 2 hours a month in the shop for unscheduled repairs the company would need to provide 100 shop hours per month for repairs. If you divide 100 by 160, this justifies an additional .62 of a technician. You will then need to adjust this for vacations and other time off.

When combined with the preventive maintenance requirements, this now justifies two technicians and maintenance bays. Next, take all other responsibilities, the time to complete them, plans for future growth and factor those into the maintenance facility following the same model.

Each technician will need their own work space, so the facility would need to provide space for either one or two technicians (normally a service bay with a workbench and work area next to it).

If you intend to do your own heavy maintenance (engine and transmission rebuild and replacement, etc.) you will need to provide additional floor space in the maintenance facility. This will allow these long-term repair projects to sit in the shop and not cause delays in the other maintenance functions. If additional space is not provided the floor space will have to be cleared every time another vehicle needs routine maintenance or repair.

For planning purposes, figure that five percent of your fleet could need heavy maintenance at any given time. If the fleet has 50 vehicles, then two to three of them could potentially be in for heavy maintenance at any given time.

Other considerations when making maintenance facilities decisions include parts storage, wash bays, inside equipment storage, oil and grease movement systems, racks or pits, and maintenance office space (if not sharing office space with operations).

Shop Operations

How much privacy do you wish to provide for supervisors and other employees? How much of a support or clerical staff are you planning for (if any)? If you want full privacy for all employees, your facility will become quite large. Each employee will need a space for storing job-related materials, and some supervisory personnel will need private work areas.

One general concept applies. The more employees you have, the more space will be required. How many employees you have, how much workspace you intend to provide each employee with, and how many employees you intend to provide with private space, will determine your facility requirements.

Here is a worksheet that can help with these calculations.

MECHANIC STAFFING WORKSHEET

A. Calculating the mechanic-hours available for a year:

Number of days per week $\times$ 52 = _____ days

Subtract number of vacation days - _____ days

Subtract number of holidays - _____ days

Number of available working days for one mechanic _____ days/year

Number of available working days per mechanic $\times$ 8 hours = _____ hours/year

Subtract rest room/coffee break, personal cleanup hours,
_____ minutes/day $\times$ available working days - _____ hours/year

Subtract estimate of hours (use ROs) of other daily shop tasks, unrelated to repair, i.e. bay cleanup, parts checkout, shop meetings, training, _____ minutes/day $\times$ available working days - _____ hours/year

Subtract estimate of hours spent on other activities, i.e. shop meetings, safety meetings, training sessions, sick leave, personal time off _____ hours/year

Total hours available to work on vehicles per mechanic _____ hours/year

B. Calculating the annual shop PM/repair hours for a single vehicle (from last year's ROs):

Vehicle Number _____	Annual Mileage _____	Year _____
Type of Repair?	How many times?	Total hours?
PM Inspection/Service	_____	_____ hours
Repair (unscheduled)	_____	_____ hours
Tire work	_____	_____ hours
Total for vehicle	_____	_____ hours

If fleet has fewer units (particularly if vehicle age varies), complete a repair hours summary for each unit to give a more accurate picture.

C. The total number of vehicle service hours for all fleet units divided by available mechanic hours = number of mechanics needed

_____ service hours $\div$ _____ mechanic hours = _____ mechanics

Notes

Vehicle Maintenance Pro

Notes

On-road repair plan

One key operational plan that needs to be in place is how you intend to deal with on-road repairs. There are several plans in use at carriers. Here is a sampling of some of the practices used in these plans.

Parts and repairs PO

Some carriers require a driver to get a purchase order (PO) for any purchase of parts or services on the road. This PO can be required for every purchase, including at preauthorized maintenance locations.

The POs are assigned out of a book (or computer program) that assigns them sequentially. The technician or supervisor must “sign for” the PO, authorizing the repair. Other required entries are the date, vendor, location, driver, vehicle, and reason for the repair. This way, the PO can be tracked back to date of issue, vehicle, driver, etc., and who authorized the purchase is also recorded.

The advantages of using a PO system is the Maintenance Pro:

- has a clear accounting of purchases being done on the road,
- can control on-the-road purchasing (through the authorization step), and
- can keep track what drivers and vehicles are requiring more on-road repairs.

Full or partial on-road repair

On-road repairs have the possibility of getting very expensive. One possible solution used by some carriers (in certain circumstances) is to have partial or temporary repairs done on the road (or use inferior, cheaper parts). This is normally done only to get the vehicle roadworthy. Once it returns to the maintenance facility, it is then fully repaired. This is a decision that should never be taken lightly.

If you have decided to not fully repair a vehicle, you have exposed the company to a considerable risk. If the vehicle is involved in a crash, you could end up accepting an excessive amount of liability, even if the defective parts had nothing to do with the crash. Here is the question you need to ask yourself: Are you willing to accept responsibility and explain why you knowingly allowed a vehicle in less than perfect condition to operate on the roadway? If you can say that the decision was made with the safety of the driver and public in mind, and in compliance with the regulations, you should be safe taking this path. If the best you can say is “the vehicle shouldn’t be placed out-of-service if it is inspected,” you may want to reconsider your decision.

The next consideration is: How much are you actually saving by having the driver bring the defective vehicle in, rather than having it repaired on the road? If the additional downtime or repair costs in your facility will swing the calculation to the point that the total repair costs will be equal to the road repair, you may as well have the repair done on the road.

Shop Operations

Using inferior part is another short-term solution, and possibly the least risky. The disadvantage of doing this is the same disadvantage as having temporary repairs done on the road. You will have to repeat the repair when the vehicle returns. Here again, this second repair (and the associated downtime) may increase the total cost of the repair to the point that the repair may as well be done on the road in the first place.

One option that should always be avoided is operating a vehicle that is clearly in violation. This has disaster written all over it. We discussed the possibility of having to explain your actions if you allow a driver to operate a vehicle after partial or temporary repairs. Imagine trying to explain to an authority why you knowingly allowed an unsafe vehicle to operate on the roadway. "Because it was cheaper to get it here for repairs" will not help.

Contracted shops

One method many carriers use to reduce on-the-road repair costs is to establish contracts or agreements with repair shops in primary operating areas. By predetermining repair costs (agreed on shop and parts rates), the Maintenance Pro at these carriers can keep road-repair costs minimized.

Along the same lines some carrier equip the vehicles with parts that are known to fail (or training the driver to perform simple, but common repairs). One fleet that was experiencing problems with fan belts placed a fan belt in the equipment box of each vehicle. This way, all that had to be paid for at the higher rate was the labor to change the belt.

Summary

Operational planning, to be truly successful, is dependent on the active support of all departments within an organization. For this support to happen consistently, department managers must perceive such benefits as:

- A feeling of being in control
- More productive use of personal and department time
- Improved communication and coordination with others

The process for developing departmental operational plans is similar to that for the total organization, although departmental plans will be narrower in scope and will cover more detail. Department plans can be facilitated through:

- Identification of department issues and expectations in support of those at the top
- Review of the objectives and action plans of the department and the organization
- Classification of objectives into routine/regular, problem-solving, and innovative

Notes

Vehicle Maintenance Pro

Notes

Finally, the members of upper management need to reinforce the importance of involvement and commitment by department managers in the operational process. Without their active support, operational planning is unlikely to produce the desired organizational or departmental results.

	Notes
Vehicle Systems and Specifications Requirements and Accessories	
The purchasing process There is little doubt that equipment purchases represent a significant investment for any size carrier. Therefore, the process of selecting the best possible equipment at the best possible price is critical. A Maintenance Pro should have a positive role in this process as they are the front-line expert when it comes to the operational specifics of the vehicles. Among the most important aspects of the purchase process is making sure you purchase equipment that is designed for the job and the company. This can be both a pleasant and challenging task assigned to any Maintenance Pro. But whatever equipment is selected, the Maintenance Pro must know that he/she is going to have to live with the vehicle and its components for years to come. Several areas must be considered when deciding what vehicles to purchase for the organization, including: • Productivity — Depending on your type of operation, productivity could mean maximizing payload or available trailer space within the legal limits for the vehicle's size and weight. In order to maximize productivity, the equipment must have sufficient power (while delivering acceptable fuel economy), and components and accessories capable of carrying the load, to safely accomplish the work it is intended for. • Life-cycle — As stated previously, equipment purchases represent significant investments. One way for companies to ensure a decent return on these investments is to extend the productive life of the equipment. Carriers can accomplish this by establishing a proactive and aggressive preventive maintenance program. On the other hand, many carriers operate under a definite equipment trade-in schedule. But even in these situations, maximizing return on equipment investment needs to be a top priority. • Driver-friendliness — With driver turnover a major challenge facing the trucking industry, purchasing equipment that is driver-friendly has become vital. Fortunately, with advancements and improvements in vehicle ergonomics, there are more options available than ever before. • Matching the equipment to the job — Buying too much vehicle means that you're spending more money than is necessary to do the job. Buy too little and the vehicle will not be able to perform as the vehicle engineers intended. Buying too little vehicles can also lead to overloading or overworking, which inevitably will cause premature wear and tear on the vehicle and its components, increasing maintenance costs for the vehicle.	

Vehicle Maintenance Pro

Notes

- Cost — Purchase, operational, and maintenance costs must be considered. New equipment may be expensive to purchase, but may be able to show a better Return On Investment (ROI) based on lower operational and maintenance costs. This is because newer equipment tends to be more efficient to operate and will be less prone to expensive maintenance and overhauls. Also, warranty coverage provided by the manufacturer can help absorb some of the carrier's maintenance costs.

The up-to-date Maintenance Pro must also be aware of proposed state or federal regulations that might affect the vehicle's size, weight, and emissions control in the future. Many new vehicle configurations evolve from these limits. As emission controls become tougher, new fuel controls and exhaust systems must be developed to meet the requirements while still maintaining or improving efficiency. In addition, new or revised regulations might impact the specifications of safety accessories and components.

Another thing to take into consideration is the evolving and/or changing scope of the organization's service. The operation itself must be reviewed. Have changes occurred that require a different kind of equipment? Will the vehicles be traveling to a new geographical area? Are new marketing strategies being planned that will require the vehicles to perform a variety of tasks? Can one new vehicle replace two old vehicles because of operational changes or vehicle improvements?

Whether purchasing with the intent of using a life cycle, or making decisions based on present performance of the vehicles, the Maintenance Pro must work with the other managers (operations, safety, and finance) and making a conscious decision on vehicle replacement.

As equipment is the largest investment at a carrier, we will want to spend a considerable amount of time discussing the process of specifying, or spec'ing vehicles. Whether leasing or purchasing, the first step is to determine the requirements for the new vehicles. It is best to have this determined before calling the first dealer for information.

Once you have your specs, the next step is to approach dealers for their input and pricing. If you do not have your specs in place, the dealers will try to sell you what they believe may be best suited to your application (and possibly most expensive).

One area that carriers need to be familiar with is "economy of scale." The more identical units the vehicle manufacturer can build in a "run," the more willing the dealer and manufacturer will be to provide a discount. If a carrier purchases one vehicle per quarter, rather than four on the same order, the carrier will see a higher cost per unit due to the dealer and manufacturer being unwilling to provide a discount.

Vehicle Systems and Specifications

Equipment specification

While the Maintenance Pro may not personally develop or select new vehicle specifications, he or she should be familiar with the principles involved. At the very least, the Maintenance Pro needs to be involved in the process to provide input as to how the new equipment specifications will impact operations, maintenance, and reliability based on past experience, among other issues. Tomorrow's headaches can be avoided if these items are considered during the selection process.

Undoubtedly the first questions to be considered early in the process will concern the product that is being hauled or the payload. The questions should go something like this:

- What is the product?
- How is it shipped?
- What does it weigh per case, gallon, pallet, etc.?
- How much is shipped per trip?
- What does the total payload weigh?
- What are the dimensions (cubic feet, gallons, etc.) of the payload?
- How is the product loaded? Unloaded?
- Are there any special handling procedures for the payload?

As you review this list of questions (and try to think of more), think about what effect the product hauled has had on the vehicles. Have there been any persistent problems with the vehicles? Are the crossmembers adequate? Should flooring be strengthened? What about sidewall, liner, and flooring materials? Is a lift gate or other special equipment available that can make the vehicle and driver more efficient?

This process must be undertaken any time new equipment is to be purchased. It must also be repeated every time there is a change in the customer base which affects the products being hauled. Vehicles purchased with the intent of hauling only dry products may receive unintentional structural damage if you try to haul refrigerated or wet products in them. Mismatching the equipment to the product can also increase cargo claims and customer complaints.

Where the vehicle runs is as important to informed spec'ing as knowing what it carries. Anyone looking at a new vehicle needs to ask:

- What kinds of roads are used?
- What is the terrain like?
- What region of the country will the vehicle primarily operate in?
- How many hours are run during the day? at night?
- What are the speed requirements for a vehicle performing this kind of operation?

Notes

Vehicle Maintenance Pro

Notes

- Are there any special driving requirements (such as off-road operation)?
- Will the vehicle return nightly? If not, how long will the driver be “living in it?”

Once again, think back to see if any problems or complaints can be traced to the operating environment of the vehicles.

Answering these questions will begin the process of deciding what driveline, tires, and vehicle configuration will be required.

Much like the product information, the operating environment the vehicles are operating in should be reviewed with every vehicle purchased and any time there is a change in the customer base. Vehicles that were purchased to operate in a local application may not be well suited to operation in an over-the-road environment. The Maintenance Pro needs to be constantly aware of the products the vehicles are carrying and operational environment in which they are being operated.

“We have always bought model X with engine Y and kept them eight years” is not a sound method for deciding on new equipment. Changes in products or the operational environment may lead to accelerating vehicle purchases to replace vehicles that no longer match the fleet’s needs.

After drawing your own conclusions about the requirements for the new vehicle, it can be helpful to get input from the drivers and technicians. Suggest a meeting, a brainstorming session on what went wrong on the old vehicles and what participants would like to see on the new ones.

Talk to the technicians about the old vehicles. Were there any features that made repair difficult? Were any components hard to get at? Were any special tools required (that they didn’t have!)? Were some parts always on back order? In other words, was there anything about the vehicle that required special pains to repair and irritated technicians in the process? They won’t appreciate having the same hassles in a new vehicle. Ask them to point out the “model” vehicles in the fleet and describe specifically what makes them easier to maintain. Take advantage of the input they can provide.

Vehicle Systems and Specifications

Notes

Ask the drivers to critique the vehicles and, more importantly, about the performance of the vehicles on the road. What improvements have they observed in other vehicles? Is there any equipment that might speed up unloading or loading procedures? What special “extras” might motivate him/her to take better care of the vehicle? Ask drivers to make specific recommendations about the improvements they’d like to have in a new vehicle (promising nothing, of course!). Management isn’t obligated to take every suggestion, but listening doesn’t take long and it’s the first step in problem-solving. You can’t fix what you haven’t heard about.

It takes time to develop new specs and while the dealer will already have most of the available choices narrowed down, there are always additional components that may save enough money in fuel economy and/or maintenance costs to justify a higher initial price. It’s been estimated that only 20 percent of the total costs over the life of the truck relate to purchase price, so putting some extra cash into components now may be worthwhile.

You should be knowledgeable about new equipment options that are becoming available. Talk to other people in the industry to learn how the products are working out for them. Ask your truck dealer for opinions about components. If the dealership you work with has a service department, ask how components from different manufacturers have performed. Keep a file of ideas that look interesting and don’t hesitate to ask for advice.

Vehicle Maintenance Pro

Notes

Equipment Specification Guide

The above information has got you to the point where you now have a general idea of what you are looking for in a vehicle. The next step is to take the information gathered so far and work with the Operations Manager, Safety Manager, and dealers to spec the equipment. Here is a guide to follow that may help you to not overlook any key considerations when reviewing components.

- Product carried.
- Operational requirements.
- Cab configuration.
- Driveline (engine, transmission, drive axle(s)).
- Frame.
- Non-drive axle(s).
- Brakes.
- Electrical system.

Cab configuration. You know all the pro and con arguments about the cab-over (COE) versus the conventional cab. Each has its advantages and the final choice may depend on where the vehicle will operate or whether the drivers have a strong preference for one or the other.

Drivers like the conventional for its easy entry and exit and the extra room in the cab. Conventional also gives the driver a smoother and quieter ride. Here are some of the other benefits to conventional vehicles:

- The conventional costs less to purchase (when a sleeper is not required).
- It has better aerodynamics. Air flows easily around the nose of the conventional for better fuel economy.
- The optional lighter front can mean better maneuverability in certain applications.
- The longer length means the gross vehicle weight (GVW) can be spread over more truck, hence heavier legal loads can be hauled.
- Inspection is easier because the engine and steer axle components are easily accessible.

Conventional trucks are available in a variety of cab designs. One variation may offer the maximum in aerodynamics, while another may offer improved durability and less susceptibility to minor damage. One variation that is popular in certain applications is the “short nosed” conventional, properly known as the cab forward conventional. These trucks typically have a smaller hood area, and therefore a shorter wheelbase, which is accomplished by “tucking” the rear of the engine into the firewall. Combining a cab forward design with a setback steer axle has allowed for very maneuverable conventional trucks.

Vehicle Systems and Specifications

The greatest advantage to the COE vehicles is the short overall length and small turning radius. This means maximum maneuverability, especially good for city driving. The COE has become more popular in the light and medium duty markets, specifically in the “city” and “vocational” applications (garbage trucks, local delivery straight trucks, etc.). It is very seldom used by heavy duty fleets anymore. The cab forward, setback steer axle conventional trucks have taken the place of the COE in the heavy duty market. The COE does have some advantages:

- The short length also means that more payload volume can be accommodated in the body.
- Forward visibility is better.
- The short wheel base allows for easy handling.
- Overall better visibility and better maneuverability in confined areas.
- Once exposed (by tilting the cab) the engine and driveline are easily accessible. However, driver inspection is more difficult since the cab covers the engine entirely.

Engine. If you are in the heavy-duty market, the first step will be balancing the horsepower and torque to the expected working loads and environment the truck will be operating in, as the “gas verses diesel argument” does not apply.

Engine performance is judged by two elements, torque and horsepower. Torque gets a load moving; horsepower keeps it going at a particular speed. Engine torque can be measured by a dynamometer; horsepower can’t be measured, but it can be calculated from the torque measurement and the rpm using this formula: $\text{Horsepower} = \text{Torque} \times \text{rpm} \div 5,252$ (a constant developed by engineers).

Torque can be multiplied by mechanical means (i.e. a gearing system), but since horsepower is work done by the engine within a given time period, it cannot be increased or decreased by mechanical means. Accessory equipment such as alternators or fans, can drain away horsepower, however. So engines frequently carry two ratings for torque and horsepower — gross and net. The gross rating refers to its performance on a testing stand; the net rating is based on the performance of a fully-equipped vehicle.

Having said that, what engine is right for your equipment and operation? Perhaps the biggest thing to consider when selecting an engine package is to appreciate what the truck is going to do. What kinds of weights will it be pulling? What’s the nature of the work? Is the company more concerned with fuel economy or maintaining highway speed and having power left in reserve? “Roadability” (ability to get to and operate at road speeds on the roads the vehicle normally operates on) and “gradability” (the ability to pull the normal grades the vehicle will be exposed to both effectively and efficiently) are two engine concerns that are directly related to the torque and horsepower of the engine. The selection of the right engine must be based on these issues. If the vehicle is overpowered, there will be a loss in efficiency, but if it is underpowered roadability and gradability

Notes

Vehicle Maintenance Pro

Notes

will be affected. Also, underpowered vehicles tend to suffer from more mechanical problems.

The first question you will have to address if you are purchasing in the light or medium duty classes is the old gas vs. diesel question. You have probably been through this routine before, but let's review some of the advantages and disadvantages of each.

Gasoline engines

Advantages:

- Cost less to buy.
- Are a good choice for light duty trucks (under 19,000 pounds) that operate less than 40,000 miles a year.
- Are lighter weight than similar size diesel engines.
- Can be serviced by a wider range of mechanics.
- Generally are cheaper to repair.
- Start better in cold weather.

Disadvantages:

- Need scheduled maintenance more often.
- Consume more fuel.
- Lower power to size ratio.
- Less longevity and durability.

Diesel engines

Advantages:

- Lower overall cost of operation.
- More fuel efficient.
- Need less maintenance.
- Generally require less repairs.
- Simpler design-less to fail.
- Have longer overhaul intervals.
- High power to size ratio.
- Longer warranties.
- Run more efficiently during stationary applications (i.e. pumping).

Disadvantages:

- Cost more "up front."
- Higher torque requires heavier driveline components.
- Must be serviced by technicians with specialized training.

Vehicle Systems and Specifications

Most American and foreign-made medium and medium-heavy trucks sold in the U.S. are equipped with diesel power and this trend is expected to continue. Smaller, lighter diesel engines are available today even for the light-duty trucks and similar vehicles traditionally powered by gas.

When talking medium duty or “midrange,” know what you’re talking about. The term can refer to engines whose prices fall somewhere between the gasoline engines and the big diesels. Engines that are limited in the range of work they perform - either by weight carried or time operated at full power - may also be called midrange. Horsepower classifications, too, can run from 140 Hp – 250 Hp or 210 Hp – 290 Hp, powering from 20,000 lb GVW to the heavier weights. If you are selecting vehicles in this range, you’ll have to be careful not to underpower. Asking a midrange diesel to do a heavy-duty job is inviting a premature overhaul.

On the other hand, you should be sure that you’re only buying what you need. A midrange engine paired with lighter-weight chassis components might be just the ticket to better fuel efficiency. The fleet may need to start thinking about what’s needed to pull the load and not fall back on “old habits.” Once on the road, the drivers who complain about a lack of power may find that they’re getting there just as quickly.

Nearly all engines manufactured today are electronically controlled to one degree or another. Some of the smaller engines have only a small fuel/air management system, while most of the heavy duty engines are fully computerized. In the heavy duty engines, when the driver operates the throttle the Engine Control Module (ECM) adjusts the fuel and air flow to most efficiently achieve the performance the driver has requested.

Along with controlling the management of the fuel system, the electronic engines all have a memory. The memory is intended to shorten the diagnostic cycle in case of engine problems. How large, what the memory “remembers,” and ease of access to memory, are factors to be considered when choosing an engine. Some manufacturer’s ECMs will remember everything from a misfiring injector to hard braking done by the vehicle.

Notes

Vehicle Maintenance Pro

Notes

Fully electronic engines offer several advantages. First, they are considerably more fuel efficient than the older technology engines. This is accomplished by the computer and software constantly tracking engine performance and demands, then determining the most efficient way of operating. This decision is made several times a second.

Second, the engine electronics on some vehicles can be programmed to shut down the engine to protect it from damage. Should the oil pressure or level go too low, or the coolant level go too low or temperature too high, the engine will warn the driver and then turn off.

Third, the “memory” can be set to display “trouble codes” to the driver if a “check engine” or “shut down” warning light has come on. By activating the system the driver can get the trouble codes displayed on the dash. This memory can also be downloaded during PMs, shortening maintenance times. Downloading at each PM also builds a record on the way the vehicle was treated and operated. This can become critical in warranty discussions.

Fourth, the engine can be electronically “limited.” Part of the programming allows supervisory personnel to set the vehicle to go no faster, or generate no more power, than a pre-set limit. Once the speed, RPM, or power limit is reached, the computer will limit the amount of fuel to only what is required to maintain the desired speed, RPM, or power.

Finally, the engine’s memory can become useful in case of a performance problem or an accident. This feature can also be used as a method of tracking driver performance or discovering driver abuses such as over-speed, over RPM, excessive hard braking, and excessive idling.

If you are not going to train maintenance personnel and purchase the equipment required to “communicate” with the modern electronic engines (usually a laptop computer or similar device and specific software), part of the engine selection decision will need to be ease of access to manufacturer service. This way you will still be able to take advantage of the electronic engines without purchasing the necessary equipment and getting the training for your maintenance personnel.

As the engine is normally the most expensive component on the vehicle to purchase, maintain, and repair, another consideration when deciding on an engine is the warranty that the engine manufacturer offers.

Transmission and axles. The spec’ing process for the transmission should consider the ease of operation combined with the company’s ability to train and retain skilled drivers. Manual transmissions require less maintenance and are cheaper to purchase, but require a higher degree of skill by the driver. Automatic and automatically shifted transmissions are easier to operate, but generally are more expensive to purchase and maintain.

Most automatic transmissions available for trucks are in the 4 to 5 speed range. Most automatically shifted and manual transmissions are in the 7 to 10 speed range. Fewer gears generally equals better fuel economy. The trick is to make sure the transmission performance and gearing matches the engine performance, with the fewest number of gears.

Vehicle Systems and Specifications

The newer high torque engines do not generally require the complicated 13, 15, or 18 speed (or more) manual transmissions any more, except in special applications.

Automatic transmissions are now available in both hydraulic and gear drive configurations, both of which are electronically controlled. The hydro-drive transmissions use sensors and controls to shift the transmission at optimum shift points based on load, demand, and engine speed. Automatically shifted gear drive transmissions use electronic sensors and controls to shift the gears at specific RPMs. This transmission offers the best of both worlds. It maximizes efficiency and fuel mileage by not losing power to the hydro-drive system and does not require the driver to have a high level of skill to shift the transmission.

Rear axles just keep lumbering along, carrying the load, transferring the torque, supporting the suspension, handling braking shocks, and generally acting as the workhorse component of the vehicle. Selection of type, capacity, and gearing is keyed directly to the vehicle's job and operating environment. For example, some waste-haulers consistently spec heavier rear axles, it's cheaper to over-specify than to repair original equipment, they say.

New faster axle ratios have been developed to handle the slower speed engines and low-profile tires, designed for fuel economy. Brakes are based on the carrying capacity of the axle, so correct spec'ing here can prevent over-braking conditions as well. In heavy duty applications be sure to check into filtration systems that can keep the axle lube oil clean.

Engine and the total gear ratio, that is, the combination of transmission and rear axle ratios, make up "geared road speed" which is the maximum speed at which the truck will run with the transmission in top gear and the engine operating at its top governed rpm. Geared road speed is the engineered speed, governed by the mechanical factors of the engine and powertrain.

If you want a higher geared road speed, you'll have to make other mechanical changes. Faster transmission or axle ratio for example. Many rear axle ratios are offered to accommodate engine speeds that run from the low-rpm diesel to the high-rpm gas.

The real test for a vehicle's power is not necessarily shown by the engine power curve, but rather in its gradeability, or measure of the slope on which it can travel without loss of speed.

Gear-fast/Run-slow! As an engine becomes increasingly powerful (as with today's 500+ horsepower engines), the increased power is coming from high-torque/low-rpm settings as opposed to the more traditional low-torque/high-rpm approach.

Under gear-fast/run-slow, geared speed is higher than the cruise speed, allowing the engine to cruise at a modest 1400 to 1600 rpm. However, even at these low revolutions, the axle must be able to run fast at high-way speed.

Notes

Vehicle Maintenance Pro

Notes

Frame. Now that you have determined some of the basic information, the next step is to select a frame that can support the projected GVW, type of operation, and driveline.

The backbone of the frame is the side rails and crossmembers. In an effort to lighten the vehicle, an aluminum or aluminum alloy frame may be suggested. Whether a steel or aluminum frame is used, the strength rating of the frame must match the components and intended loads.

Heavy-duty applications may require a frame analysis, but generally if you are staying within the GVW that the truck was designed for, the standard recommended frame should be sufficient. The exception may be if you added any extra equipment or additional load to your vehicles. This might call for frame reinforcement.

When spec'ing the frame, also consider the suspension. Spring complaints may not be enough reason to bring a vehicle into the shop, but they can affect driver performance. Know ahead of time the weight that the truck must haul so that the springs can be spec'ed at the proper size. If the vehicle runs out loaded and returns empty most of the time, a solution may be more complex.

Air spring suspensions cost more than steel, but users insist that they require less maintenance, last longer, and increase truck value at trade-in time. They also have the ability to adjust the ride to changing weights, something spring suspensions cannot do. Also, air-cab suspension might ease driver backache — and make the cab last longer.

Non-drive axle(s). Weight rating of axles and tires are the main concerns when spec'ing axles. If the axles are correctly spec'ed, the brakes and other components will match the rest of the vehicle. The other concern is the location of the axles. In some applications the only other axle on the vehicle will be the steering axle.

One type of steering axle configuration that has been developed to help in weight distribution, as well as maneuverability and ride, is the “set-back steer axle.” In this configuration the steering axle is “set back” from the front of the truck, rather than in its traditional location directly behind the bumper. By placing the axle further back on the frame it is in a better position to assume more of the cargo weight, thereby lightening the weight carried on the drive axle(s). This position also allows for a shorter wheel base, leading to a reduced turning radius, which means a more maneuverable unit. Also, the setback axle allows for the use of longer springs which creates more spring flex, improving the ride of the unit.

Whether the vehicle is spec'ed with a standard or setback axle, the weight rating of the axle must match the projected load. This is critical with the steer axle, or the vehicle may suffer from steering difficulties.

Other axles can be either “dummies,” designed to stay on the ground and carry weight, or “lift” axles which can be lifted off the ground when not needed for load bearing. Dummies are a much simpler axle, costing less to install, while lift axles are more expensive to purchase but have reduced operating costs. As with steer axles, the key consideration is making sure the axle matches the weight that will be placed on it.

Vehicle Systems and Specifications

Brakes. Air-brake buyers have a choice of three types:

- S-Cam brakes, the oldest and heaviest choice, are the least expensive, simplest in design, and mostly trouble free. This is especially true since the introduction of the automatic slack adjuster and the non-asbestos lining materials.
- Wedge brakes, much lighter in weight and self-adjusting, can fade at high temperatures and require more air pressure to activate (nearly 10% of the brakes sold are wedge).
- Air disc brakes also require more air pressure, but they produce more torque, hence a more stable stop; they are self-adjusting and don't fade, but they generally have a shorter overall life and the pads have to be replaced fairly often. They aren't difficult to replace, however, and are becoming a more popular choice.

Capable of performing just as well as the air-braking systems (or better in some applications), a hydraulic system doesn't have the contamination problems that air-brake systems can suffer from and it weighs and costs less. There are fewer maintenance demands; timing problems are negligible and the system works well with automatic adjusters. When combined with electric or surge brakes on a trailer, these brakes work well in the light to medium class vehicles.

Electrical system(s). When spec'ing the electrical system, the output of the charging system must be matched to the total maximum demand of the electrical system. If you "underbuy" in the electrical system, the vehicle will be prone to draining its own batteries and requiring jump starting. This is one area where overbuying is a good idea.

One other consideration in the electrical system is the use of "shore power" to run accessories. This can be accomplished in two ways. The first is to have all accessories powered by 12 volts, and provide the vehicle with a system that converts 120 volts to 12 volts to operate the accessories. The other option is to have a system that converts 12 volts to 120 volts to operate the accessories when the vehicle is not connected to 120 volt shore power. Either of these can be combined with a "gen-set" mounted on the vehicle to provide 120 volt power to the shore system if the vehicle cannot connect to a shore line for some reason.

Battery selection for sleeper trucks will need to be viewed differently, due to the high loads placed on batteries when the truck is not running by driver accessories such as microwaves, inverters, televisions, DVD players, computers, video games, etc., if the vehicle will not be equipped with a gen-set. One Maintenance Pro refers to the electrical load on a parked sleeper truck's batteries as a "hotel load" as the typical sleeper cab's electrical load is the same as the electrical load in a hotel room (possibly a bit of an exaggeration, but not much of one)!

Due to this loading, the batteries will need to be selected based on their ability to cycle from a low voltage to operating voltage repeatedly. Consideration will also need to be given to the ability of the batteries to accept repeated "jump starts."

Notes

Notes

Another option is to consider a battery system that protects a “core charge” to start the truck (one battery or battery pack never supplies power to the cab and is reserved strictly for starting, or the battery system cuts power off to the cab when the battery voltage drops to a certain level).

Available accessory equipment

Air dryers reduce water, oil, and carbon contamination - the curse of any air-braking system. They operate on the principles of condensation, use of a drying agent (desiccant), or centrifugal force to clean and dry the compressed air before it is delivered to the system. If you think an air dryer might help reduce brake problems, check out its maintenance manual before you buy.

Engine braking has become important because the fuel-efficient truck models roll more easily and the new fuel-efficient engines have reduced natural engine-braking ability. Retarders fill the need for additional engine-braking; they spare the braking system, while allowing the driver to control the retarding power. They fall into four categories:

- Exhaust retarders have a control which closes the exhaust pipe, thereby creating back pressure in the exhaust system to slow the engine.
- Engine retarders and engine brakes change the valve timing or injector functions in the engine, thereby limiting the number of cylinders working (the venerable Jake brake is of this type).
- Hydraulic retarders cause the engine to work against a fluid system contained in a closed housing that is part of the transmission.
- Electric retarders consist of electromagnetic coils which produce a drag force on the truck's driveline or trailer axle.

Maintenance-free batteries:

- Require less frequent checks for water levels,
- Reduce actual water loss from the cells, and
- Minimize corrosion.

Whatever the choice for batteries, don't allow price to be the only consideration. Vibration test information can be an important key to how long a battery will last, yet one manufacturer reports that fleets seldom request this information when considering a brand. A new container material, structural foam polypropylene, is available instead of the usual hard rubber and thin-wall polypropylene. This newer material weighs less and seems to offer better resistance to vibration.

Fuel heaters can keep the flow going smoothly. Choose a mechanically simple model that heats the fuel before it goes into the first fuel filter and also prevents overheating of the fuel. Since the primary fuel filter and its supply line are the most common component affected by cold weather, it may be helpful to choose a model located in the engine compartment; avoid those mounted outside the frame rails where they are exposed to wind.

Vehicle Systems and Specifications

Water separators can be used in combination with a primary fuel filter or separately to keep water and other contaminants in fuel from reaching the engine. Since they must be drained regularly to prevent freezing, be sure they're conveniently located.

Aerodynamic accessories can significantly increase fuel mileage. Air resistance is a truck's second greatest impediment to movement, and therefore optimum fuel economy. Only weight impacts miles per gallon more. Efficient aerodynamics smooth the flow of air over, under, and around the vehicle. It is not uncommon for some aerodynamic truck/tractor designs to save carriers as much as 4–5 cents per mile in fuel savings. When spec'ing accessories for fuel economy, start with the full-cab roof fairing. Make sure it matches the height of your trailers. A proper roof fairing can improve Miles Per Gallon (MPG) performance up to 15 percent when compared to operating without one.

Other aerodynamic accessories include:

- Cab extenders, which are designed to bridge the gap between the truck cab and the trailer. The goal of these extenders is to attempt to reduce the gap to less than 18 inches.
- Side skirts, which cover the fuel tanks and battery box, and smooth out the overall profile of the truck.
- Air-dam front bumpers and aerodynamic hoods which are designed to ease air flow around the front of the vehicle.
- Other aerodynamic accessories (or aerodynamic location of accessories), such as mirrors, air intakes, air horns, and grab handles.
- Trailer air deflectors including nose and rear "bubbles," side skirts, and axle air deflectors. Any of these options can increase fuel economy by 1–3 percent.

Tire size does matter since a truck's overall gearing changes with the diameter and circumference of its tires. Tread type also impacts fuel economy because a tire's tread helps determine rolling resistance. For example, a lug-type drive-axle tire in winter will improve traction, but will also lower fuel economy by 2–4 percent. Tire technology has improved dramatically recently. With improvements in tread designs, casting designs, rubber compounds, and friction reduction, definite and significant savings can be realized by spec'ing the right tires for your equipment.

There are many other accessories that you may be aware of, that don't necessarily relate to the functionality or dependability of the vehicle. When purchasing vehicles you can often get wrapped up in the bells and whistles that are offered. Caution should be used when presented with a laundry list of added "features" as these do not generally help the vehicle's operation and they negatively impact the bottom line.

Vehicle Maintenance Pro

Reserved

	Notes
Vehicle Systems and Specifications Improving Fuel Efficiency Driver habits and performance Driver habits and performance can be one of the largest factors in fuel mileage. The driver's driving techniques can influence fuel mileage as much as a mile per gallon. Communicate correct driving techniques to the drivers and emphasize the importance of using them. Here is a list of driving techniques that can improve fuel mileage: • Progressive shifting, • Low RPM driving, • Operating at a slightly slower speed, • Maintaining steady speeds, and • Idle reduction. Progressive shifting and low RPM driving. Training drivers on progressive shifting and low RPM driving is typically a safety/training department function. However, by downloading engine data at the time of service the Maintenance Pro may become involved in the process. High RPM spikes and high average RPMs are typical of a driver not using progressive shifting or constantly operating at high RPMs. Typically, these drivers believe that to get the engine to perform correctly the engine must be kept at high RPMs and that maintaining high RPMs will reduce the number of shifts that are necessary. Both of these points are false. As you know as a Maintenance Pro, torque, not high RPMs, is what makes an engine perform well. Keeping the vehicle at high RPMs keeps it above the peak performance areas. Also, if the driver is downshifting at high RPMs, the driver is never giving the engine a chance to pull (downshifting before even getting into the engine's peak torque range). Finally, there are software programs that can be installed on engine computers that limit the RPMs at various road speeds. These programs force drivers into using progressive shifting. This should be considered if the majority of the fleet has a problem with not using progressive shifting. Slower speeds. Some drivers believe that a vehicle can be equipped to operate efficiently at any speed, if the driveline is correctly configured. What these drivers need to understand is that speed equals air resistance. No matter how efficient the driveline is, air resistance cannot be avoided. Fuel mileage drops as much as 5 to 8 percent for every 5 miles per hour over 55 miles per hour (depending on vehicle configuration), no matter how well it is geared. Graphing the air resistance can many times demonstrate the issue to the drivers.	

Vehicle Maintenance Pro

Notes

Here again, typically the people who train drivers will be involved in the actual training. However, downloading data and observing high speed spikes and high average speeds will get the Maintenance Pro involved. The Maintenance Pro can also lend the training person expertise and facts in this area.

Speed reduction through the use of the vehicle fuel management computer is another high-tech solution. By reducing the speed at which the vehicles are operating, the company can realize a considerable fuel mileage improvement. This will normally generate a considerable push-back from the drivers (and possibly increase driver turnover), as reducing the speed at which the vehicles operate will reduce their income.

Here is an additional note on speed reduction. Speed limiters are the law in the provinces of Ontario and Quebec, Canada. The intent is to reduce pollution, increase fuel mileage, and improve highway safety.

All large trucks operating in the provinces of Ontario and Quebec must have their speed limited to no more than 105 kilometers per hour, or 65.2 miles per hour. The present provincial speed limit for large trucks on major highways in these provinces is 100 kilometers per hour, or about 62 miles per hour.

The carrier operating the vehicle will be responsible for compliance with the law. Carriers that have the technical know-how and correct equipment (hardware and software) should be able to do the programming themselves. If the carrier does not have the know-how or equipment, the programming will need to be done at a dealer or repair facility that has the correct capabilities.

As much as is practical, the speed limiter will need to be tamperproof. Once it is set at the appropriate speed, the driver is not to have the ability to alter it. Proof of not having an operating speed limiter will be a speed citation exceeding 105 kilometers per hour. In theory, a speeding violation in excess of 105 kilometers per hour could result in two citations — one speeding citation issued to the driver and another citation issued to the carrier for not having an operating speed limiter on the truck.

Here is a key point: This law applies to every truck over 11,000 kilograms (roughly 24,250 pounds) operating in Ontario and Quebec, **regardless of**

Vehicle Systems and Specifications

where the vehicle is registered. Trucks entering Ontario and Quebec from other provinces or the United States will be required to comply with this law.

In the United States several major trucking associations and motor carriers, and several safety organizations have petitioned the United States Department of Transportation to consider similar regulations. That rulemaking is now underway, with a proposed rule due to be published some time in the future.

As well as limiting speed, the power of the engine can also be adjusted in many cases. Be aware, reducing the power the engine can generate may have the same effect on driver performance as reducing the vehicle speed, and may cause the same problems.

Maintaining steady speeds. A Maintenance Pro can notice certain driving behaviors when downloading the vehicle computers, and when performing maintenance, that indicate a driver is not maintaining steady speeds. Common indications are a high number of hard-brake incidents on the vehicle computer, and excessive brake wear on the vehicle.

What is typically causing this (high number of hard braking incidents and excessive brake wear) is the driver having to make radical speed changes due to not finding a good cruising speed and “running with traffic.” This driving habit causes a reduction in fuel mileage, as well as being potentially dangerous. As the Maintenance Pro, you may not be training the driver on good defensive driving techniques, but the information generated by your department can be critical to the people that do.

Idle reduction. Idle reduction can be accomplished through the use of various programs. The Maintenance Pro will need to be actively involved in the program. If the carrier decides to implement a fuel bonus program, the implementation would need to include initiating the use of hardware to track the actual percentage of idle.

Also, to make the program more acceptable to the drivers, the idling goals will need to take into consideration resting time for drivers of sleeper berth vehicles. The allowable idle time would have to vary based on the season, type of auxiliary equipment in use on the vehicle, and the primary run area of the carrier. As an example, drivers that spend a good deal of time in the northern states during the winter months will need to idle their vehicles for warmth, unless auxiliary equipment is used that can reduce the idle time.

One program is the use of a driver bonus program aimed at reducing idle. As with any bonus program, the difficult part is establishing the correct monetary reward. The concept with any bonus is to “share” the rewards of the desired improvements with the drivers. If the bonus is incorrectly set, the carrier can actually lose money due to the program.

If the carrier is already seeing low idle percentages, the program cannot financially support itself.

The next idle reduction method would be the addition of idle reduction hardware such as an auxiliary power unit (APU) to heat and/or cool the cab without running the vehicle’s main engine. The diesel-powered APUs that are presently available can heat or cool the vehicle for a complete

Notes

Vehicle Maintenance Pro

Notes

driver rest cycle using less than one-half of a gallon of fuel (as compared to $\frac{3}{4}$ to 1 gallon of fuel per hour of idling in heavy-duty vehicles).

Idle reduction hardware that can be installed on the vehicles includes:

- Phase charging systems that can cool the vehicle for up to eight hours without running the vehicle engine,
- “Shore line” systems that use 120-volt power from an outside source to heat and/or cool the cab while the vehicle is parked,
- Generators (gensets) that provide 120-volt or 12-volt power to the cab to operate heating and cooling systems,
- Heating and cooling “tubes” provided at truck stops that connect to the cab to provide heat and cooling to the cab,
- 12-volt heating and/or cooling systems that use extra battery packs, and
- Diesel cab heaters.

Several of these hardware systems use no fuel. Of course, there is the initial cost of the idle reduction equipment and the cost of installation, but this can be offset by the fuel savings, federal tax breaks, and other program involvement. One such program is the Environmental Protection Agency’s (EPA) “Smartway Transportation Partnership” program. This program provides low interest loans and grants to carriers who are willing to reduce emissions through the reduction of fuel usage.

There are also potential problems with heat generation, driver acceptance, and equipment compatibility that need to be addressed with these systems.

As with any other cost reduction plan, the company as a whole will need to study the costs and benefits of installing the idle reduction hardware.

Installation of idle reduction software is another high-tech solution to idling. The fuel management computer on most modern medium- and heavy-duty vehicles can be programmed to shut down the main engine after a predetermined number of minutes of idling.

There are software systems (some requiring hardware upgrades) that will automatically shut down and start up the main engine to warm or cool the cab of a sleeper truck based on the driver’s desired cab temperature. This allows for fuel savings by not running the engine if the driver does not need heat or air conditioning.

The starting point for any of these initiatives is the development and strict enforcement of a no-idle policy (if not sleeping in the cab, the truck is not to be running). To verify compliance with such a policy, the carrier may need to use (or install) onboard hardware and/or software to track driver performance. Typically, the Maintenance Pro becomes involved in these programs due to the increase in vehicle maintenance or improvements that are required. Also, vehicle maintenance checklists may need to be modified to include routine downloads of onboard computers.

The key is to equip the vehicle and motivate the driver to reduce idle. You cannot do one without the other. Simply telling drivers to reduce idle may not lead to any reduction if the drivers are already at the minimum.

Vehicle Systems and Specifications

Providing the vehicle with hardware or software may assist the driver in lowering the idle time.

Implementing a fuel bonus

Many drivers respond well to simple monetary bonus programs. A fuel bonus is such a program. Fuel bonuses can be used to motivate drivers to reduce idle time, keep their speed down, and improve their shifting.

The downsides to a fuel bonus program are the cost of administering the program, lack of fairness when comparing vehicles and run areas, and driver frustration.

As with any bonus program, the company will need to set the bonus levels carefully. Performing a study to determine how much money improved fuel mileage can save is the first step in establishing a bonus. If the program cannot generate enough savings to cover the direct costs and administrative costs of running the program, it should not be undertaken.

The lack of fairness (or perceived lack of fairness) is caused by several factors. Drivers that are assigned older, less efficient vehicles or operate on routes that require the vehicle to work harder, will have to make more sacrifices to make the bonus.

Setting the bonus levels low enough that they are achievable by all vehicles is one method to overcome this, although it is not preferred. Drivers with more efficient vehicles will not have to work to improve their fuel mileage, thereby reducing the overall effectiveness of the program. Establishing "brackets" for the different equipment is a fairer and more effective method. Example: Drivers with 2000 to 2003 vehicles must get 6.5 miles per gallon to qualify, while drivers with 2004 to 2006 vehicles must get 6.75 miles per gallon to qualify. If you are maintaining accurate records of vehicle performance based on vehicle groups (see the recordkeeping section of this manual), determining the appropriate level for each group is possible.

Driver frustration with a fuel bonus program can be caused by drivers believing the goals are unattainable. Another potential source for frustration occurs when drivers' maintenance or operational requests are not met, leading the drivers to believe the company contributed to the loss of the bonus.

If operating with a fuel bonus, the Maintenance Pro (and the maintenance department in general) will need to be extra sensitive to driver write-ups and complaints. You will need to be prepared to be challenged if the driver reported problems, but the problems were not resolved, and the driver believes that the unresolved vehicle problems cost him/her the bonus.

PMs will also need to be done on time, every time. This will keep drivers from being able to claim that they did not make the fuel bonus because of a lack of maintenance.

Notes

Notes

Equipment specifications

When spec'ing your equipment, fuel economy should be a major consideration. Fuel is normally the second largest operating cost for any motor carrier (just behind wages when measured as a cost-per-mile factor). Consequently, making a conscious effort to spec your equipment for maximum fuel economy makes for a sound business practice.

An aerodynamic vehicle design, combined with a productive and efficient gear ratio and the right engine, can make a tremendous difference in your fuel costs. However, when it comes to spec'ing for fuel economy, some specs or equipment modifications make more sense than others.

Spec'ing equipment that will maximize your fuel economy efforts is the best overall route to take. In general, today's vehicles are far more fuel-efficient than in the past, but you need to choose appropriately for the job the vehicle is going to be expected to do in your operation. The following are a few that will have the most impact:

Cruise Control. As a starter, plan to specify cruise control on any new equipment. Then program the control just under top-governed speed. Drivers will usually willingly give up two to three miles per hour in return for the freedom of not having to have their foot on the throttle all the time. It's almost a sure thing that cruise control will save fuel over what the driver can do manually.

Speed. Fuel economy tests have clearly shown that each one-mile-per-hour increase above 55 consumes $\frac{1}{10}$ gallon more fuel per mile. That means that a rig going 65 mph will get one less mile per gallon than the same rig going 55 mph, on an average. The faster a vehicle goes, the more horsepower it requires and the more fuel it consumes. Add variances in terrain and various additional factors to this picture, and you can see the importance of keeping drivers attuned to fuel economy.

During the spec'ing process you will want to consider ordering vehicles that operate at the slowest acceptable speeds, not necessarily the fastest.

Air Intake Restriction. Another specific thing to keep in mind is the fact that too much air intake restriction can cause up to a 4 percent drop in fuel economy. Why? For the first 80 percent of its life, the typical air filter gets dirty rather slowly, but once you pass that point, the filter plugs with dirt and other foreign substances more rapidly. As this happens, air intake restriction increases and the engine has to work harder to pull in air.

Engine manufacturers say the loss in horsepower equals the percentage loss of fuel economy. According to Donaldson Company engineers, increasing air intake restriction from 5 inches to 25 inches (in water) can result in a 3.4 percent horsepower loss. For a truck that runs 100,000 miles per year and gets 6.5 mpg, that works out to 43.5 gallons of fuel every month!

Exhaust Backpressure. Too much exhaust backpressure causes you to lose fuel economy too. How much is too much? Almost all turbocharged diesels have a maximum allowable backpressure of 3 inches mercury (Hg). By using a 1.5 inch Hg muffler, you can get as much as 1.5 percent fuel economy improvement. Before you spec all new mufflers, however, be certain that the replacements meet existing or proposed noise standards.

Vehicle Systems and Specifications

The diesel particulate filters (DPF) and selective catalytic reduction (SCR) systems that are being placed on vehicles to meet the emissions requirements can increase backpressure if not correctly spec'd and maintained. Many of these systems can be ordered with a "tell-tale" device or diagnostic system that notifies the driver (or maintenance through the onboard data system) that the system is approaching the need for service.

It is also important that these systems be monitored and maintained as part of routine PM to avoid excessive backpressure.

Fan and fan clutch. The engine cooling fan places a significant load on the engine when it is engaged. The less it runs and the smoother it engages, the better the fuel mileage. How and when the fan engages is determined by sensors in the cooling system and the fan clutch. When looking at engine fan systems and fan clutches, be sure to consider the affect they will have on fuel mileage.

Tires. Don't forget about tires in this picture. Fleets are increasingly spec'ing radial tires. They stand up better and give more tread life for the money. But a factor that managers often miss is that bias-ply tires require significantly more horsepower (40 to be specific) to maintain 55 mph than steel-belt radials. Using more horsepower translates directly into fuel consumption, so be sure you spec well when it comes to tires.

One other point about tires is the problem of under-inflation. If your tires are under-inflated, you can lose 1.5-3 percent of your fuel mileage. Because of the direct effect that tire inflation has on fuel economy (and the operational cost of purchasing and repairing tires), many fleets have gone to, or experimented with, electronic tire monitoring and automatic inflation systems. These after-market options continually monitor tire inflation and notify the driver if tire pressure is low in a tire. In the case of the automatic inflation systems, the system will bring the tire back up to

Notes

Vehicle Maintenance Pro

Notes

pressure after notifying the driver. Finally, be sure regular inflation checks are provided in your inspection system.

Tire size and type are also a critical decision. Tire size matters because a vehicle's overall road speed performance (and therefore the RPM requirements) changes with the diameter and circumference of its tires. If the driveline is not matched to the tire size, the vehicle may be operating at a higher than necessary RPM just to maintain the cruising speed. The reverse is also true. If the tires are too big for the vehicles the vehicle may be running at too low of an RPM when cruising, leading to other problems.

Tread type also impacts fuel economy because a tire's tread helps determine rolling resistance. For example, a deep lug drive tire will improve traction, but will also lower fuel economy by 2-4 percent.

Overall, tire technology has improved dramatically. With improvements in tread designs, casting designs, rubber compounds, and friction reduction, definite and significant savings can be realized by spec'ing the right tires for your equipment.

Equipment Replacement. Fuel consumption records should be one set of information used in making the decision to repair or replace a fleet vehicle. Weighing a 4.5 mpg figure for an older vehicle against a 6.5 mpg for a new one is a variable in the replace/repair equation that should be considered.

Lose weight. One option to improve fuel mileage is to reduce the weight of the vehicle. There are several spec'ing options that can accomplish this. Here is a short list:

- **Lightweight frame and body materials.** When spec'ing the vehicle, discuss the use of lightweight frame and body materials (aluminum, plastic, fiberglass, composite materials, etc.). Most manufacturers offer vehicle models that use lightweight materials to lower the vehicle weight. The question that needs to be answered if you consider this is: Is the lightweight model vehicle going to be strong enough to do the job?
- **Vehicle size.** Another consideration with the frame and body is "how big." Drivers and fleet managers may love and want big vehicles (whether it is a bus or a truck), but would a smaller vehicle make more sense? The more the vehicle weighs, the lower the fuel mileage.
- **Lightweight axle components.** The main axle component that can be lightened up (besides the axles themselves) is the wheel assembly. This can be lightened by using aluminum rims rather than steel, or by switching to a "super single" configuration in place of duals. Super singles have several advantages when it comes to fuel mileage (improved rolling resistance, lighter), but come with the disadvantage that one low tire can stop the vehicle.
- **Fuel capacity.** With fuel weighing over seven pounds a gallon, the more fuel the vehicle carries, the more weight it is carrying. Excessive amounts of fuel (there are truck-tractors built that can carry 400 gallons of fuel) do nothing other than add unnecessary weight to

Vehicle Systems and Specifications

the vehicle. Correct spec'ing normally calls for the vehicle to carry a maximum of one workday's worth of fuel.

Aerodynamics. Air resistance is a vehicle's second greatest impediment to movement, and therefore, optimum fuel economy. Only weight, and the rolling resistance it creates, impacts miles per gallon more. Efficient aerodynamics smooth the flow of air over, under, and around the vehicle. It is not uncommon for some aerodynamic vehicle designs to save carriers as much as 4-5 cents per mile in fuel savings.

When spec'ing trucks for fuel economy, start with the full-cab roof fairing. Make sure it matches the height of your trailers. A proper roof fairing can improve miles per gallon (mpg) performance up to 15 percent when compared to operating without one. Roof fairing considerations include:

- **For raised-roof sleeper cabs.** Most are slightly shorter than a trailer's roof. Therefore, if you have these types of vehicles, you might want to consider adding a small fairing accessory. Without this retrofit, you may lose from 4-10 percent of the benefits of a full roof fairing.
- **For low-height trailers.** Installing a full-height roof fairing on a tractor that hauls primarily low-height trailers (flatbed, tanker) would actually add resistance. For this type of operation, you might be better off with flat-roof or mid-roof fairing that better matches your trailer fleet.

Other aerodynamic/air-deflector options. Most aerodynamic options are equipment packages or after-market add-ons. These include:

- Cab extenders, which are designed to bridge the gap between the truck cab and the trailer. The goal of these extenders is to attempt to reduce the gap to less than 18 inches.
- Side skirts, which cover the fuel tanks and battery box and smooth out the overall profile of the truck.
- Air-dam front bumpers and aerodynamic hoods which are designed to ease air flow around the front of the vehicle.
- Aerodynamic accessories (or aerodynamic location of accessories), such as mirrors, air intakes, air horns, and grab handles.

Notes

Vehicle Maintenance Pro

Notes

- Trailer air deflectors including nose and rear “bubbles,” side skirts, and axle air deflectors. Any of these options can increase fuel economy by 1-3 percent.

Electronic engines. With regard to spec'ing for fuel economy, all new vehicles come with electronically-controlled engines. However, one key issue is what are you, as the vehicle owner, going to be able to do with the electronic engine? Does the manufacturer allow the vehicle owner to reprogram the engine control module (ECM)? Are you able to download data retained in the ECM? Does the ECM only communicate with proprietary software or hardware? If so, can you get the software and/or hardware to reprogram the ECM to improve fuel economy?

Updateable software. If you are using electronic engines (or are going to start using them), another consideration when spec'ing with an eye toward fuel mileage is spec'ing engine control systems that can be updated. Engine manufacturers occasionally update their software, and some of these updates can result in an improvement in fuel mileage. This is a different issue than the “reprogramming” discussed earlier. Updating involves the manufacturer being able to install new operating programs or software into the engine computer, not simply “adjusting the parameters” in the existing software.

Gear fast/Run slow. Gear ratios in the transmission and rear axle(s) determine how fast the engine spins (RPM) at any given road speed. When spec'ing for fuel economy, each must be selected with the other in mind. The best way to use gearing for fuel economy is to “gear fast/run slow.”

Spec your vehicles so that they could run fast, but set the vehicle software to cruise at a slower speed than they are capable of. This lower cruising speed will also mean a lower cruising RPM. The lower the engine RPM during cruising, the less fuel is consumed.

Be careful to not over do it. You are trying to make sure that the engine is operating at the lower end of its power band when cruising, rather than the upper end of the power band. If you gear too fast, the engine will be below its power band when cruising which can create wear and performance problems (the driver or the vehicle has to do a lot of downshifting to maintain speed/power).

Most trucks, tractors, and large buses are geared for a top speed of 75-80 miles per hour (mph) at 1800 to 2100 RPMs. With this engine/gear package they cruise efficiently at 65 mph with the engine operating at between 1300-1500 RPM (when equipped with engines with a power band of 1200 RPMs to 1800 RPMs). At this operating range the vehicle uses the least amount of fuel possible.

Inspection and Maintenance

One key area to focus on when looking to improve fuel mileage is inspection and maintenance. Spec'ing and maintaining go hand in hand. Specific inspection and maintenance items on the vehicles that can have a direct effect on fuel mileage are (these items are also considered when spec'ing vehicles):

Vehicle Systems and Specifications

- Tire type, inflation, and condition,
- Bearing condition,
- Brakes and brake system operation,
- Fuel system protection and integrity,
- Engine oil type, level, and condition, and
- Engine performance.

Notes

Be sure the vehicles are receiving their scheduled maintenance and drivers are performing their daily inspections. Remember, something as simple as an under-inflated tire or a dirty air filter can be lowering the vehicle's fuel mileage.

Driver inspections are critical. If the drivers are not spotting under-inflated tires, bad bearings, dragging brakes, fuel leaks, and oil problems, the vehicle may be losing fuel mileage until it comes in for scheduled maintenance. To avoid this, make sure drivers are trained in inspections and have a program in place that verifies they are doing their inspections.

Be sure the maintenance department is listening to drivers for potential performance problems that may be reducing fuel mileage. If a driver complains of a drop in fuel mileage, or any other performance problem, do a detailed inspection of the vehicle to determine the problem. If the problem becomes common, consider adjusting the spec's on future vehicles.

Vehicle Maintenance Pro

Notes

Summary

Equipment specification is a key area in improving fuel mileage. There are questions the Maintenance Pro should bring to the vehicle manufacturers when spec'ing equipment. Here is a list of considerations in vehicle specification:

- Are the engines properly sized and set for the workload being placed on them?
- Does the engine have a programmable system that allows the Maintenance Pro to set the performance parameters and download performance data?
- Is the transmission and axle gearing keeping the engine in the correct RPM range for maximum fuel mileage?
- Are there intake gauges or warning devices available that can alert the driver or maintenance department of an air intake restriction?
- Are there backpressure monitoring devices available to make sure that the DPF or SCR system is not restricting exhaust flow?
- Are the tires and bearings reducing or increasing rolling resistance?
- Is there a cost-effective tire monitoring system available to keep tires at the proper inflation?
- Are there more effective aerodynamic vehicles or option packages available?
- Is there a vehicle package that can significantly reduce the vehicle weight?
- Does our maintenance match our specifications? In other words, are we maintaining the vehicles in such a way as to increase, rather than decrease, fuel mileage?

Vehicle Maintenance Pro

	Notes
Vehicle Systems and Specifications Emission Systems	
Emission standards The national emission standards are issued by the Environmental Protection Agency (EPA). The actual regulations on heavy-duty engines are included in the regulations portion of this manual. As a Maintenance Pro it will be your responsibility to make sure the vehicles continue to comply with the standards that cover the vehicle. There are two key compliance areas you need to be concerned with. First is the actual emissions standards. The emission standards are issued based on the date of engine manufacture. As an example: If the date of manufacture was previous to 2004, the engine would have to meet the standards that were in place at the time of manufacture (the 1998 standards). The vehicle can be upgraded to a later standard (there are several EPA programs that provide grants or loans for just such a purpose), however, it cannot be allowed to fall below the standards that were in effect on the date of manufacture. It is a violation of federal law to tamper with or remove any emissions components. The vehicle is subject to inspection and testing to verify that it is complying with the emission standards that were in effect at the time of manufacture. If the vehicle has been altered or cannot pass an emissions test due to alteration or lack of proper maintenance, the company can be fined. The second requirement that the Maintenance Pro needs to be concerned with is the emissions labeling requirement. Each vehicle and engine are provided with a label stating which emission standard the vehicle/engine was built under. It is a federal requirement (and a state requirement in many states) that these labels be present on the vehicle. If the label is missing (most commonly a problem with engines) you will need to locate the engine identification number and contact the engine manufacturer for a new label. It may be a good idea to add this to your annual or quarterly PM inspections. As well as the federal emission standards there are state requirements. California is seen as the leader in the emissions area, having tougher standards in some areas than the EPA. Most original equipment manufacturers (OEMs) have been designing their vehicles and engines to meet the California Air Resource Board (CARB) standards, as well as the EPA standards. Overall, the CARB standards for heavy-duty diesel engines are nearly identical for most model years. Key differences between EPA and CARB are the CARB regulations requiring the updating of older diesel-powered vehicles and auxiliary equipment (reefers, unloading pumps, cab heaters, and auxiliary power units) to	

Vehicle Maintenance Pro

Notes

meet the more recent emissions standards. CARB (just like the EPA) requires that all diesel engines meet the emissions standards that were in place at the time of manufacture (no matter the size or intended use). However, CARB is also in the process of requiring the updating of older diesel-powered vehicles and auxiliary units to meet newer particulate matter and NOx emissions standards under various “phase-in” schedules. See the section in this chapter entitled “CARB” for details on CARB’s latest regulatory action in these areas.

Diesel engines used in heavy-duty vehicles are divided into service classes by GVWR. Light heavy-duty diesel engines are engines used in vehicles with a gross vehicle weight rating (GVWR) of 8,500 to 19,500 pounds (14,000 to 19,500 pounds in California; CARB holds vehicles under 14,000 pounds to the same standards as light vehicles) — the exception is personal passenger vehicles with a GVWR of up to 10,000 pounds (these are treated as passenger vehicles in the standards). Medium heavy-duty diesel engines are used in vehicles with a GVWR of 19,500 to 33,000 pounds. Heavy heavy-duty diesel engines (including urban buses) are used in vehicles with a GVWR of 33,000 pounds or more.

We will look only at the heavy-duty engine standards. For model years up to 2003, a simple standards system was used.

1988 to 1998 EPA Emission Standards for Heavy-Duty Diesel Engines, grams per brake horsepower hour (g/bhp/hr)				
Model year	Hydrocarbons (HC)	Carbon Monoxide (CO)	Nitrogen Oxide (NOx)	Particulate Matter (PM)
1988	1.3	15.5	10.7	0.60
1990	1.3	15.5	6.0	0.60
1991	1.3	15.5	5.0	0.25
1994	1.3	15.5	5.0	0.10
1998	1.3	15.5	4.0	0.10

In October 1997, EPA adopted new emission standards for model year 2004 and later heavy-duty diesel truck and bus engines. The goal was to reduce NOx emissions from highway heavy-duty engines to levels approximately 2.0 g/bhp/hr beginning in 2004.

The new regulation also introduced a new method for calculating emissions. Rather than considering hydrocarbons and nitrogen oxide separately, the standards created a combined category of nonmethane hydrocarbons combined with nitrogen oxide (NMHC + NOx). Manufacturers were given the flexibility of meeting one of these two options:

2004 EPA Emission Standards for Heavy-Duty Diesel Engines, grams per brake horsepower hour (g/bhp/hr)		
2004 option	NMHC + NOx	NMHC
1	2.4	n/a
2	2.5	0.5

All other emission standards remained the same (CO and PM) as the 1998 standards.

The next set of standards, passed in 2000, apply to the model years 2007 to 2010. These standards will require a lowering of particulate matter and NOx emissions over this three year span. Here are the standards:

Vehicle Systems and Specifications

2007 to 2010 EPA Emission Standards for Heavy-Duty Diesel Engines, grams per brake horsepower hour (g/bhp/hr)			
Model year	NMHC	NOx	PM
2007	2.5 NMHC + NOx	1.5	0.01
2010	0.14	0.20	0.01

To meet these new standards, OEMs have had to create new technology and emission components (covered below), because simply improving engine electronics and combustion technology cannot meet the new standards. To sum it up, after-treatment of the exhaust has become necessary as of the 2007 standards.

Also, meeting these standards (in particular the new PM standard) required the development of “clean fuels.” This is also covered below.

Diesel particulate filters

As regulations continue to reduce the amount of allowable particulate discharge by a heavy-duty diesel engine, manufacturers have had to develop new technology. One of these new technologies is the diesel particulate filter, or DPF.

The concept of a DPF is not new (they have been around since the 1980s). With the emissions standard changes in 2004 and 2007, OEMs began adapting the technology to on-road heavy diesels.

One point about DPFs — they are not required. What is required is that the particulate discharge be below the regulatory thresholds. To meet these requirements most OEMs have decided to install DPFs.

The principle of a DPF is similar to most filters. The DPF cleans exhaust gas by forcing the gas to flow through the filter which “scrubs out” the particulates. The DPF then oxidizes the trapped particulates, converting them into less harmful components. There are a variety of diesel particulate filter technologies on the market. Several DPFs use a filter material that is also a catalyst that helps reduce other emissions (carbon monoxide and hydrocarbon byproducts).

There are several types of DPFs. Most use a ceramic wallflow honeycomb filter design. This type of filter uses cordierite (a ceramic material that is also used as catalytic converter cores) as the filter medium to trap particulates. These filters also have a honeycomb design to attempt to provide more air flow areas than a standard filter.

Any DPF will be subject to soot and ash build-up. This is normally taken care of through “passive regeneration.” This occurs when the exhaust flow temperature becomes high enough to oxidize the built up particulates. Some systems use “active regeneration,” which increases the exhaust temperature to increase regeneration and improve exhaust flow. All active regeneration systems use extra fuel, whether through burning to heat the DPF, or providing extra power to the DPF’s electrical system.

No matter what regeneration system the vehicle uses, the DPF must still be removed and cleaned or replaced as part of normal PM (manual regeneration if you will).

Notes

Vehicle Maintenance Pro

Notes

How often does this need to be done? That depends on the normal operating temperature of the exhaust, the quality and type of fuel burned, and the age and condition of the engine and air filter. Air filter? Yes! If the engine is not getting the correct amount of air, the engine will not burn fuel as completely, leading to an increase in particulates.

DPFs must be used with ultra-low sulfur diesel fuel (ULSD — 15 parts per million sulfur). Use of regular diesel fuel in a DPF-equipped vehicles could eventually clog the filter. This could lead to exhaust back-pressure increases and engine damage.

One issue with DPFs is the increase in exhaust system temperature. The system must be at an adequate temperature and flow for the DPF to work correctly. Also, slowing the exhaust flow (even slightly) will increase the heat that the exhaust system must absorb. The more restricted the DPF, the higher the temperature is likely to go.

A critical component is a diagnostic module. This will notify the driver if the back-pressure caused by the DPF exceeds an OEM determined threshold.

Exhaust gas recirculation

Exhaust gas recirculation (EGR) is a NO_x emissions reduction technique used in many diesel engines to meet present or upcoming emission standards.

EGR works by recirculating a portion of an engine's exhaust gas back to the engine cylinders, intermixing the incoming air with recirculated exhaust gas dilutes the mix with inert gas, lowering the flame temperature, and (in diesel engines) reducing the amount of excess oxygen. The exhaust gas also increases the specific heat capacity of the mix, lowering the peak combustion temperature.

Because NO_x formation progresses much faster at high temperatures, EGR serves to limit the generation of NO_x. NO_x is primarily formed when a mix of nitrogen and oxygen is subjected to high temperatures. By keeping temperatures lower, the generation of NO_x is reduced.

There are some drawbacks to EGR. Adding EGR to a diesel engine reduces the specific heat ratio of the combustion gases in the power stroke. This reduces the amount of power that can be extracted by the piston and can increase the amount of particulate in the exhaust. If the engine uses EGR, there may be additional capacity requirements pertaining to the DPF.

Another consideration with EGR systems is how they get the exhaust gas into the engine. Modern systems utilizing electronic engine control computers, multiple control inputs, variable geometry turbochargers, and servo-driven EGR valves to accomplish this. These systems will require additional maintenance and must be considered when developing PM schedules.

Vehicle Systems and Specifications

Selective catalytic reduction

Selective catalytic reduction (SCR) is a means of converting nitrogen oxides (NO_x), an unwanted emission from a diesel engine, with the aid of a catalyst into diatomic nitrogen (an inert gas) and water.

To accomplish this, a gaseous reducing agent (urea in the case of on-road diesel engines) is added to the exhaust flow in a materially- and geometrically- controlled environment. The ensuing chemical reaction causes the conversion of NO_x into nitrogen and water, which are then discharged out of the SCR unit with the exhaust flow.

SCR systems do come with some problems, the primary one being the additional maintenance requirements. If the unit is allowed to run out of urea, it will not function. Also, it is another area of the exhaust system that will see additional heat.

Much like the DPF, the SCR unit needs to be removed from the vehicle and cleaned or replaced as part of PM. As with the DPF, there is no magic number as to when this must be done, due to the variables within each operation and the differing conditions that the vehicles and engines can be in.

Another problem is if the SCR system fails, it could create additional back-pressure on the exhaust, leading to a loss in performance and additional heat problems.

All major engine manufacturers in the medium and heavy-duty engine market have gone to SCR to meet the 2010 emission requirements. Most use a combination approach, combining SCR with engine performance adjustments (electronic control adjustments, and air and fuel flow adjustments) and/or EGR to achieve the required NO_x levels. One original equipment manufacturer attempted to meet the requirements on their engines through the use of EGR-only technology (some of their 2010 to 2012 engines did not have SCR). However, all manufacturers are now using SCR to meet the requirements.

The reducing agent that the manufacturers have settled on for on-road diesel engines is urea. As a result, vehicles built with SCR-equipped engines need to be spec'd with a "diesel exhaust fluid," or "DEF" (urea) tank. The size and serviceability of the tank needs to match the carrier operation unless the carrier is willing to purchase DEF on the road at retail prices. Example: An over-the-road vehicle will need a larger DEF tank than one involved in local delivery that receives weekly maintenance. The other consideration is the additional weight that a large DEF tank (when full) will add to the vehicle.

Maintenance Pros need to consider the following in relation to the SCR-equipped vehicles:

- Vehicle specifications involving the DEF tank and SCR unit.
- Inventory levels for SCR replacement parts.
- Inventory levels for DEF.
- Technician training on the DEF systems and SCR units.
- Inspection procedures for the DEF/SCR system.

Notes

Vehicle Maintenance Pro

Notes

- Preventive maintenance items relating to the DEF system and SCR unit.
- Replacement intervals or replacement decision points for SCR units.
- Driver training pertaining to inspecting, filling, and troubleshooting the DEF and SCR systems on the road. An initial decision in this area will need to be made. Do you intend to allow drivers to do anything other than inspect the system?

As more vehicles using the SCR systems come into use in the fleet, these issues may require the Maintenance Pro to revisit the initial inspection, maintenance, and inventory decisions made in relation to the SCR systems.

Clean fuels

Ultra-low sulfur diesel (ULSD) is a diesel fuel with substantially lowered sulfur contents. Traditional diesel fuel contains roughly 500 parts per million (ppm) of sulfur. ULSD contains less than 15 ppm of sulfur.

As of 2006, almost all of the petroleum-based diesel fuel available in North America is of a ULSD type. The move to ULSD is necessary to allow the application of newer emissions control technologies that substantially lower emissions of particulate matter from diesel engines. New emissions standards, dependent on the cleaner fuel, have been in effect in the United States since model year 2007.

On June 1, 2006, refiners were required to produce 80% of their annual output as ULSD, and pumps were required to label diesel fuel, diesel fuel additives, and kerosene pumps with EPA-authorized language disclosing fuel type and sulfur content.

While sulfur is not a lubricant, the process used to refine ULSD reduces the lubricating properties of the fuel. The lubricating characteristics of the fuel lubricates and protects the various parts of the engine's fuel injection system from wear. The processing required to reduce sulfur to 15 ppm also removes naturally-occurring lubricity agents in diesel fuel. To manage this change, ASTM International (formerly the American Society for Testing and Materials) adopted the lubricity specification defined in ASTM D975 for all diesel fuels, and this standard went into effect January 1, 2005. Engine oil manufacturers have also adjusted their products to compensate for the changes in the fuel formulation created by the refining process of ULSD.

CARB

CARB, who are they and what do they do?

CARB (or simply ARB inside California, is the California Air Resources Board) is a unique, non-political agency in California that was created to move air-quality decision out of the political process. CARB regulates everything from power plant emissions to windshield washer fluid. Basically, anything entering the air in California is under their authority.

Vehicle Systems and Specifications

CARB has several programs that have an impact on the transportation industry. Some of these programs only apply to California-based equipment, while others apply to any diesel-powered vehicle operating in California (regardless of where it is registered). This section of the manual includes a listing of the CARB requirements that apply to all vehicles operating in the State of California. Vehicles registered in California have additional requirements (periodic smoke inspection requirements and special regulations on utility, public agency, and trash collection vehicles in California).

While CARB and some of the CARB programs are unique to California and California-based vehicles, many other states have similar rules. It is important that a Maintenance Pro be familiar with any emissions requirements (such as periodic emissions testing) that are in effect in the state where the vehicles are based.

Drayage Trucks emissions

This program applies to all trucks that haul into, out of, or within port and rail facilities in California. This regulation requires the registration of all trucks entering and operating in ports and rail facilities, and establishes emissions reduction requirements that began phasing in as of January 1, 2010 (vehicles can be registered at www.arb.ca.gov/drayagetruck). As of January 1, 2010, class 8 trucks equipped with pre-1994 engines are no longer allowed into the facilities. As of the most recent phase-in, class 7 and 8 trucks equipped with model year 1994 to 2006 engines must meet the 2007 emissions standards (as of January 1, 2014). This involves replacing the engine in the older trucks with a newer engine (2007 or newer) or replacing the truck with a 2007 or newer truck. The final step is all trucks operating in the port and rail facilities meeting the 2010 engine emission standards by January 1, 2023 (2010 and newer engines are fully compliant and will not require any updating).

Emission control label inspection program

This involves all vehicles operating in California. If the vehicle engine is missing its emission control labeling, the owner can be fined.

Heavy-duty diesel vehicle inspection program (HDVIP)

Under this program, any heavy-duty diesel vehicle operating in California can be inspected at any time to make sure it is meeting the emissions standards in place the year the engine was manufactured. Part of the inspection also includes verifying that the emission control system has not been tampered with. Many states have similar roadside emission inspection programs.

Heavy-duty diesel vehicles registered in California are also subject to periodic (regularly scheduled) emissions inspections. This is another emission program that many other states also have in place.

Notes

Vehicle Maintenance Pro

Notes

Idling Reduction Program

Idling of any heavy-duty vehicle is limited to no more than five minutes in California. Also, any heavy-duty vehicle operated in California with a MY 2008 or later engine must have an automatic “shut-down” that turns the engine off after five minutes of idling. There are a few exceptions to this rule (Clean Idle vehicles, operating auxiliary equipment, loading and unloading passengers, etc.). However, idling to control cab temperature while the driver is resting in a sleeper berth is not one of the exceptions (this is one of the common misconceptions).

TRUs

CARB has rules in place that began phasing in as of December 2008 pertaining to Transport Refrigeration Units (TRUs). TRUs are defined as a refrigeration system (a system designed to heat or cool products) that is powered by a diesel engine that is used in the transportation of goods. This definition includes the standard refrigerated units (the diesel engine directly powers the compressor) and generator set (genset) refrigeration units that use a diesel engine to run a generator to provide power to an electric refrigeration unit. Refrigeration systems that do not use a diesel engine for power (are powered off a power unit’s main engine or are powered by “shore power”) are not considered to be TRUs by these regulations.

These rules will require all TRUs to meet the following emission standards:

- Low emission TRU (LETRU): 0.30 g/hr-hp emission if the diesel engine produces less than 25 hp, and .22 g/hr-hp if over 25 hp, or be equipped with an emission system meeting the Level 2 Verified Diesel Emission Control Strategy (VDECS) retrofit standards.
- Ultra low emission TRU (ULETRU): 0.02 g/hr-hp if the diesel engine produces over 25 hp, or be equipped with an emission system meeting the Level 3 VDECS retrofit standards (diesel engine less than 25 hp must meet the Level 3 VDECS retrofit requirements and have no other compliance options).

Here is a breakdown of the specific rules based on the compliance dates:

- August 1, 2009: All owners and operators of California-based TRUs must file with CARB and secure an Air Resource Board Identification Number (ARB IN) by completing an application (for each TRU) that includes owner information, TRU information (year, make, model, identification number, etc.), engine information (year, make, model, horsepower, identification number), compliance status with the performance standards, and how compliance was achieved. Once CARB has assigned the TRU an ARB IN, the company has 30 days to display the number on the TRU. This is the only requirement that out-of-state TRUs do not have to meet (voluntary compliance is allowed for out-of-state TRU owners and operators).
- December 31, 2009: TRUs with an engine from model year (MY) of 2001 or earlier must meet the LETRU requirements.

Vehicle Systems and Specifications

- December 31, 2009: TRUs from MY 2002 must meet the LETRU standards.
- December 31, 2010 (enforcement began March 31, 2011): TRUs with an engine from MY 2003 must meet the LETRU or the ULETRU standards.
- December 31, 2011: TRUs with MY 2004 engines of less than 25 hp must meet the LETRU or ULETRU standards. MY 2004 engines of 25 hp and greater must meet the ULETRU standards.
- December 31, 2012: TRUs with an engine from MY 2005 must meet the ULETRU standards.
- December 31, 2013: TRUs with an engine from MY 2006 must meet the ULETRU standards.
- December 31, 2014: TRUs with an engine from MY 2007 must meet the ULETRU standards.
- December 31, 2015: TRUs with an engine MY of 2001 or earlier must meet the ULETRU requirements.
- December 31, 2015: TRUs with an engine from MY 2008 must meet the ULETRU standards.
- December 31, 2016: TRUs with an engine from MY 2002 must meet the ULETRU standards.
- December 31, 2016: TRUs with an engine from MY 2009 must meet the ULETRU standards.
- December 31, 2017: TRUs with an engine from MY 2010 must meet the ULETRU standards. MY 2003 engines that met the LETRU standards in 2010 must meet the ULETRU standards.
- December 31, 2018: TRUs with an engine from MY 2011 must meet the ULETRU standards. MY 2004 engines of less than 25 hp engines that met the LETRU standards in 2011 must meet the ULETRU standards.
- December 31, 2019: TRUs with an engine from MY 2012 must meet the ULETRU standards.

CARB does account for engine changes. However, all an engine change will do at this time is change the compliance date. Example: If you place a MY 2009 engine into a 2003 TRU, you have changed the compliance date for the TRU from December 31, 2010 to December 31, 2016.

If you cannot justify bringing the TRU into compliance, you do have the option of removing the TRU from service and using the vehicle for the transportation of dry goods. However, the TRU must be completely disabled in such a manner that the engine cannot operate (removal of the engine, removal of the refrigeration unit from the TRU, removal of a significant portion of the engine, etc.). Also, whatever is done to disable the unit must be visually verifiable.

There are several administrative actions pending that may have an impact on the TRU implementation. Carriers that operate TRUs in California

Notes

Vehicle Maintenance Pro

Notes

should plan on meeting the compliance dates. However, be sure to monitor industry news for possible changes in the TRU requirements.

Diesel-fueled auxiliary power systems

Diesel-Fueled Auxiliary Power Systems (also referred to as APUs) use small diesel engines to generate power for cab heating, cab cooling, and operating ancillary appliances. These units can also be used to heat the engine block in cold weather and recharge the vehicle's battery.

A Diesel-Fueled Auxiliary Power System operated on a truck equipped with a 2007 or newer engine must be fitted with a verified Level 3 particulate control device (85% particulate reduction efficiency), or have its exhaust plumbed into the vehicle's exhaust upstream to use the vehicle's particulate matter aftertreatment device (DPF). Also, the Diesel-Fueled Auxiliary Power Systems must be approved by CARB and the vehicle must have an approved "Verified Clean APS" label affixed to the hood of the vehicle.

A list of approved Diesel-Fueled Auxiliary Power Systems is available through the CARB website at: <http://www.arb.ca.gov/msprog/cabcomfort/cabcomfort.htm>.

For trucks with 2006 and earlier model year engines, any California- or federally-certified Internal-Combustion Auxiliary Power System may be used.

Fuel-fired cab heaters

Fuel-Fired Heaters (also know as Fuel Operated Heaters) provide heat to the cab and the engine block, and use only a fraction of the fuel that would be used by idling the vehicle's primary engine. They can be paired with cooling technologies (such as battery-electric, vehicle-battery, or thermal energy storage systems) for a more complete heating and cooling package.

Fuel-Fired Heaters operated on trucks equipped with 2007 and newer engines must meet emission standards specified in California's Low Emission Vehicle Program (as indicated on the unit).

A list of approved Fuel-Fired Heaters is available through the CARB website at: <http://www.arb.ca.gov/msprog/cabcomfort/cabcomfort.htm>.

On trucks equipped with 2006 and earlier model year engines, any Fuel-Fired Heater may be used.

The reason for the regulatory distinction between pre-2007 vehicle engines and 2007 and newer engines in these two areas is CARB wants to see less emission being generated by the auxiliary unit than by the vehicle's main engine. If an older auxiliary unit is placed on a 2007 or newer engine, this may not be the case.

Vehicle Systems and Specifications

Regulation to reduce emissions from in-use on-road diesel vehicles, a.k.a. the “Truck and Bus” rule

In 2008, CARB passed rules requiring that all diesel-powered trucks and buses with a weight rating of 14,000 pounds or more be brought up to the 2010 diesel particulate matter (DPM or simply PM) and Nitrogen Oxide (NO_x) emissions requirements. This will be accomplished by requiring all vehicles built before 2010 to undergo a retrofit. This rule is informally called the Truck and Bus rule or the Private Fleet rule (referring to privately owned vehicles, not private carriers). Much like the TRU rules, the retrofit requirements and schedule will be based on the MY of the vehicle’s engine. The implementation began by requiring vehicles with engines from MY 1996 to 1999 be retrofitted to meet the PM requirements by January 1, 2012, and ends when all covered vehicles with pre-2010 engines are retrofitted to meet the 2010 standards by January 1, 2023. Here is the implementation schedule:

Vehicle/Engine Model-Year	Compliance Deadline, Jan 1...	Requirements
Pre-1994	2015	2010 Engine
1994-1995	2016	2010 Engine
1996-1999	2012 2020	PM BACT 2010 Engine
2000-2004	2013 2021	PM BACT 2010 Engine
2005-2006	2014 2022	PM BACT 2010 Engine
2007-2009	2023	2010 Engine
2010	No requirements	Meets all requirements

*BACT — Best Available Control Technology, a.k.a. Particulate Matter (PM) Filter. “2010 Engine” means that the vehicle must be retrofitted with a 2010 or newer engine by the compliance date shown if it is to stay in service.

There are provisions in the regulation that allow a fleet to phase in compliance based on fleet averaging. This can allow a carrier to keep older equipment on the road if newer equipment is purchased to reduce the fleet’s overall emissions. There are phase-in programs available for small fleets, large fleets, early adopters, school buses, and vocational trucks. There is also a provision that allows “low-mileage” vehicles to operate in California without having been retrofitted.

CARB also allowed carriers with affected vehicles that were not able to get the necessary equipment due to a shortage of approved devices or the inability to secure financing to delay compliance. Carriers that could not secure parts in time had until July 1, 2014, to secure and install the necessary PM filter. Carriers that could not secure financing can delay compliance until January 1, 2017 (for up to three vehicles). To use these exceptions, the carrier must be able to show a “good faith effort” to comply. This includes having documenting that the parts were ordered in a timely manner and/or that the attempt at financing was done in a timely manner (such as in September/October/November 2013). If either of these exceptions are used, the proof of the good faith effort must be retained at the company headquarters and carried in the affected vehicles until the vehicle is retrofitted.

Notes

Vehicle Maintenance Pro

Notes

There is a separate implementation schedule for lighter trucks and buses (with a GVWR of 14,000 to 26,000 pounds) starting in 2015. The basic principle is that once a lighter-duty diesel-powered vehicles's engine reaches 20 years old, it must be replaced with a newer vehicle up to the 2001 and later model years. The 2001 and later model years have a different implementation schedule. To start the program, covered vehicles with a 1995 or older model year engine would have to be replaced by January 1, 2015. Fleets had the option to install a PM filter retrofit by 2014 to make the vehicle exempt from replacement until January 1, 2020.

To use any of the exceptions or phase-in provisions, the company must also have registered with the program using the TRUCRS online registration tool before the applicable deadline.

Details can be found at the CARB website at <http://www.arb.ca.gov/msprog/onrdiesel/onrdiesel.htm>.

Please note: California has adjusted some of the requirements, phase-in schedules, and implementation dates to ease the impact of this rule. What is displayed here is the most recent information (as of September 2014).

Regulation to reduce greenhouse gas emissions

This regulation references a federal voluntary program called the United States Environmental Protection Agency (U.S. EPA) SmartWay Partnership Program. The U.S. EPA SmartWay Partnership Program aims to improve energy efficiency, reduce greenhouse gases (GHG) and air pollutant emissions, and improve energy security of the ground freight movement system by improving fuel mileage (reducing the amount of fuel burned).

Under the SmartWay program, U.S. EPA certifies tractors and trailers that have been demonstrated to be more fuel efficient than their traditional counterparts. At this time, there are SmartWay specifications for tractors with sleeper cabs and for 53-foot or longer dry-van trailers, and therefore, only these products can be certified by original equipment manufacturers under the SmartWay program. The SmartWay program also approves individual aerodynamic equipment for trailers and efficient (low-rolling resistance) tires for tractors and trailers.

The CARB regulation requires new and existing long-haul on-road tractors pulling 53-foot or longer box-type trailers and 53-foot and longer box-type trailers pulled by tractors, which operate on California highways, to be equipped with SmartWay-approved aerodynamic technologies and low-rolling resistance tires (there are no requirements related to buses in this regulation). For purposes of the regulation, a box-type trailer is a dry-van trailer or a refrigerated-van trailer. The regulation does not apply to tractors pulling other types of trailers, e.g., box-type trailers of lengths shorter than 53 feet, or to tractors pulling flatbeds, or logging trailers, drop-frame trailers, curtain-side trailers, or chassis trailers hauling shipping containers. Also exempt from the requirements of the regulation are authorized emergency vehicles and military tactical support vehicles, as well as short-haul and drayage tractors.

Vehicle Systems and Specifications

Beginning January 1, 2010, a 2011 and subsequent model year tractor with a sleeper berth that pulls a 53-foot or longer box-type trailer on a California highway will be required to be a U.S. EPA-certified SmartWay tractor. SmartWay does not currently certify a tractor without a sleeper berth, i.e., day cab, and thus, these tractors would not be required to be SmartWay certified.

In addition, low-rolling resistance tires that meet U.S. EPA SmartWay specifications would be required beginning January 1, 2010, for a 2011 and subsequent model year tractor regardless of whether it has a sleeper berth or not. Beginning January 1, 2013, a 2010 and earlier model year tractor with or without a sleeper berth that pulls a 53-foot or longer box-type trailer on a California highway would be required to be equipped with low-rolling resistance tires. This would be the only retrofit requirement for these tractors.

Tractor compliance date requirements under this CARB requirement

Requirement	Model Year 2011 & Later Tractors with Sleeper Berths	Model Year 2011 & Later Tractors without Sleeper Berths	All Model Year 2010 and Earlier Tractors
SmartWay-Certified Tractor	1/1/2010	Not Applicable	Not Applicable
SmartWay-Approved low-rolling resistance tires	1/1/2010	1/1/2010	1/1/2013

The regulation requires model year 2010 and older tractors, and tractors equipped with 2 or more open-shoulder drive tires to use SmartWay verified low rolling resistance tires by January 1, 2013. However, CARB has clarified that tractors using new non-SmartWay drive tires manufactured before January 1, 2013 (based on the date stamp on the tire) can continue to use those tires for the useful life of that tread, or until January 1, 2015, whichever comes first. Any new drive tire placed on a covered tractor after January 1, 2013, must be a SmartWay verified low rolling resistance tire. Tractors using new non-SmartWay open-shoulder drive tires manufactured before January 1, 2013, can continue to use those tires for the useful life of that tread, or until January 1, 2015, whichever comes first. Any new open-shoulder drive tire manufactured after January 1, 2013, and installed on a covered vehicle must be a SmartWay verified low rolling resistance tire. Non-SmartWay open-shoulder retreaded tires manufactured prior to January 1, 2014, may continue to be used for the useful life of that tread, or until January 1, 2016, whichever comes first. Any open-shoulder retreaded drive tire retreaded after January 1, 2014, must be capped with a SmartWay verified low rolling resistance retread material on any casing.

For trailers subject to the regulation, there are two different implementation schedules based on the model year (MY). MY 2011 and newer 53-foot or longer box-type trailers must be either SmartWay certified or retrofitted with SmartWay verified technologies (low rolling resistance tires and aerodynamic technologies), as of January 1, 2010.

The older trailers (MY 2010 and older, with the exception of certain MY 2003 to 2009 refrigerated-van trailers which are addressed separately)

Notes

Vehicle Maintenance Pro

Notes

must meet the same aerodynamic technology requirements as the MY 2011 and newer trailers either by January 1, 2013 or according to a compliance schedule based on fleet size which allows a phase-in over time.

MY 2010 and older trailers must also use SmartWay verified low rolling resistance tires by January 1, 2017. The MY 2003 to 2009 refrigerated trailers equipped with 2003 or newer MY transport refrigeration units have a compliance phase-in between 2017 and 2019.

53' trailer compliance options under this CARB requirement, beginning January 1, 2010

Trailer Type	Purchase Certified SmartWay Trailer	Retrofitted with SmartWay-approved low rolling resistance tires and SmartWay-approved aerodynamic devices	Retrofitted with SmartWay-approved low-rolling resistance tires and aerodynamic devices demonstrated to meet min. fuel savings per SmartWay Program
Dry-Van	Available	Aero = side skirts + rear or front fairing	Aero must provide 5% fuel savings
Refrigerated-Van	Not available on new trailers at this time	Aero = side skirts	Aero must provide 4% fuel savings

How the low rolling resistance tire requirements of the regulation will be implemented when it comes to older tractors and trailers, and vehicles using recaps, has been addressed by CARB.

Model year 2011 and newer tractors and trailers using retreaded tires comprised of a SmartWay casing capped with any retread material prior to January 1, 2013, can continue to use those tires for the useful life of the tread or until January 1, 2015, for tractors and January 1, 2017, for trailers, whichever comes first. Any tire retreaded after January 1, 2013, must be capped with a SmartWay verified low rolling resistance retread material on any casing.

These regulations do provide an implementation schedule for trailers built before January 1, 2010, with additional time provided for small carriers to comply, and a few exceptions (see below). Full details on the small fleet and general exceptions are available at the CARB website at <http://www.arb.ca.gov/cc/hdghg/hdghg.htm>.

Exempt from this regulation are:

- Custom extended sleeper cab tractors
- Curtain side vans
- Container chassis
- Drayage tractors and trailers that operate within a 100 mile radius of a port or intermodal rail yard
- Solid waste vehicles

There are also exceptions for emergency and military vehicles.

Vehicle Systems and Specifications

What kinds of equipment will meet the requirements of this regulation? To comply with the regulation, you may purchase a SmartWay certified tractor and/or trailer, which will come equipped with the approved technologies. You may also comply by retrofitting your trailer with approved low rolling resistance tires and one or more of the following aerodynamic technologies:

- Trailer rear fairings
- Trailer front gap fairings
- Trailer side skirts
- Other SmartWay approved technologies

The type or number of technologies required will be based on the percentage of greenhouse gas emissions reduction of each device. These required percentages can be found in the regulation at: www.arb.ca.gov/regact/2008/ghghdv08/ghghdv08.htm.

Some carriers have chosen to disregard this regulation and operate non-compliant vehicles in California and have not received fines. However, this is changing. CARB has received final approval from EPA and can now start on- and off-road (auditing) enforcement related to this rule.

On-board diagnostics

On September 8, 2008, the U.S. EPA granted the CARB waiver request related to on-board emissions diagnostics. Under this CARB rule, all heavy-duty vehicles operating in California built in MY 2010 or later must have an on-board diagnostic system that notifies the driver if the emissions system is not functioning correctly. The diagnostic system must monitor all vehicle systems and components that can effect emissions, such as fuel, catalytic converter, turbocharger, exhaust gas recirculation, particulate matter filter, cooling, and valve timing.

If a malfunction is detected by the system, the diagnostic system must immediately report the malfunction to the driver (via a dash display). The rule requires that the driver be notified as soon as any component involved in the emissions system malfunctions, not when the emissions exceed the regulatory limits. This regulation matches an existing regulations pertaining to light-duty vehicles.

There was initial objection to this rule in the OEM and transportation industries, based on having to design and install such a system to satisfy one state. However, that argument was put to rest when the U.S. EPA enacted a regulation similar to the CARB rule. Under the U.S. EPA rule heavy-duty engine manufacturers must begin building engines that have an emissions diagnostic system starting in MY 2010, and all heavy-duty diesel engines built from MY 2013 on must be equipped with a diagnostic system.

Idle reduction laws

In an attempt to lower emissions being generated by on-road diesel engines, many states have enacted idle reduction laws. These laws limit the amount of time the main engine on a vehicle can be idled when the vehicle is parked. Vehicles equipped with APUs, gen-sets, and other idle or emission reduction systems are allowed to use these systems and still be considered in compliance.

Here are the states that have idling laws and a brief explanation of their laws:

- Arizona does not have a statewide law, but does have a law that requires counties above a specified population to have an idle reduction law. As a result, only Maricopa County limits idling (see below).
- California allows five minutes of idling unless the vehicle is marked with a California Clean Idle label.
- Connecticut allows an engine to be idled for three minutes unless the temperature is below 20 degrees.
- Delaware allows an engine to be idled for three minutes if the temperature is above freezing and for 15 minutes if the temperature is between minus 10 and 32 degrees. If the temperature goes below minus 10 degrees there is no limit on idling.
- District of Columbia allows three minutes of idling, unless the temperature falls below 32 degrees, then the engine may be idled up to five minutes.
- Florida allows 5 minutes of idling. The limit includes various exemptions, including when a driver is sleeping or resting in a sleeper berth (this exception is set to expire Sept. 30, 2013).
- Hawaii allows up to three minutes of idling to warm up or cool down the engine only.
- Illinois does not allow the idling of unattended vehicles under any circumstances. Illinois also has a state law regulating idling in the counties of Cook, DuPage, Lake, Kane, McHenry, Will, Madison, St. Clair, and Monroe, and the townships of Aux Sable and Goose Lake in Grundy County and the township of Oswego in Kendall County. In these counties and townships idling is allowed for 10 minutes of any 60 minute period. There are exceptions if it is necessary for the driver's rest when in the sleeper berth or if the temperature is under 32 degrees or over 80 degrees.
- Maine allows 5 minutes of idling in any one-hour period. There is no limit If the temperature goes below 0 degrees. The law includes various exemptions, including sleeper berth heating or cooling during rest or sleep periods.
- Maryland allows up to five minutes of idling.
- Massachusetts also allows up to five minutes of idling.
- Missouri allows up to five minutes of idling in any hour (30 minutes/hour when waiting to load/unload) in the following counties: Clay,

Vehicle Systems and Specifications

Franklin, Jackson, Jefferson, Platte, and St. Charles. St. Louis County is restricted to three minutes of idling.

- Nevada allows up to 15 minutes of idling.
- New Hampshire allows five minutes of idling if the temperature is over 32 degrees and 15 minutes if the temperature is between minus 10 and 32 degrees. If the temperature goes below minus 10 degrees there is no limit on idling.
- New Jersey allows three minutes of idling if the temperature is above 25 degrees. If the temperature goes below 25 degrees the engine may be idled for 15 minutes if the vehicle is parked for over three hours. New Jersey does allow idling if the driver is in the sleeper berth resting, and the truck is equipped with a MY 2007 or newer engine, or if the truck has been retrofitted with a diesel particulate filter.
- New York allows five minutes of idling if the temperature is above 25 degrees. If the temperature goes below 25 degrees the engine may be idled if the vehicle is parked for over two hours.
- North Carolina allows five minutes of idling in any one hour period. Idling by vehicles marked with a California Clean Idle label is allowed.
- Oregon allows five minutes of idling in any 60 minute period. This extends to 30 minutes of idling in any 60 minute period if the vehicle is waiting to load or unload, or is loading or unloading. Oregon also allows idling if the driver is resting in the vehicle and the temperature is under 50 degrees or over 75 degrees.
- Pennsylvania allows five minutes in any 1 hour period. Idling by vehicles marked with a California Clean Idle label is allowed.
- Rhode Island allows five minutes of idling each hour if the temperature is above 32 degrees. If the temperature is between zero and 32 degrees the limit increases to 15 minutes per hour. When the temperature is below zero there is no limit on idling.
- South Carolina allows 10 minutes of idling. The law includes various exemptions, including sleeper berth heating or cooling during rest or sleep periods if the temperature is below 40 degrees or above 80 degrees, and the truck is at a rest area, terminal, or truck stop.
- Texas State Codes apply to only the following counties: Bastrop, Caldwell, Collin, Dallas, Hays, Kaufman, Tarrant, Travis, and Williamson and the following cities and towns: Arlington, Austin, Bastrop, Benbrook, Cedar Hill, Celina, Colleyville, Dallas, Duncanville, Elgin, Euless, Fort Worth, Georgetown, Hurst, Hutto, Keene, Lake Worth, Lancaster, Little Elm, Lockhart, Luling, Mabank, McKinney, Mesquite, North Richland Hills, Pecan Hill, Richardson, Round Rock, Rowlett, San Marcos, University Park, Venus, and Westlake. The Texas State Codes in effect in these municipalities allows for a maximum of five minutes of idling.
- Utah does not allow an unattended vehicle to be left idling.

Notes

Vehicle Maintenance Pro

Notes

- Virginia limits idling to 10 minutes in commercial and residential areas.
- West Virginia allows 15 minutes of idling in any 60-minute period. Idling by vehicles marked with a California Clean Idle label and vehicles powered by alternate clean fuels is allowed.

As well as states having laws that prohibit or limit idling, many municipalities also have laws prohibiting or limiting idling. Some of these municipalities are in states that have idling restrictions. The difference is that the local law in these states is usually more stringent than the state requirements (the local law does not grant exceptions or uses a stricter time limit). Here is a list of municipalities that have restrictions on idling organized by state:

- Arizona: Maricopa County.
- California: Auburn, Cupertino, Fountain Valley, Palm Desert, Placer County, and Sacramento.
- Colorado: Aspen, Denver (city and county), Greenwood, Johnstown, Vail, and Winter Park.
- Connecticut: Branford, Mansfield, Norwalk, and Winsor.
- Delaware: Wilmington.
- Georgia: Atlanta.
- Illinois: Cook County (Chicago) and East St. Louis.
- Louisiana: New Orleans.
- Maine: Bar Harbor.
- Massachusetts: Cambridge, Chicopee, and Peabody.
- Michigan: Detroit.
- Minnesota: Minneapolis, Owatonna, and St. Cloud.
- Missouri: City and County of St. Louis.
- Nevada: Clark and Washoe Counties.
- New Jersey: Atlantic City, Bernards, Cape May, Closter, Franklin, Hillsdale, Princeton, and South River.
- New York: Brighton, Bronxville, Clifton Park, Flower Hill, Ithaca, Lawrence, Mamaroneck, Milton, New Rochelle, New York City, North Salem, Northport, Nyack, Port Chester, Queensbury, Rockland, Rye, Scarsdale, Somers, Suffolk County, Tuckahoe, and Yonkers.
- Ohio: Waynesville (only applies to buses).
- Oregon: Ashland.
- Pennsylvania: Alleghany County, Emsworth, Falls, Philadelphia, and Upper Providence.
- Rhode Island: Providence.
- South Carolina: Beaufort and Charleston.

Vehicle Systems and Specifications

- Utah: Cities of Park City and Salt Lake City, and Salt Lake County.
- Vermont: Burlington.
- Virginia: Arlington and Fairfax Counties.
- Washington: Spokane.
- Wisconsin: Madison.
- Wyoming: Rawlins.

Tire Management

Introduction

Tire Management is something a successful Maintenance Pro must be doing to keep tire costs in check. Management means control. You should be able to account for every tire purchased. From the time the tire is purchased, through rotation and recap, to the final destination, to the scrap heap. Are you able to track a single fleet tire accurately? Do you know how much your tires are costing the fleet? Do you compensate back if you receive warranty payment for a failed tire (much like parts)?

This tire chapter starts out by reviewing some purchasing considerations to think about. Tire inspections — who, what, where, and why, open up the first area of control. The second section is a familiar one: recordkeeping. If you think your vehicle recordkeeping isn't adequately detailed, tire records can make the situation even more interesting. Finally, we'll look at ways to extend tire life, from good driver technique to retreading.

Tire costs make up the second highest vehicle operating cost item (next to fuel) in heavier-duty trucking applications today (not counting the driver). It is similar in passenger operations. Failure to manage fleet tires properly can lead to doubling or even tripling that cost. Like all maintenance efforts, good tire management only comes from the combined efforts of every person coming into contact with the tire. Standardized inspection and maintenance procedures will keep your tire program running smoothly and efficiently; good records identify trends so that you can act to correct them. That's the game:

- smart buying
- good maintenance (by both drivers and the shop), and
- complete records.

The final step in any tire management program is failure analysis. This, when combined with recordkeeping, gives you insight into whether your program is working or not working.

Tire management won't work without all four of these elements being properly in place.

Purchasing considerations

As operations seek to reduce costs, they look to better fuel economy for their vehicles as the answer. In addition to engine and aerodynamic improvements, the increased use of radial tires today has contributed greatly to truck efficiency — but tire technology has also brought about lower overall tire costs. In the old days a 2¢ per mile cost was considered to be an excellent tire cost figure for a five-axle combination unit. Thanks to today's improved design and longer tire life, many Maintenance Pros are shooting for 1/10¢ (one mil) per mile and getting it. But not without a

Vehicle Maintenance Pro

Notes

little work. Retreading plays a major role in their plans and only careful inspection and maintenance provide retread potential. Since good tire practices and retreading potential starts with the initial tire purchase, let's review some tire basics.

Tire size and load

As you know, tire specifications start with weight: the maximum load that the tire will have to carry. Other concerns are whether the tire will be positioned as a single or part of a dual assembly and how fast the unit will travel. Tire manufacturers have charts to determine the proper size with load and inflation data at normal highway speeds. At higher speeds the load per tire must be reduced to avoid temperature buildup. Single tire ratings are usually used for selection purposes because new tires are commonly used in the steering axle positions and they carry more load per tire there. So the steering axle tire size establishes the size for drive axle and trailer as well.

The largest size tire that the vehicle can accommodate is usually recommended. The lower inflation pressure of the larger tire reduces wheel rim stresses and adds more mileage to the tread life because of the reduced number of revolutions per mile. A larger tire size also means that the tire is probably operating well below its rated capacity so it will be in better condition for a recap when the tread is worn down. The tire which is seldom overloaded gives the best service.

Another consideration in tire selection is the California Air Resources Board (CARB) regulation requiring 53 foot box-type trailers and the power units pulling them to be equipped with low rolling resistance tires when operating in California. If the vehicle is covered by this regulation, you will need to verify that the tires being purchased meet the EPA SmartWay low rolling resistance standards (see the CARB section in the Emission Systems chapter of this manual for details on this rule).

Rims and wheels

The tire may meet the road, but it's mounted on the wheel and it's the wheel that supports the weight. Vehicle specs always include wheels, rims, and tires as a total assembly. There are two types of wheels commonly used: cast spoke and disc.

Cast-spoke wheels (also known as "Dayton wheels")

The cast-spoke wheel design incorporates cast spokes which are attached to the hub. The rim is then slid onto the spokes and clamped into position with compression wedges. This configuration is used in medium and heavy vehicles, and has the advantage of being extremely durable; however, wheel balance and tire alignment are trickier to achieve because the tire and rim adjustment is more complex, and the entire assembly (spokes and rim) is heavier than the disc wheels.

Disc wheels (also known as "Budd wheels")

In the disc arrangement, the entire wheel and tire assembly is secured by the wheel studs (six to ten-hole models), so wheel alignment is easier.

Vehicle Systems and Specifications

Disc wheels are lighter than the spoke wheel assemblies. This is especially true if the rim is made of an aluminum alloy. Disc wheels also have less wobble, the side-to-side movement of the rotating wheel/tire assembly as it goes down the road, when compared to the spoke wheels.

In a disc-type wheel, the rim (the outside portion on which the tire is mounted) is permanently joined to the disc, so the rim can't slip. Since the conventional disc wheel is in one piece, it runs truer and is easier to balance; however, the disc wheel configurations require frequent retorquing. If the lug nuts are allowed to loosen, the rim may crack, leading to the rim separating from the vehicle.

There are two types of disc wheels: conventional disc wheels and piloted disc wheels. Installation of the conventional disc wheels in the dual-wheel application requires sliding the inner wheel over the studs, threading on and tightening the inner lug nuts (which are also the outer wheel's studs), then sliding the outer wheel over the inner nuts' studs, and threading and tightening the outer nuts. To remove, take the steps in reverse. Rather a lengthy job for mechanics, with many opportunities for errors, so it's not surprising that new wheel designs featuring hub piloting and single-nut fastening are getting the nod from maintenance-conscious fleet personnel.

Hub-piloted discs (also known as piloted Budd wheels)

The hub-piloted disc is an increasingly popular alternative to the traditional spoke and disc configurations, and conventional disc wheels. Unlike conventional disc wheels, this one is centered by the hub, not by the studs, and is attached by flat-faced holes and flanged nuts. There are big advantages to this system. Hub-piloted discs are easier to install, requiring only one lug nut per stud, and run as true and well-balanced as conventional disc wheels.

Notes

Vehicle Maintenance Pro

Notes

Whatever rim is used, it must be compatible with the tire selected. Rim widths are approved for a given tire size, whether radial or bias ply.

There's a big difference between the demands made by a linehaul unit and a city delivery truck, just as there is a big difference in the tire demands placed on a school bus versus an over-the-road coach. Whether a tire is mounted on a steering, drive, or dead axle requires different tire tread characteristics. Tire rubber composition must be considered as well. So if you're interested in the best fuel economy, you'll be looking for solutions that decrease rolling resistance —the greatest threat to tire/fuel economy. If you are looking for durability in a tough service environment, you are going to want tires made of a tougher material/construction.

Types of tires

Two major types of tires are available to the industry today. The difference in bias-ply and radial tire construction is the angle of body plies and the presence of belts.

Bias-ply vs. Radial

In bias-ply, the fabric plies are wrapped diagonally and there are no belts. This construction offers a tough tire at a cheap price, but unfortunately has the shortest life. Bias-belted tires, less expensive than radials, are a compromise: belts are strapped around the circumference for additional strength. Radial tires, the most expensive variety, feature a design where the plies are wound radially across the width of the tire carcass, i.e., the cords run at a 90 degree angle to the tread centerline. A steel-belted radial has a steel belt system sandwiched between the ply and the tread rubber.

One of the biggest advantages of radial tires is improved fuel mileage. Most fleets that are running equipment on the road have switched to radial tires for this reason. Bias tires, which are more durable and cheaper than radial tires (but do not get anywhere near the same fuel economy), are primarily used in extreme and off-road applications.

Radial tires give the best value in many applications, especially for the long haul. Today's models last twice as long as those offered just a few years ago. Radials are a major contributor to fuel economy in linehaul operations because they reduce rolling resistance, which can account for up to 20 percent of a vehicle's fuel consumption. In fact, the greater the GVW, the better the fuel savings are with radials. The radial ply and steel cord belts give strength and stability. Some other advantages are:

- Better retreadability.
- Resistance to puncture.
- Higher load ratings.
- Improved road handling.
- Quieter running.
- Cooler running.
- Longer tread life.

Vehicle Systems and Specifications

- More flexible casing yields a better ride.

The radial casing is worth three to four times as much as a bias-ply. It deserves good care. Even when it may no longer stand up to linehaul duty, you might get another two or three years of service in the city.

Low-profile radials

Low aspect-ratio radial tires, or low-profile tires, are gaining in popularity. Aspect-ratio refers to the relationship between the tire's section height (the distance from bead to tread), and its section width (the distance between the widest points of the inflated sidewall). Standard radials are about $\frac{9}{10}$ as high as they are wide, for an aspect ratio of 90. Low-profile radials run around 70 or 80, with the 70-series being even more squat in appearance. It stands nearly four inches shorter than the 80-series and five inches shorter than a standard. The shorter height makes the 70-series a popular choice for high-cube semi-trailers and other vehicles where height can be an issue.

Low-profile radials have all the advantages of standard radials, but offer some additional pluses:

- They weigh less, so you pay less federal excise tax on new tires.
- Their lower height means the user can operate a higher-profile vehicle (such as a high-cube trailer).
- Lower height may also help with the occasional overhead clearance problem (such as low bridges, signs, tree branches, etc.).
- Lower center of gravity contributes to better cornering stability and a safer ride.
- Shorter sidewalls yield more responsive steering capability when compared with standard radials.
- A more rigid belt package reduces flexing in the tread, which increases original tread miles and makes the tire a good retreading candidate down the road.
- Due to all these factors, the overall stability of the vehicle is improved.

Before you run out and purchase low-profile tires, however, keep in mind that some fleet tire habits may have to be changed. Smaller tires must be protected from overloading conditions. Changing a fleet's standard tire may mean changing speedometers or rear-axle gearing. If you go from 11R24.5 tires to the same low-profiles, the vehicle will be slowed down 2.8 mph at the same engine rpm if no changes are made. You may need assistance in comparing the different sizes and designations offered by the manufacturers. Diameter, loaded radius, and tire revolutions per mile are the data upon which to base comparisons. Special designs are available for steering axles and dead axle applications, like trailers, converter dollies, and tags. So if you're thinking about low-profiles in the future, order today's new equipment with 8.25 rims for convenient change-over later.

Notes

Notes

Wide-base singles

As long as we are looking at weight reduction, the latest concept in lighter tires is the wide-base single or super-single. While you probably wouldn't realize any savings in the federal excise tax on a super-single (the tax is likely to be more), the possibility of exchanging a set of duals for one tire is an attractive idea for the fleet wishing to cut down on tire costs. And the big dual assemblies that we're used to in the U.S. pay a heavy price in rolling resistance (and therefore in fuel economy).

The biggest drawback in acceptance of the super-single is naturally the fear of a flat tire. Some operators may never be able to overcome this concern. In Europe, 30% of all tri-axles run singles. Yet, when the tires were introduced in the U.S. in the past, they were put into service conditions that are typical of line haul operations here: long distance, high speed, high torque, and high temperature. Today, though, improvements to the tire carcass have reduced the possibility of tire failure, and many tire experts believe that the super-single will see wide acceptance in the future.

Another concern with the super-single tires is wheel bearing wear. The super-singles may cause the wheel bearings to wear differently or more quickly in some cases (depending on many factors) due to the change in the way the hub carries its load. The change is caused by the change in the center of the tire area versus the center of the hub/wheel bearing relationship. Axle manufacturers and OEMs are presently looking at this and are trying to quantify the issue and develop best practices or design changes to eliminate any problems.

If you are considering switching a vehicle that presently has dual wheels to the super-single configuration, please consult with the vehicle OEM before beginning the conversion to determine if any additional modifications or maintenance considerations may be necessary (such as increasing wheel bearing inspections).

Super-singles will require drivers to pay closer attention to inflation. While they might be able to ignore a low tire in duals, singles will need to be checked carefully as part of every pre-trip inspection. Keep in mind, though, that it's a lot easier to approach a super-single than it is your standard dual assembly or even your standard radial. This makes required inspections much less of a headache than might be expected. Still, replacement tires aren't as easy to come by around the country as yet, so if you plan on taking advantage of the benefits of a super-single assembly, be certain to make sure that they are readily available in your area. Another plus: you won't have to worry as much about theft. It's impossible for a thief to take off with one of the tires!

In addition to the weight advantages, the super-single has other attractions when compared to standard wide-base tires:

- Greater lateral rigidity provides improved handling.
- Greater radial rigidity provides improved ride.
- Longer casing life means improved retreadability.
- Reduced weight means increased load capacity.

Vehicle Systems and Specifications

The advantages over the standard radial tire include (in addition to the initial price as compared to duals and the weight savings):

- more fuel savings,
- greater lateral rigidity for more improved handling,
- increased exposure to cooling air for brakes and tires,
- better tire pressure maintenance because valve stems are easier to get at, and
- fewer tire/wheel assemblies for less maintenance.

Tread design

The basic types of highway tire tread designs are rib, lug, and special service (high traction, off-road).

With a groove design that goes around the circumference of the tire, rib tires are classified as “all position” tires. The open-groove tread offers good skid resistance and steering capabilities, so it works well on the steering axle. A five-rib design generally has less rolling resistance than a two- or three-rib tire.

Lug or cross-rib tires are designed for drive axles and are used for most over-the-road operations. The tread design has maximum resistance to wear and good traction. When placed on the drive axle, they normally deliver more mileage than rib tires. Although suitable for some off-road operations, they do not offer maximum traction as the special service tread designs. New tires designed specifically for trailers or tag axles usually feature a modified rib-lug pattern. The deeper the tread, the more rolling resistance. You’ll want to be sure you need the extra traction to make up for some loss in fuel economy.

Consider your transportation needs

When selecting tread designs, keep in mind that no one design will meet all your transportation needs. All driving applications, from interstate operations to urban deliveries, have their own built-in challenges and demands, and when purchasing tires it’s important to select the tread design that will be best for you and your application. Finding the right type of tread will help you improve your fuel efficiency and will also extend the lifespan of your tires, reducing costs due to maintenance, retreading, and purchasing. To find the right tread, start by considering your applications.

Linehaul operations

Linehaul operations involve long hauls on interstate highways with nothing more than gentle curves and grades. Although it is important for linehaul drivers to have good traction over a variety of road conditions, it’s also a good idea to avoid the more aggressive treads, which make for an inefficient ride when on linehauls. Smoother-tread tires, such as standard closed-rib highway-tread radials, will allow for greater fuel economy than all-weather tread patterns.

Notes

Vehicle Maintenance Pro

Notes

Linehaul drivers should also take measures to avoid irregular wear to their tires, a major contributor to premature tire breakdown. To reduce irregular wear, select a tire with side grooves. These add flexibility and help the sidewalls absorb irregularities in roads. Equalizer ribs also help distribute pressure across the main tread ribs, further reducing irregular wear.

Regional operations

For operations that don't deal exclusively in interstate transportation, a new set of concerns arises. Regional runs require drivers to travel on small highways with rough surfaces and aggressive curves, and may also entail making deliveries in cities. In these situations, it is important to have a fair amount of protection built into your tires to resist the effects of road abrasion and sidewalk and curb scrubbing. A reinforced shoulder and sidewall area will help protect your tires against these kinds of threats.

On/Off road

Trucks making frequent off-road deliveries will need to be equipped with tires that are resistant to cuts and drilling from stone chips, jagged rocks, and other off-road debris. Your belts and casings will also encounter a great deal of stress, so look for extra protection in the belt construction and tread thickness. If your trucks are running almost exclusively off-road, you'll want to consider tread depths up to $\frac{40}{32}$ nds.

Use specialized treads

Tire manufacturers have developed a wide variety of specialized tread designs tailored to meet the demands of each of your rigs' axles. By helping to minimize the strains and stresses unique to the different axles, the specialized treads allow your tires to do their job more effectively than ever, allowing for minimal wear and preventing premature retreads.

Steer tires

Steer tires will almost always require rib designs in order to resist irregular wear. Because steer tires must take on the immense burden of controlling the directional forces created by the driving tires, they too often succumb to cupping, a form of irregular wear resulting from the erosion of the shoulders. To help combat cupping, select tires specially designed with features such as equalizer ribs and defense grooves. These help protect your shoulders and can extend your steer tire life.

Drive tires

Although drive tires are not as susceptible to wear as steer tires, irregular wear is still an important consideration when purchasing tires for this position. Due to the strain of providing the driving torque that propels the vehicle forward, drive tires are subject to heel/toe wear and the more serious high/low lug wear. To beat these types of wear, you'll need to take one of two approaches. In applications that cause moderate-to-fast wear (wear rates of about 10,000 miles per $\frac{1}{32}$ -inch of tread wear or less, and removal mileage less than 225,000 miles), use open shoulder rib or

Vehicle Systems and Specifications

lug tires. With more substantial wear (12,000 miles per $\frac{1}{32}$ -inch of tread wear or more, and removal mileage greater than 275,000 miles), select closed shoulder drive tires.

Trailer tires

Trailer tires have a big effect on fuel economy, so in order to be as fuel-efficient as possible it's important to find the right tires for this position. Look for tires with shallow treads that offer as little rolling resistance as possible, but don't forget about the threats posed by irregular wear.

On the other hand, if your tractor has spread axles, you'll want to select tires with deeper tread designs and strong shoulders and sidewalls to help guard against the scrubbing that occurs while turning.

Tube vs. Tubeless

Tubeless tires are generally preferred today, especially for linehaul operations. The ease of service and the use of fewer parts leads to fewer road delays. They also save weight (there are fewer component parts) and eliminate tube, flap, and ring problems. So if you're going to radials, specify tubeless tires.

A final word of advice about tire purchase is to know your dealer. Choosing the right dealer is extremely important if you wish to lower tire costs. Don't hesitate to shop around at a time when you aren't in a pinch for tires. The dealer will sense that you're under pressure and may not offer the best price. Find out the best time to buy and see what kind of deal you can arrange. Use past experience as a guide. Ask for test results if you are considering a new model. If the tire is a new design, find out how available they are in the geographical area where you operate. Inquire whether you might be able to test a new model before making a commitment to purchase more tires. Cold weather slows down the wear rate and tires that roll off the first $\frac{4}{32}$ inch in winter will have up to 15% more tread life.

How about field services? The small fleet maintenance shop is much less likely to have its own tire man. So if you have had more than your share of downtime because of tire problems, ask whether some recordkeeping, inventory, and other services might be offered by the tire dealer. Be sure that your dealer will take enough time to look at the total operation and help you select the right tires for your fleet. Then ask for a fair price and a warranty on the tires you buy. Find out how much help he will be when it's time to buy new equipment. He should not only be able to give you the latest information, but he might also be willing to give you a special deal if his manufacturer's tires are specified on any new equipment.

A final point to think about is purchasing directly from the tire company. Is your operation large enough? Do you have experienced personnel? Can you manage with no service at all and drop-off tires?

Maintenance

Inspections

Good tire maintenance begins with regular inspections by the driver and the shop every time the vehicle is brought in for a PM inspection/service (or every time it goes through the inspection lane). Inspections can be divided into several parts: visual inspection of tire and rim, checking inflation, checking for matching on duals, and checking for mismatching of tire types (radials and bias-plys). A shop PM inspection would include all the above and add some additional checks, such as measuring tread depth prior to rotation, and checking vehicle and axle alignment.

Visual inspection

When performing the tire inspection the following should be checked first:

- Rims for bends, cracks, or bad lug holes.
- Wheels for broken studs and nuts; cap nut looseness (rust streaks); and oil/grease seals for leaks.
- Tires treads for any kind of foreign object embedded in the tread surface; check for puncturing objects; look for cuts, cracks, or separations.
- Tire sidewalls for bumps or bulges, tears, or cracks.
- Valve stems for caps and position (180 degrees apart on duals and clear of any wheel spokes).
- Tire pressure.
- For overheating by feeling the sidewall (during and after trip).

Inflation check

Maintaining correct tire pressures can reduce tire costs by up to 20 percent; incorrect tire pressures can only lead to tire problems. Underinflation is the major cause of tire failure; the increased flexing of the tire in motion causes excessive heating up of the tire components. It reduces the strength of the tire and leads to breakdown of the rubber compounds. The tire can separate or even catch fire from the extreme heat. Low inflation increases the rolling resistance of radial tires, which means higher fuel costs and less tread life. Tread separation, bruises, breaks, and blowouts can result.

Overinflation is less likely to happen, but it can cause tire damage, too. An overinflated tire is more rigid and so does not absorb road shocks as well, a problem that may cause serious damage to treads as the tire bounces and skids along the road. Overinflation also decreases the tire foot print. Only the center portion of the tread is in firm contact with the ground, rather than the entire width. The reduction in footprint will cause an extreme center wear pattern. Higher pressures can also over-stress the rim, causing rim damage. Finally, an overinflated tire is more prone to puncture or cuts from road debris.

Vehicle Systems and Specifications

Air pressure checks

Air pressure should be checked and corrected when the tires are cold. If it is absolutely necessary to check hot tires, 15 percent should be added to the standard cold pressure. Drivers, who may not be familiar with such issues, should be told that air pressure in hot tires is never to be reduced.

Ideally, tires on vehicles just off the road should be allowed to cool for a couple of hours before pressures are checked. The tire gauges used to check pressures must themselves be checked frequently to make sure that they are accurate. If they are off by more than 5 psi, they should be replaced or repaired.

Take care to check the air pressure in all tires. Do not neglect the inside duals, which are frequently skipped because of their inaccessibility. To ensure that you're getting optimal fuel efficiency as well as your money's worth out of your tires, check all of them consistently.

The time interval for inflation checks should be established by you. Manufacturers recommend testing daily, at least once a week, or before the first run of the day, depending on the application. If you prefer more frequent checks, it is a good idea to use metal valve stem caps on the valve stems.

Drivers may need to be trained to make proper inflation checks, if the vehicles are not in the yard often enough. Drivers need to understand that each time a check is made, the air seal at the valve is opened and dirt can get into the valve and damage the seal. In addition, if the seal is damaged or broken, water may also be allowed to enter. This is quite dangerous: water can freeze and crack the seal. If the gauge isn't used properly, the tire could even lose pressure.

One truck fleet doesn't take any chances with human error. The radial tires are equipped with a blow-through-type valve, and pressure is mechanically checked every time the vehicles are brought into the shop for a scheduled inspection and maintenance. All the tractor/trailer tires are serviced automatically by hoses on each side of the service pit, which air and equalize the pressure in all the tires at the same time within 3-5 minutes. This system does away with operator mistakes. You don't need to go this far to assure proper checking, but make sure your people do the job consistently.

Maintenance tire pressure checks should be scheduled at least every 30 days. Tires lose about 0.33 pounds of air each day. For every eight-degree increase or decrease in ambient temperature, one psi of tire pressure will be gained or lost. No more than 6 to 8 psi should need to be added to any one tire during a regular airing or inflation check. Any tire found to be more than 10 psi below the others on the unit should be checked further to find out why. Tires below 20 percent of normal pressure should be removed, inspected, repaired, and aired in a safety cage.

One consideration to keep in mind is that proper inflation levels depend on the loads that are carried. Load/inflation tables, which can be used to determine the required minimum inflation pressure for a given tire size and maximum expected tire load, are available from tire manufacturers. The Rubber Manufacturers Association (RMA) also offers an excellent guide, or you can request tire manufacturers' inflation tables for the exact

Notes

Notes

pressures and make sure they're used. Standardize the pressures across all fleet tires if you can. This will reduce the chance of an error.

CAUTION — Always use Approved Tire and Rim Combinations for Dumpers and Containers. See Page M2.3 for Approved Tire and Rim Combinations.

Engineering Data Book — Over-The-Road Tires

L9

(Courtesy of Goodyear Tire & Rubber Company)

You may need to impress upon drivers and maintenance personnel that proper inflation is the single most important item of tire maintenance, and that their cooperation is essential to a successful program. Inform them of the benefits to the fleet and to themselves: an inspection violation

Vehicle Systems and Specifications

or accident can be avoided; their own safety is better protected; and operating costs can be lowered. Being on the lookout for potential tire problems keeps down-time and damage costs to a minimum.

Tools

Along with a training program, make sure everyone has the proper tools to assist in tire maintenance:

- An axe handle, hammer, or “tire buddy” is useful for checking tires when hot. “Thumping” tires is recommended any time the vehicle is parked.
- A good pair of pliers should be available for removing objects from the tires.
- A quality tire pressure gauge (providing drivers and technicians with one will communicate the importance of accurate checking).
- A tire depth gauge.
- A tire pressures log on the maintenance inspection reports, pre-trip inspection reports, or the post-trip Vehicle Condition Report.

Putting a tire-inflation record of some kind right on the vehicle also helps to standardize procedures. A tire-pressure sticker, for example, can list the time when the unit’s tires were last inspected and inflated in addition to standard pressure, etc. Placed at the same location for every unit (inside the door on the driver’s side for tractors, above the left rear tire on a trailer), the sticker can’t be ignored.

Don’t forget new tire procedures. After mounting them, check the pressure again after 24 hours. New tires can expand somewhat during the break-in period and some pressure loss is to be expected.

Inflation and valves

Air pressure can be maintained only if valves are in good condition. The best valve designs contain a rubber seal to prevent air leakage. Valve cores with metal-to-metal seats are preferred; plastic designs are more subject to heat deterioration unless they are especially designed for high temperatures. It is also recommended that grommets in air valves be changed every time the tire is changed.

Also, remember to be careful about letting contaminants into the valve stem and tire when you check or inflate tires.

Automated inflation systems

By following the above tips and checking your tire pressure regularly, you should be able to keep tire malfunction to a minimum; but as an extra precaution, it might be a good idea to look into one of the industry’s most recent developments for protecting one of your biggest investments. After all, it never hurts to play it safe when it comes to something as costly as a blowout or premature tire wear. Recently, manufacturers have developed a device that promises to provide even more protection against the dangers of under- and over-inflation. Automated inflation systems, currently being marketed by several major manufacturers, can ensure that

Notes

Vehicle Maintenance Pro

Notes

your tires are at the right pressure where it counts the most — on the road.

These systems can be installed directly on the vehicle, usually on the axles themselves, and will monitor air pressure while the vehicle is in operation. If any tires fall below a certain air pressure, the system will inflate them to their proper level, with no driver involvement necessary. In addition, several models are equipped with warning lights that will indicate if a tire needs attention before a trip. Although each of the inflation systems on the market goes about its job in a different way, they all operate on the same premise, and should provide a safe and reliable way to maintain air pressure. If the system is working properly on the road, your tires should be, too.

Inflation air condition

A final word about air — keep it dry. Although some moisture is always present in inflation air, it's a good idea to take some steps to minimize it, since water in tires will result in rusty wheels, ply damage, and the potential for tire separation and failure. To keep water out of inflation air, use an air dryer on the shop air system and drain water traps often to keep compressed air lines dry.

To keep water out of tires:

- when mounting tires, make sure that the inside is clean and dry,
- use a lubricant that is not water-based; if that isn't possible, use water-base lubricants sparingly, and
- store tires in a dry place.

Tread check

Tires should be inspected regularly for unusual tread wear. Some wear can be predicted. Steer-axle tires usually wear faster when they are combined with tandem-drive axles than with single-axle drives. If they are applied during the summer, they'll wear faster than if mounted during another season. Left front tires generally wear faster than right front tires. Rotation of tires can even out tire wear for maximum tire life.

A typical rotation example might go as follows:

1. New tires are purchased for the steer-axle (where safety is of the utmost importance), and possibly for the drive-axle positions. If the purchase includes a new trailer, often the original equipment tires are moved to the steer-axle or drive-axle positions on the tractor.
2. After the steer-axle and drive-axle tires have worn to a certain depth, they can be rotated to a trailer.
3. Drive-axle tires can also be worn to certain depth (usually more wear than is allowed on steer-axle tires) and retreaded for the drive- or trailer-axle positions.

Some fleets, however, like to run some tread off a new tire in the drive position before putting the tire on the steer axle. This action buffs off the new higher tread, making the tire less susceptible to lateral movement

Vehicle Systems and Specifications

(squirm). Another tire path might be running the tires on the steering axle to a $\frac{7}{32}$ nd inch depth; rotate to the tag axle to a $\frac{2}{32}$ nd depth; then to the retreader. Steering-axle tire tread depth cannot be less than $\frac{4}{32}$ nds by federal law; tires which are retread candidates should be pulled from service when the tread depth measures $\frac{2}{32}$ nds to $\frac{4}{32}$ nds. This pull-point protects the tire casing from too much road damage and permits the retreader to process the tire without touching casing plies.

Matching tires: Bias-ply and radials

The best vehicle and tire performance is realized when tires of the same size, load range, and construction type are used on all the vehicle's wheels. A fleet may have a mix of radial and bias tires in use within the fleet. Since radials differ from bias-ply in construction, load, and cornering characteristics, tire manufacturers have discouraged fleets from putting the two types on the same vehicle. Nevertheless, a mixture of tires can be used safely if these rules are observed:

- NEVER mix bias-ply and radials on the same axle.
- NEVER mix bias-ply and radials in a tandem- or multiple-drive axle combination.

Here are some additional considerations:

- Two-axle trucks, dual rear tires or two-axle trucks, wide-base single tires: radials or bias-ply may be used on front axle, rear axle, or both axles.
- Trucks with more than two axles: either all bias or all radials may be used on the **non-steer** axles.
- Trailers, single axle: either radials or bias.
- Trailers, multiple axles: either radials or bias on all axles; mixed OK, as long as each axle has the same type.

If your fleet is in the process of converting to radials, do so systematically to avoid mixing problems. Remember that the drive position is not the best place to start radials. We all know that rolling resistance is the principal enemy of tire/fuel economy; so radials offer the least benefit here because of the resistance caused by torque passing through the driveline to the ground. Convert the drive axles to radials **last** if you can.

Matching tires: Duals

Tires in a dual assembly have additional requirements. The tires must match, they must be the same construction type (bias, radial, etc.), they must have the same size designation, they must have essentially equal diameters/circumferences, and the spacing between the tires must be correct.

Matching

We have already seen that one cannot mix tires of different construction on the same axle. Mismatching can also occur when tires have unequal inflation or unequal diameter. Either situation forces the larger tire to

Notes

Vehicle Maintenance Pro

Notes

take over the load share of the smaller tire; it becomes overloaded and a candidate for a blowout. If radials and bias-ply are mixed in a dual assembly, the bias tire will bear the load because radials deflect more under the load. It is therefore necessary to inspect dual-assembly tires frequently to ensure that they are matched, checking especially for inflation and making sure that any replacement tire will do its share of the work. Matching trailer tires will also improve tread wear in these free-rolling axle positions. If there are differences in wear (all other things being equal), rotating the lighter wear tire to the outside of a dual assembly can even out wear.

The maximum permissible diameter differences between the two tires having equal inflation pressures are:

- ¼" for 8.25 cross section (tubeless 9-22.5) and smaller sizes
- ½" for 9.00 cross section (tubeless 10-22.5) and larger sizes.

To determine if there is a difference, the tires should be measured 24 hours after inflation. The circumference of the tires is measured with a steel tape before mounting on the vehicle. Once on the vehicle, tire measurements can be checked by string gauge, straight edge, stationary tire meter, or large square.

Spacing and sizing

Air cannot circulate between dual tires if they are mounted too closely together. Heat decreases tire life and hastens tread wear, and can lead to catastrophic failure ("blow out"). Also, if the vehicle is severely overloaded, the two sidewalls could be too close to each other or even rubbing together, leading to overheated. Object stuck between the duals will lead to friction that can lead to excessive wear or a catastrophic failure. Instruct drivers to immediately remove any objects that become lodged between duals.

Too much space is equally undesirable. During turns, the outside tire will drag and scuff excessively. The distance between the centers of the two tires should be checked during PM inspections against the specifications and/or manufacturer's recommendations. If tire chains are used, additional spacing may be required.

Alignment

Once upon a time, good maintenance for better tire wear simply meant a front-end alignment and wheel balancing now and then. That prescription worked reasonably well for bias-ply tires, which wear out at a faster rate. The new radials, though, wear much more slowly. So it's important to even out the tread wear and keep the carcass in the best possible condition. The consequences of wheel and tire misalignment are severe, affecting fuel consumption, suspension wear, driver fatigue, and safety. Tires suffer too.

If the front wheels point exactly ahead, but the rear wheels were out of line, they would begin to force the front wheels out of line too. An example: if the thrust angle were 0.25 degrees to the right, the front wheels would be pushed to the left and the driver would compensate as the tires side-scrub in reaction. Engineers calculate that under these conditions, a tire will scrub sideways for more than 11.5 ft/mile. That's a lot of unnecessary tire wear.

The Maintenance Pro must turn his attention to the structure of the vehicle — namely, its total vehicle alignment. Improper front-end alignment is a major cause of irregular wear on steering-axle tires. If drive and trailing axles are out of alignment, this condition causes irregular wear on those tires and also on steering-axle tires, as the driver makes steering corrections.

Although we are discussing alignment in the tire chapter, it should be mentioned that alignment affects fuel economy, but more importantly, it affects safety. Any time that a vehicle part is misaligned, whether it is engine or axle, an unsafe condition is created. This is especially true for tandem rear axle alignment. When all axles are parallel, the vehicle tends to go straight. When the axles are not perpendicular to the center line of the frame, the vehicle will go in the direction it is pointed. In a tractor-trailer combination, there is potential for jackknifing if the trailer axles are not aligned.

Before starting an alignment check, prepare the vehicle and take a moment to make sure that other parts of the vehicle's front axle aren't the source of the problem. Be sure to check:

- Tire condition, size, tread pattern, and inflation.
- Rims for bends, cracks, and missing balancing weights.
- Hub assemblies for tightness, bearing wear, and oil/grease leakage.
- Springs for breakage or "fanning" (normally caused by loose U-bolts).
- Tightness of axle mounts (hangers and shackles) and bushings.
- Front shocks for mounting and condition.
- U-bolts for tightness.
- Kingpins and bushings for wear.
- Steering linkage condition and ball joint tightness.

Tire manufacturers point to three areas of the vehicle where alignment can affect tire wear (and they should be considered in this order): frame

Vehicle Systems and Specifications

alignment, drive-axle alignment, and front-end alignment. Although the front end is the most obvious place to begin, either when diagnosing a problem or beginning PM, it actually comes last in order of procedures. You want to be sure frame and rear axle alignment are correct before proceeding to the more expensive and difficult front end work (don't forget trailer tandems!). Every PM program should include regular checks to make sure that:

- the frame is square,
- the drive axles are parallel to each other and perpendicular to the frame and all drive axle attachment points (U-bolts, hangers, torque arms) are tight, and
- the front axle is square to the frame and has the correct camber, caster, and toe-in (improper toe-in contributes most to steering-axle tire wear).

Frame

One of the basic causes of total vehicle misalignment, frame rail or rails that are bent or improperly positioned, may be out of your control. Ideally, before beginning any alignment procedure, the frame should be perfectly square. Maintenance experts remind us that even when a new vehicle has a perfect frame, it doesn't take long before ordinary service, uneven terrain, chuck-holes, and uneven loads begin to distort that frame. So at least check the frame before continuing. Check for bends or cracks, loose frame rail to cross member bolts, and loose component mounts.

Drive axle(s)

Most Maintenance Pros conclude that if front wheels are accurately aligned with rear wheels, the vehicle will handle easily and safely regardless of whether the frame is perfectly square or not. Nevertheless, in the best of all possible worlds:

- the drive axle(s) should be positioned perpendicular to the frame or chassis center line and
- in the case of a tandem setup, the two axles should be parallel to each other.

Most drive-axle suspensions have provisions for setting alignment. The vehicle manufacturer and/or suspension manufacturer also have chassis service manuals that should be part of every shop library. But the checking procedure should be performed on a new vehicle and whenever a vehicle is in the shop long enough to perform the check. This is especially important for tandem drives. The recommended interval for a tractor is about 50,000 miles and, for a trailer, 100,000 miles. Minimum recommended time interval for a vehicle is twice a year; three times a year is ideal.

In order to put together a PM program to prevent misalignment problems, you'll need to schedule regular inspections of tires, suspensions, and steering assemblies, and perform alignment checks and corrections methodically. Many equipment manufacturers have field personnel to

Notes

Vehicle Maintenance Pro

Notes

advise and train fleet mechanics in this important area. Take advantage of their expertise.

The general procedure is as follows:

- Position tractor on level surface so that all suspension joints are free; release brakes; chock front wheels.
- **Securely clamp a nine-foot section of straight bar stock to both frame rails.** Use a carpenter's square to verify a 90-degree relationship between the bar and the frame rail. (See Figure to follow.)
- **With a trammel gauge or other device, measure from the bar to the center of the rear drive axle on both sides.** If the measurements differ by more than $\frac{1}{8}$ ", reposition the rear axle so that they're equal. The adjustment is made by changing the length of the torque rods, turning eccentrics, and/or adding shims.
- **In the tandem arrangement, measure from rear drive axle center to forward drive axle centers on both sides.** If the measurement differs by more than $\frac{1}{8}$ ", reposition the forward drive axle so that they are equal. After repositioning, move the vehicle backward and forward several times to allow suspension joints to set, then recheck both sets of measurements.

VEHICLE GEOMETRY CHECK

(Courtesy of Goodyear Tire & Rubber Company)

Front

To continue the check (and correction, if necessary):

- **Measure from bar to a point on each side of the front axle (outboard U-bolts are suitable) and confirm that both measurements are equal.** Reposition as necessary, according to directions in the chassis service manual.

Vehicle Systems and Specifications

Front-end alignment also involves some settings that are important for radial tire wear performance:

- **Toe-in:** the difference in distance apart at the front and at the rear of the wheels (as seen in top view); “toe-in” exists when wheels are closer together in the front; “toe-out” exists when they are closer together in the rear.
- **Camber:** the tilt of the wheel (as seen in front view); “positive camber” exists when the wheels are closer together at the road; “negative camber” exists when they are closer at the top.
- **Caster:** the backward (positive) or forward (negative) tilt at the top of the axle (as seen in side view).

Decide what checks you wish mechanics to perform during which PM inspection and check that they have good training and equipment to do the job. You may not need a chassis specialist in the shop, but skilled observations can head off major problems.

In normal vehicle operations, these front-end alignments change according to the load; however, most measurements are taken when the vehicle is unloaded, so some increases in settings will be required. The vehicle manufacturer should have data to use as a starting point. Keep a constant eye on tire wear and the patterns that appear. If an irregular pattern shows up, it may be a clue to some improper setting.

Toe settings generally have the greatest effect on tire tread wear and are the easiest adjustment to make. Gauges for measuring toe settings are relatively inexpensive and easy to use. They should be part of every maintenance shop, even the smaller ones. Using these gauges should be part of every PM routine.

Trailer axles

Misaligned trailer axles can contribute to tread loss on radial truck tires. Trailer alignment maintenance includes the same two conditions that applied to tractor tandem-drives:

- the forward trailer axle is positioned perpendicular to the trailer center line, and
- in the case of tandem-axle trailers, the two axles need to be parallel to each other.

Trailer manufacturers provide alignment procedures. They generally follow the method outlined previously, using the kingpin center as the reference point. In the case of tandem-drive trailers, the rear axle is aligned in relation to the position of the front axle. Axle alignment checks must be conducted periodically as part of a PM program.

The alignment of newly-delivered trailers should be checked to make sure the undercarriage is in adjustment. After the vehicle is driven for a short time, the settling-in period, the chassis can be expected to shift to the right in the shackles. This center-line shift increases as the trailer ages. The longer the unit is run, the more wear you'll see in the shackles. As the use of doubles increases, axle alignment will become even more

Notes

Vehicle Maintenance Pro

Notes

critical. If one or two axles on the front unit are misaligned, the alignment problem will grow progressively worse at the second trailer. We have been emphasizing proper alignment for tire wear. It is infinitely more important to think of these alignment checks as safety procedures.

Wheel/Tire balancing

With on-the-vehicle balancing equipment available, wheel balancing should not only be regularly checked on the steering axle, but also on all axles (including trailer) to achieve the longest tire tread wear. Out-of-balance conditions on the other axles create vibrations that are transferred to the driver, passengers, and cargo. Tire out-of-balance can be caused by careless mounting procedures, i.e. the improper seating of tire beads. (Use lubricant when mounting radial truck tires.)

Static balancing is performed while the wheel is motionless; weights are attached to the rim flange to offset an opposite heavy point. A better technique is dynamic balancing when the wheel is in motion. The heavy point of the wheel is found by rapidly rotating the wheel/tire assembly either on the vehicle or on a dynamic balancing machine.

Extending tire life

Now that you've invested in those radials, you need to keep them in good shape. We've already discussed driver inspections, inflation checks, and regular PM procedures. Good driving techniques can round out your tire program by contributing to longer tire life. Then we'll take a look at techniques to give the tire new life.

Driver techniques

Radial tires handle a bit differently than bias-ply. Because the sidewalls are more flexible and the tire grips the road firmly (the steel belts brace the tread, not the sidewall), radials on the steering axle yield laterally to absorb the strain of cornering. The driver feels more side-to-side movement which he or she may interpret as vehicle instability. The feeling is normal and is due to the increased sidewall flexibility of the radials. You can help by warning drivers in advance of the kinds of changes they can expect if they are not familiar with radials.

Tire life can be prolonged by sensible driving habits on the road. Since heat is the major enemy of tires, drivers should avoid quick cornering, abrupt starts and stops, and using trailer brakes to stop. Overloading at high speeds also creates unnecessary heat. Avoid spinning wheels, even in slippery conditions. Spinning rubs off the rubber and wastes fuel, and any foreign object lodged in the tire tread is simply forced in deeper.

Encourage drivers to keep the tires clean — they're easier to inspect for damage that way. Avoid parking in puddles of fuel or oil which can be harmful to tire rubber. Drivers already know the dangers of underinflation (and overinflation) and should be doing their part to maintain correct tire pressures.

Vehicle Systems and Specifications

Drivers should be aware that keeping the casing in good condition makes for a quality retread. They shouldn't ride up on curbs or rub tires against structures.

Remember: Speed can be costly

It's not uncommon for some owners/operators to think that making deliveries at higher speeds will lead to higher productivity. But fleet managers are finding that this may not be the case. In fact, there is plenty of evidence to suggest that higher speeds may pose enough dangers to tire life (as well as reducing safety and fuel mileage) to offset any productivity gains you make in delivery time. The reason for this is that all tires are designed to travel comfortably at a certain speed. By exceeding this speed, you'll subject your tires to a lot of unnecessary wear, creating problems that are sure to contribute to your maintenance and tire costs. Driving at faster speeds creates an increased heat build-up — perhaps a tire's greatest foe. Excessive heat will lead to irregular wear, reduced durability, and premature tire breakdown. In addition, higher speeds will also have a damaging effect on your fuel economy.

Still, if you've considered these threats and decide to continue making high-speed deliveries, you should take a few precautions to minimize threats to tire life. High speeds change your tires' dynamics and load rates, so to help reduce wear to your tires, you'll want to adjust your tire pressure and reduce your load size. Also take care to adjust your maintenance schedule. A good PM program is critical if your tires are operating under high-risk conditions.

Retreading

The past few years have seen some big developments in the retreading industry. With improvements in both methods and materials, retreading service providers have grown dramatically in quality. Retreading is no longer dominated by the small, unreliable roadside shops. Today much of the business is handled by large and efficient companies that often provide a marriage of tire sales and maintenance, in addition to improved retreading services.

A decade ago, operators could hope for one or two retreads before sending their tires to the scrap heap. Now, though, with careful tire management and a good PM program, many operators are finding that they can get several more retreads — up to a total of six or seven. When new tread is added to a radial casing in good condition, the tire can run for hundreds of thousands of additional miles with proper care. Time was when many fleets wouldn't consider putting retreads on their vehicles. But with new radials pricing out at over \$300 apiece, and the technological improvements being made in the retreading process, it's the rare fleet that isn't taking a look at retread advantages. Retreading is energy-efficient for the U.S. too. It takes only 1/5 the amount of crude oil to produce a retread as is needed for a new tire.

Notes

Vehicle Maintenance Pro

Notes

Retreading processes

Although retreading procedures vary according to the manufacturer, there are two basic processes: cold recapping and hot recapping. The former is based on the premise that heat can weaken the tire casing, so a relatively low temperature together with air pressure is used to bond the new tread to the casing over a period of time. In the other process, hot uncured rubber is applied directly onto the tire casing and cured in a chamber under heat and air pressure for several hours. Both processes have been used successfully and the choice made by any fleet is usually based on past experience or preference for a particular process.

Two other terms that you may hear are “mold” and “precure.” Precure is associated with cold-cap (55 to 58 percent of all recaps use precured tread rubber and 75 percent of radial recaps do) and mold with hot-cap designs. Time, pressure, and temperature are the variables in retread production. So ask questions about the retreading process you are considering and request test data. Because retreading has become so popular, new tire manufacturers will guarantee that their new tires are retreadable as part of the sales pitch.

The retread procedure

Whether the precure or mold process is used, retreading begins with a detailed inspection of the tire casing on a good tire spreader. Cracks, breaks, or punctures will show up under inspection with a light. Some defects can cause the casing to be rejected:

- excessive tread wear exposing the belts,
- too much bead damage from a bad rim or poor dismounting procedures,
- sidewall cracks that are too deep,
- loose or broken ply wires caused by running flat, and
- tread rubber separation that extends over too large an area.

Although repair technology to prepare a carcass for retread has greatly improved, it makes much better sense to pull the tire before extensive repair is needed. Retreaders have sophisticated machinery to analyze tire casings, i.e., using ultrasonic waves, high voltage electricity or laser beams to detect defects in the body of the casing. The casings can thus be graded and their potential for retread better assessed. These are high-cost pieces of equipment which demonstrate that retreading is here to stay and the technology can only continue to improve.

After the inspection, and any necessary repairs are made to the casing, it is buffed, and then rebuilt, either by adding a cushion gum bond between the new tread and the casing or by applying the uncured rubber right to the casing. The tire is then mounted for curing in a pressurized chamber. After curing and cooling, the new retread is again subjected to careful inspection.

Vehicle Systems and Specifications

Is retreading for you?

Large fleets must investigate retreading as a major way to hold down tire costs. Some smaller fleets have a different philosophy. With smaller commercial carriers that run low mileage and light loads, it is not always practical to retread their tires. Instead, they buy only top-quality tires and sell the casings after a specified mileage. That way, any tire failures are probably covered by warranty. If they happen on the road, the driver is more likely to find a tire dealer to supply a new tire.

One director of maintenance, who has decided that retreading is not for his fleet at present, says that it's hard to match retreads if there's a blowout on the road. He prefers to put his confidence into the brand new casing offered by the new tire. While admitting that retreading technology is constantly improving and that retreads are as good as new if prepared properly, he says there's always a risk in buying a "used" tire. Retreading is still labor-intensive and so there's room for human error.

He's right on this point. You must be prepared to work closely with a retreader to make sure that the product meets your specifications and standards for quality. Even if you decide not to retread, there's gold in those "old" casings. Take good care of them and you should get a top price.

Know your retreader

If you'd like to try retreading, but are still hesitant, try talking to one of the more sophisticated dealers and ask for a test. It's even better if the dealer can offer both new tires and retreading services and is knowledgeable about both. Such a full-service supplier might offer road service for added security, not to mention more advanced retreading services, such as application-specific retreads. Discuss your operation specifically. A good dealer should be able to analyze how well your tires will take recapping and then propose retread patterns that will serve your fleet's needs. Run comparisons of retreads and new tires to test how well retreads perform for your fleet.

The retreader should be able to assist you in setting up test conditions for your fleet. Since tire inflations and tread depth will be checked constantly during the test, it's a good time to put some good maintenance procedures into practice. You'll also want to test during a busy season; running lots of miles helps build up data quickly.

Get all the particulars from your retreader about guarantees, expected mileage, etc. And talk to other customers to see if they have been satisfied with retreading services. There have been lots of retreaders entering the market as the concept has gained acceptance. In fact the sheer numbers have kept competition high, so prices have remained relatively stable. However, some retreaders aren't around any more. You don't want your dealer to close up unexpectedly, so choose wisely.

It also helps to standardize the fleet's tires as much as possible. Narrow your purchasing down to two or three brands and check them out for original tread life and how well they have been retreaded by fleets similar to yours. Remember, though, that not all casings will last through multiple retreads. Much depends on your operation and maintenance practices. One industry estimate figures that 20 percent of new tires don't make it

Notes

Vehicle Maintenance Pro

Notes

to the first recap and only 55 percent last through a second. The challenge to fleets is to improve this figure: four to five retreads should be within the realm of possibility.

Retread requirements

A casing in good condition is the first requirement for a retread. In addition to good fleet PM procedures for inspection and inflation checks, a third way to improve casing life is prompt repair. All nail holes, cuts, cracks, etc. should be repaired immediately. Since most small fleets are limited to repairing simple punctures, working with a full-service supplier/retreader can ensure continuous care of your casings.

The extent to which tires can be repaired prior to retreading is amazing. In the future it may be possible to literally rebuild the entire tire! Repair services today are receiving less-worthy tires from the scrap pile.

For example, retreaders in the U.S. have concentrated their efforts on rebuilding the tread area from shoulder to shoulder. Yet European retreaders have been successfully rebuilding tires from bead to bead, repairing gouges or snags in the sidewall area. Even belt replacement has become possible. Outer steel belts can now be removed and replaced before retreading the tire. Section repairing, fixing larger areas of tread or sidewall damage by filling the gap with special rubber compounds or patches, is also growing.

Trucking operations have more flexibility when it comes to retreads. Retreads are limited to only non-steering positions on passenger-carrying vehicles. Also, passenger-carrying operations typically do not have trailers, which is where retreads on casings that are not in prime condition can be placed. A retread that isn't good enough for a drive axle can still fill a position on a trailing axle. The age of a casing should also be considered. A good retreader won't put a heavy tread on an older casing that is likely to die first.

If you're a dedicated customer of retreading and seek to improve the quality and durability of your retreads, you should note that steel/steel tires support retreads better than tires of any other composition. A fabric/steel construction, common in small tires (14-inch), do not hold up as well as they might because their casings are more susceptible to wear and damage from everyday operation. Steel/steel tires, on the other hand, use steel fibers and cords to help reinforce the casings and treads, and this construction allows them to resist casing damage, making them excellent and durable candidates for multiple retreads. The steel/steel tire has recently grown more available for medium-duty commercial trucks and buses, so you might want to look into the matter to see if they're worth the extra expense.

One final point on retreads. The CARB regulation mentioned earlier in this chapter applies to retreads as well. All 53 foot box-type trailers and the tractors pulling them that use recaps must be equipped with low rolling resistance retreads when operating in California. However, there are a few exceptions and an implementation schedule that allows existing retreads to be used to the end of their normal service life (see the CARB section in the Emission Systems chapter for details).

Vehicle Systems and Specifications

Other alternatives for extending tire life

One procedure that has been used primarily for bus fleets but is seeing some growth in trucking is regrooving. This process cuts additional tread depth into the base rubber of the tire to add better gripping power. Most truck tires sold today have a layer of base rubber under the original tread of about $\frac{10}{32}$ inch. After a tire is run for a while, the normal tread wear results in some loss of traction. The tire is still structurally safe, but it may not be suitable for slippery conditions. If $\frac{2}{32}$ nds to $\frac{4}{32}$ nds of original tread remain, (most manufacturers recommend $\frac{4}{32}$ nds to $\frac{5}{32}$ nds) grooves can be cut into the base rubber to allow the tire to run an additional number of miles before retreading.

There are some regulations regarding regrooving. Only tires with enough undertread for regrooving and which are labeled “regroovable” are acceptable candidates. There are also regulations in terms of the placement of regrooved tires you need to be aware of. First, regrooved tires are not allowed on the steering axle of a bus. Second, tires that have a rating of 4,920 or more cannot be regrooved and placed on the steering axle of a truck.

The normal process for placing regrooved tires is to “move them back” on the vehicle. An example is front and drive tires being regrooved and then moved to trailers (drive tires can be regrooved and put back on the drive position, if desired). However, a minimum depth of $\frac{3}{32}$ inch must remain below the new groove.

Cross-grooving or siping refers to making cuts in the tire tread, perpendicular to the tread’s grooves. Proponents believe siped tires run cooler and have better traction. The general feeling, though, is that the possibility of irregular wear and structural damage to the tire negates any traction benefits. It’s probably better to select a tire that is right for the fleet’s operation in the first place than to begin experimenting with cutting into the tread.

Retreading and any other casing repair or modification depend on the proper pull-point — removing the tire from service at the optimum moment. Only good inspection and maintenance procedures can help you in determining pull-points. Everyone involved with tires in your fleet should be very familiar with the tire tread depth gauge. Use one that measures to 0.001 inch and is easy to read. Check out other tire monitoring and repair equipment so that the three keys to long tire life can be performed efficiently:

- inspection
- inflation, and
- prompt repair.

Recordkeeping

It doesn’t matter how large a fleet operation you are involved with, a good system of tire records is an essential part of doing business today. Even the owner/operator needs to know exactly how many tires are on the road

Notes

Vehicle Maintenance Pro

Notes

or in the shop — or on the scrap pile. Only by knowing what you have, can you take steps to reduce costs.

Tire identification

Every *new tire* comes from the dealer with some identifying information already on it. Federal regulations, passed many years ago, recognized the need for tire control and safety. So every new tire bears a serial number that must be branded or molded on the sidewall. The letters “DOT” also appear on the tire to certify that the tire complies with the National Traffic and Motor Vehicle Safety Act and the Federal Motor Vehicle Safety Standards for tires. The serial number can include from seven to eleven characters (tire type can run from one to four characters and since listing the type is not required, this portion may not be included). Look for this kind of designation on the sides of any tire you see:

- The first two symbols are the manufacturer’s plant code, assigned by NHTSA.
- The next two symbols form the tire size code, which has been standardized across manufacturers.
- The optional tire type characters follow.
- The last three numbers are the required date of manufacture (the first two numbers identify the week and the last number gives the year); generally, most plants change the week designation on Sunday).
- This information may also be coded on the tire in a bar code or a RFID tag. These identification devices will normally include additional information above what is required by NHTSA.

Some carriers go one step further and assign their own identification numbers to tires.

Retreaded tires must carry a new serial number in addition to the original identification number. This number also includes a “DOT-R” as part of the string of characters. The retread manufacturer’s code is three characters rather than two (there are more retreaders operating). A size code comes next, followed by the optional one-to-four character tire type code. Finally, the date of manufacture appears as the same three-digit code. This retread serial number can be placed anywhere on the tire sidewall.

While there has been much discussion about a regulation that requires tires to be replaced once they have reached a certain age, there is no such regulation as tire service life is based on many factors. While the tire’s life will ultimately depend on many factors, including the tire’s storage history (was it stored properly before being installed, especially if there was an extended storage period?), service conditions, and the environment in which it operates, there are some general guidelines when it comes to tire age. Some tire manufacturers recommend that tires be replaced once they are six years old, regardless of use and condition. In other cases, some manufacturers cite 10 years as the maximum service age for tires, with more frequent inspections after the tire has reached six years old. However, you need to remember that incorrect storage (storing in direct sunlight or in areas with contaminated air) can significantly reduce the

Vehicle Systems and Specifications

maximum service age of tires. Check with your tire manufacturer for specific recommendations.

Branding

Many fleets add an identification number of their own before putting the tire into service. Branding a tire helps you maintain accurate inventory records and discourages tire theft. Care must be taken not to brand too deeply or in the wrong spot on the tire. Once cracks begin in the sidewall, they can spread out, weaken the tire wall, and eventually work down to the ply wire, causing tire failure. So:

- Limit brand depth to $\frac{1}{32}$ inch; and never allow depth to go beyond $\frac{2}{32}$.
- Place the brand in the panel provided on the sidewall. If your tires don't have such a panel, position the brand on the sidewall, midway between the rim flange and the maximum tire section width.

Tire control

Good tire control means being able to track the tire from the moment of purchase to the time it is sold or scrapped. The biggest problem for most maintenance people is keeping track of a tire when it comes off the vehicle for repairs and is replaced by another. A computerized system makes the job of collecting data easier and the reporting procedure automatic, but manual records will work just as well if you are willing to spend some time at them. A combination system can also be used, where the technicians generate paper reports that are entered into the computer later. Whether using a computer system, a paper-based system, or a combination, three basic records should track tires for the fleet:

- **The Tire Inventory Record** lists all the tires in the fleet. They are logged in as they are purchased and assigned a fleet identification number. It is helpful if that number reflects the order of purchase, i.e. "507" could be the seventh tire purchased in 2005. Warranty limits can also be listed on their record. If the fleet has several terminals, a location code could also be included, i.e. "25-507." Listing your tires in order of purchase also reveals older tires at a glance. As tires leave service, remove them from the inventory.
- **A Tire Mounting/Dismounting Record** is kept for every unit that has wheels, even trailers. Wheel position is noted (by number) as is tread depth to maintain an ongoing record. Retreads are handled in the same way. Note that inspections are not listed on the Mounting/Dismounting Sheet; these would be part of a PM checklist (which should also log tread depth). Airings are listed on the inflation sticker, placed directly on the vehicle. Only when a tire is removed for rotation, repair, or retreading does it get listed on the M/D Record. If a tire is rotated to another vehicle, it gets logged on that vehicle record and crossed off this one.
- **The Retread Record** does just that. It keeps track of the fleet's tires as they are sent out for retreading. The Retread Record is reserved for the fleet retreads. If you purchase retreads, they are

Notes

Vehicle Maintenance Pro

Notes

listed on the Tire Inventory Record as “new” tires because they need fleet ID numbers to get logged into the system. You may want to add any warranty to this sheet.

The Tire Mounting/Dismounting Record has a category that you will want to describe in detail if you aren’t already doing so. The “Reason” column asks for tire-repair details, rotation for tread wear, flat tire, etc. As we have mentioned previously, these records only need to be coded prior to use in a computerized tire program. If you are planning to computerize in the future, begin now to standardize the information. The kinds of monthly records that you could expect from a software program designed especially for tires would include a “new tires-in-service” report, a tire-age summary for the entire fleet, tires scrapped, etc.

Comparisons can be made of manufacturers, tire types, mileages and tread depths, and reasons for scrapping. With pull-points established, based on tread depth, you can also cross-reference to inspection records and project the inventory you’ll need. In fact, you’ll be able to determine average mileage for each $\frac{1}{32}$ inch of tread depth in the fleet and develop rotation and retread plans. These kinds of records are also invaluable for warranty claims. Tires that have failed may still be under manufacturer or retreader warranty. Any kind of failure trend is easily spotted with good records. Perhaps the fleet plans to trade some units and you’d like to mount the older tires in the fleet, good records can identify these for you.

RETREAD RECORD

[illegible]

Notes

Tire cpm

Another benefit of good records is cost control. Even though tire costs are a major portion of a vehicle's variable costs, many fleets are not yet able to track them accurately. The best measurement of tire cost is cost-per-mile. It is calculated just like vehicle cpm:

Add:

- purchase price,
- repair costs, and
- retread costs.

Vehicle Maintenance Pro

Notes

Subtract from this total the casing price if you sell it and any warranty pay back you received for the tire. Then divide this total by the total number of miles traveled. It may take a while for the information to accumulate, but once you can track a tire's history and costs in this way, you'll be able to make better purchase, retread, and discard decisions.

Also remember to adjust costs for any warranty adjustments. This can be a critical factor when you are studying costs (did the manufacturer or dealer stand behind their product?).

Failure analysis

Some Maintenance Pros believe that the place to begin effective tire maintenance is the scrap heap. All the fleet's tire mistakes (and successes) will end up here sooner or later. Scrap analysis helps to judge tire performance and your own maintenance practices. In fact, if you would like to try a new brand or type of tire, find a fleet using that tire and ask to see their scrap pile. You'll learn a lot about that tire!

Tire scrap analysis

Look at scrap to determine why a tire failed. Can you spot trends — the same manufacturer, the same tread type, the same retread, etc.? If the same tire type fails consistently, there may be a defect in the tire. It may not be the proper tire for your operation. If too many tires from the same retreader are on the pile, you may need to change dealers.

Tires ruined by objects on the road often can't be helped, but too many instances might point to the driver or to the yard. You just don't find the highways littered with that much debris. And it's surprising how dirty some terminal areas can become when regular cleanup is neglected.

Your tire records (the Tire Mounting/Dismounting Record) should have detailed the reasons why tires were discarded. Be specific and train mechanics to describe failures on ROs accurately. Can you add more symptoms to the following list?

Tread:

- abraded surface,
- bulge on tread,
- stones in tread,
- deteriorating tread,
- tread separation,
- ply separation,
- tread crack,
- diagonal tread wear,
- puncture,
- uneven wear,
- chain damage, and

Vehicle Systems and Specifications

- excessive wear exposing belts.

Sidewall:

- abrasion,
- soft rubber condition,
- tear,
- cut,
- snag,
- separation,
- flow cracks,
- tiny surface cracks,
- stress cracks from improper branding,
- exposed wire,
- bulge, and
- bead rubber cut, burned, or chafed.

The next step is to determine the cause of the failure. What caused the tread separation? What caused the uneven wear pattern? Driver abuse? Improper mounting procedures? Only by getting together once a month or so at the scrap pile can you and your mechanics make recommendations for changes.

While you're at the pile, it pays to stack the tires neatly out of the rain. Orderly classification of tires within the garage (tires needing repair near the repair area, repaired tires and new retreads near the mounting area) or outside under protection (tires to be scrapped) shows organization. You need to keep scrap tires dry for failure analysis. Orderly storing means you can keep an eye from month-to-month on whether the scrap pile is increasing or decreasing.

A second virtue of tire scrap analysis is identification and pulling out any tire that could possibly take a recap. Every casing that is rescued can delay a new tire purchase, so you want to be sure that good money isn't being thrown away. If you spot a tire that isn't good enough for recapping but will still hold air, could it be used as a spare?

Finally, looking at the scrap tells you how your tire maintenance program is doing. If too much tread wear and ensuing belt damage means that you've lost out on a recap possibility, you need to monitor tread depth more carefully during the tire's service life. Any time a tire is pulled for rotation or repair, the tread should be checked and recorded. Punctures that weren't repaired until they were large holes point to lazy inspections.

Also, look at your tire records for the tires on the scrap pile. Can you track the tire back to birth? Did the tire meet expectations? How many recap cycles did the casing go through? If you cannot answer these questions, review your recordkeeping. If you can answer them, but do not like the

Notes

Vehicle Maintenance Pro

Notes

answers, you will need to adjust either your purchasing practices or your maintenance.

Wear pattern analysis

Another failure analysis tool the maintenance manager can use to try to improve tire performance is wear pattern analysis. Wear pattern analysis can come into play in two areas, as part of vehicle inspections as well as part of tire failure analysis. It is ideal to spot the wear pattern during a vehicle inspection, so the cause can be corrected before the tire is too severely damaged and must be removed.

If the tire did not wear evenly, there was a problem with either the tire or the vehicle. Tire wear patterns can be directly related to a cause of the wear pattern. Here are typical wear patterns and their causes:

Center wear is typically a result of either overinflation or constant underloading. This wear pattern is a result of the tire tread not being “flattened out” on the roadway, and only having solid contact with the roadway with the center portion of the tread. The solution to eliminate center wear is to lower the air pressure in the tire.

“Edge” or “shoulder” wear is excessive wear on both edges, or the shoulders, of the tread. This is typically caused by underinflation or overloading. The wear is caused by the center of the tire tread “folding up” due to not being able to hold shape. This wear pattern indicates the need to run the tire at a higher pressure, or the need for a tire with a higher weight rating.

Side wear is wear on only one edge of the tread. This is typically a result of an alignment problem, most commonly with the camber adjustment. If the camber adjustment is not correct, the weight is not being distributed across the tire tread, and the inside or outside (depending on which way the camber is off) will be wearing excessively because of the extra weight.

“Toe” or “feathering” wear is an uneven side wear pattern typically caused by an alignment problem, most commonly a poor toe-in adjustment. The excessive toe-in or toe-out causes the one tire to constantly try to turn the vehicle, while the other tires are trying to make the vehicle go straight. The extra side friction on the one tire (or set in the case of duals) will cause the tire to slide sideways slightly as it goes down the road, leading to the wear. In both side and toe wear, the solution is to perform an alignment on the vehicle.

Cupping is normally caused by tire balance issues or suspension problems, such as poor shocks. If the tires are out of balance or the suspension is not functioning correctly, a certain part of the tire will be “impacting” the ground, rather than rolling smoothly, which is what causes this wear. If the cause of the cupping is not repaired, the cupping will enlarge to the point where it will reach from edge to edge on the tread. Checking and repairing the suspension (if necessary) and rebalancing the tire is the solution to cupping.

Flat spotting is different than cupping. Flat spotting is when a large section of tread is missing, creating a flat spot in the tread. Flat spotting is typically caused by drivers either skidding the vehicle at high speed,

Vehicle Systems and Specifications

or trying to drive the vehicle with a wheel, or set of wheels, not turning (park brake applied, wheel “frozen” in place, etc.).

Don’t forget the trailers! When performing inspections on trailers, remember to check wear patterns. In many maintenance issues, including tires, trailers are sometimes forgotten!

Summary

Make sure you are purchasing tires that match the job they are intended to perform. Also remember that tires contribute directly to operating costs in two ways: the cost to purchase and replace them, and in fuel mileage. Determine your fleet pull-points for rotating to other vehicle positions, recapping, and finally discarding, and stick to that standard. Your regular inspections — driver and shop PM — should record tread depth, tread wear patterns, and tire inflation. Pull tires when the vehicle is in the shop for a PM service if the tire is questionable for any reason. Tire problems are best dealt with on a preventive basis, rather than a breakdown basis.

You need to look at the pile of removed tires often enough to see why tires are failing and wearing, and to see if any tires can be salvaged or sent for recapping. There’s also the chance that a scrap tire may still be covered by warranty. Your tire records should quickly identify these at the time the tire is logged on the dismount record.

The sure thing about tire maintenance is that you cannot continue operating as you did in the past. Too much is going on in the field right now and only the informed maintenance manager will be successful in controlling tire costs. The time spent in setting up inspection and maintenance standards and keeping detailed records will result in extending tire life. That’s money that goes to the bottom line.

Vehicle Systems and Specifications Electronic Systems	
Electronic components	
Electronic engines Nearly all engines manufactured today are electronically controlled to one degree or another. Some of the older engines have only a small fuel/air management system, while most of the heavy-duty engines are fully computerized (fuel injection and air-flow sensing and performance is tracked and recorded). In heavy duty engines, when the driver operates the throttle the engine control module (ECM) adjusts the fuel and air flow to most-efficiently achieve the performance the driver has requested. Along with controlling the management of the fuel system, the electronic engines all have a memory. The memory is intended to shorten the diagnostic cycle in case of engine problems. The engine electronics on some vehicles can be programmed to shut down the engine to protect it from damage. Should the oil pressure or level go too low, or the coolant level go too low or temperature too high, the engine will warn the driver and then turn off. Some optional packages allow the diagnostic system to display trouble codes to the driver if a check engine or shut down warning light has come on. By activating the system the driver can get the trouble codes displayed on the dash. Example: with the key turned on and the check engine button pushed down and held, the check engine light flashes a pattern of one flash, followed by six flashes (trouble code of 16). By looking in the troubleshooting guide the mechanic can tell the driver what to do to correct the problem. Part of the programming on some electronic engine systems allows supervisory personnel to set the vehicle to go no faster, or generate more power, than a pre-set limit. Once the speed, RPM, or power limit is reached, the computer will limit the amount of fuel to only what is required to maintain the desired speed, RPM, or power. Finally, the memory on these systems can become useful in case of a performance problem or an accident. All that is required to retrieve the data is usually a laptop computer or similar device and specific software. It is highly recommended for liability, maintenance, and warranty tracking reasons that you regularly download these systems (and save the data). These systems are very data-intensive, and require coordination between many sending units, sensors, processors, and actuators (injectors, etc.). The diagnostics built into the system are designed to save time and money. Rather than trying to sort through the system and locate a	

Vehicle Maintenance Pro

Notes

fault, the system can tell you what components it is not communicating with or are not working correctly. If you are not going to get the training and equipment required to download and work with this data, you will need quick access to OEM service.

Electronic transmissions

Automatic transmissions are now available in both hydraulic and gear-drive configurations, both of which are electronically controlled. The hydro-drive transmissions use sensors and controls to shift the transmission at optimum shift points based on load, demand, and engine speed. Automatically shifted gear-drive transmissions use electronic sensors and controls to shift the gears at specific RPMs. This transmission offers the best of both worlds. It maximizes efficiency and fuel mileage by not losing power to the hydro-drive system and does not require the driver to have a high level of skill to shift the transmission.

ABS and traction control

The antilock braking system, and the associated traction control system, are a combination electronic/air (or hydraulic) system. The electronic sensors and processor make decisions, and then influence the operation of the air or hydraulic system, if necessary. As well as being data-intensive (the wheel sensors are constantly checking and reporting wheel speed to the processor), the system also has an active portion (the modulator valve that releases/applies the brakes and the throttle control) that works off commands from the data system.

One problem with ABS/traction control systems is that portions of the data system (the wheel sensors and the associated wiring) are in less than ideal positions (at the wheel ends). This location leaves them exposed to environmental hazards. While the components that are in these locations are designed to be there, they will still require extra attention during vehicle inspections.

One misconception about ABS is that it is not required. This is not true. If the vehicle was required to have ABS when it was built, the ABS is required to be in working order. It is not an out-of-service violation if the ABS is not functioning correctly, however, it is still a violation of the regulations (§393.55).

Instrumentation

Anyone who has been involved in maintenance for any length of time can tell you the improvements that have been made by changing from an electric instrumentation system to an electronic system. By using sensors and electronics, rather than sending units and wires, instrumentation wiring and troubleshooting has been simplified. Also, placing the instrumentation information on the data system has made many of the other systems possible. Because of the integration of the instrument information into the data system, a Maintenance Pro needs to remember that removal of instrumentation (or not repairing faulty instrumentation) can lead to other systems not functioning (or not functioning correctly). An example would be a faulty speedometer system.

Vehicle Systems and Specifications

When this fails the cruise control, ICCS, and other systems cannot operate correctly. Without the speedometer data, the engine may not even operate correctly.

On-board diagnostics

Earlier we discussed the engine diagnostics. While this is typically the largest diagnostic system on the vehicle, it may not be the only one. Many of the components on the vehicle may have independent diagnostics that are connected into the vehicle electronics. Some systems (such as emissions systems) are fairly easy to diagnose, and the diagnostics simply use a tell-tale to notify the operator of a problem. Other systems (such as transmissions) may have a diagnostic memory that can be accessed to troubleshoot problems (or check the status). As with engines, being able to access the diagnostics in such components is critical.

Electronic safety systems

There are presently several electronic safety systems available. Here is a list of what is available, along with a short description of each. One key point to these systems is the vehicle needs to have the ability to support them. These systems will increase the demand on both the electrical system and the electronic communications network on the vehicle.

Collision warning systems

Collision warning systems (CWS) use radar, sonar, infrared, or laser technology to warn the driver when the vehicle is getting “too close” to another vehicle or an object.

These systems require mounting of hardware (the sending unit, the processor, and the display), electrical connections, and calibration on

Notes

Vehicle Maintenance Pro

Notes

installation. Some vehicle OEMs are now offering these systems as an option. This is preferred to aftermarket installation, for integration reasons, but may not be preferred for cost reasons (aftermarket installation may be cheaper in some cases). These units are mostly self-contained, and do not require anything from the vehicle except electrical power.

Roll stability systems

Roll stability systems (RSS) use yaw and roll sensors to sense if the vehicle is approaching the edge of its stability envelope. If the vehicle becomes unstable, the system communicates with the engine, telling it to reduce power to avoid a rollover. In some vehicles the system will even make intelligent braking decisions to stabilize the vehicle.

These systems are data intensive. The sensor will constantly be sampling the environment and reporting to the processor, which will be constantly making stability decisions. If an intervention is called for, the RSS unit must initiate communications with the engine through the vehicle's electronic system. This is true even if the RSS system uses its own wiring for sensor-to-processor communications (or is one integrated unit). Another issue with these units is the establishment of parameters. Different settings than those provided by the factory may be required depending on the stability of the fleet vehicles. These systems are also available as an aftermarket product as well as being offered by some OEMs as an option.

The next generation systems, referred to as electronic stability control (ESC) systems are now becoming readily available. These systems, as well as preventing rollover as the RSS systems do, also watch for over- or under-steer situations that could lead to loss of control. They use basically the same sensor packages, as well as power control and intelligent braking to help the driver maintain control of the vehicle.

The National Highway Traffic Safety Administration (NHTSA) has proposed requiring ESC systems on large commercial vehicles in the future (they are already required in certain new light-duty vehicles). As a Maintenance Pro, you need to begin the process of getting familiar with these RSS/ESC systems. The use of them is going to be increasing, and if in the future they become mandatory all new commercial vehicles will be equipped with them.

Lane departure warning systems

Lane departure warning systems (LDWS) use video technology to alert the driver if the vehicle is departing its lane without the turn signal active. The system is designed to help the driver avoid "wandering" into other traffic lanes or leaving the roadway.

These systems require the installation and calibration of the sensor system, the processor, and the display. They may also require recalibration over time. While this is a data-intensive system, it is normally self-contained and requires only electrical power from the vehicle.

Intelligent cruise control systems

Intelligent cruise control systems (ICCS) is another data intensive system that communicates with the engine computer to slow or accelerate the vehicle by adjusting fuel flow to the engine, based on input from other onboard systems. Normal cruise control only maintains vehicle speed based on the driver selected speed. The ICCS works with other safety systems (normally CWS, RSS, and/or LDWS) to accelerate or decelerate the vehicle based on a threat. Some of the ICCS systems are active even when the driver has the cruise control switch in the off position. Experimental versions under development would even apply the brakes to prevent or minimize the effects of a collision. This is accomplished by using the additional brake system components, or electronic brakes, to apply the brakes.

Because of the level of integration that is necessary, ICCS is best installed as an OEM option. Aftermarket installation is possible, but can be difficult.

Electronic tire pressure monitoring system

A tire pressure monitoring system (TPMS) is an electronic system that monitors the tire air pressures on the vehicle. The TPMS reports real-time tire-pressure information to a panel or warning light on the dashboard. Some systems will simply warn the driver that he/she has a low tire, while other systems will report the pressure in each tire to the driver and/or alert the driver which specific tire is low on air. These systems are available through OEMs (either installed at the factory or as an aftermarket product) and or through TPMS manufacturers as an aftermarket add-on. These systems vary widely in complexity, integration, and installation difficulty.

A related system is the automatic tire inflation system. These systems not only have sensors that determine the air pressure in the tires, but will automatically inflate low tires. These systems typically have extensive installation requirements. However, in certain applications (such as using super single tires), the cost and installation labor time may be offset by the savings the system will generate.

Electronic on-board recorders and automatic on-board recording devices

Electronic on-board recorders and automatic on-board recording devices (EOBRs and AOBRDs, which are now collectively known as “electronic logging devices,” or ELDs) are devices intended to record a driver’s duty status. These systems take the place of the driver’s paper log. They presently rely on the vehicle for data and power to function legally and correctly. Data on engine performance is integrated into the system to determine when the driver is actually driving, how far he/she has driven, and when the vehicle was parked. These systems require a driver input panel so the driver can enter non-driving duty correctly.

Most ELDs are aftermarket add-ons, requiring integration with the vehicle data system when installed. Many of these devices will simply connect

Notes

Vehicle Maintenance Pro

Notes

into the J-bus or OBD (depending on the vehicle's electronic system) using a diagnostic port and one wiring harness. However, some of the systems have extensive installation requirements. Also, older vehicles may require the installation of speedometer and tachometer sensors to make them compatible with the newer devices.

The next generation of these devices (based on a proposal released in March of 2014) would have to be connected to the J-bus of the vehicle and capture specific data sets from the ECM. Speed, mileage, engine hours, and RPMs are examples of what the ELD would need to be capturing off of the ECM on a regular schedule (a minimum of once per hour during operation, as well as any time the driver stops the vehicle or changes duty status).

Many of the ELD systems available are not only logging devices, but also include a communications system. This has the advantage that only one installation is required to end up with both an electronic log and communications system on the vehicle.

This is another system Maintenance Pros need to begin the process of getting familiar with, even if your company is not using one. These systems are gaining in popularity, and there are proposed regulations that would make them mandatory in the next few years.

Communications systems

Communications systems can be as simple as a cell-based, talk-only system or as complicated as a combination cell/satellite system that checks its location using GPS and reports the vehicle status and present and past activity on a predetermined schedule.

Because of the wide variety of these systems, their varying complexity, and their differing specifications, you will need to decide what you want to use the system for. That will determine which products you should be looking at, and then you can determine what integration will be required with the vehicle. The larger, more complex systems can take 8 to 16 hours to install in certain circumstances, and have extensive integration requirements (integrating into the engine data system, speed sensor, GPS receiver, etc.). Others install in as little as an hour or two (bolt on and plug in).

You will need to be aware of two regulations when looking at the various communications systems. The FMCSA has regulations prohibiting texting while driving and using a hand-held mobile telephone (cell phone) while driving.

The texting rule (§392.80) prohibits the use of any communications device that involves the reading or entering of letters or numbers while driving a commercial vehicle. Fleet communications systems that require reading or entering letters or numbers are covered by this rule. "Driving" is defined in this rule as driving on a public roadway, including momentary stops due to a traffic situation or a traffic control device (a driver cannot text while stopped in traffic). To assist in compliance with this rule many communications systems that use text have a "shut down while in motion" option. This turns the display for the system off once the vehicle reaches a certain speed. If this option is used, the maintenance department will

Vehicle Systems and Specifications

need to know how to activate it and how to verify that it is still working correctly.

The regulation prohibiting the use of cell phones while driving commercial vehicles (§392.82) may also influence the decision on what communication system is used (and subsequently, what work may be required of the maintenance department). The regulation prohibits the driver of a commercial vehicle from leaving the normal driving position to reach for a cell phone, holding a cell phone, and dialing a cell phone while driving. If the driver can initiate and answer calls using either voice commands or a single touch (without holding the cell phone), then use of the cell phone is allowed. This regulation may lead to Maintenance Pros dealing with requests for the installation of docking stations, remote control buttons, or Bluetooth compatible devices if the carrier chooses cell phones for the company communications system.

Event data recorders

Event data recorders are intended to track the driver's and vehicle's activities, and provide a means to improve the performance of both. They are also known as "black boxes." These recorders can track vehicle speed (minute-by-minute and average), brake applications (times when the brakes were applied, number of times the brakes were applied, and brake force applied for each braking), engine RPMs (minute-by-minute and average), the driver's engine demands and the engine's performance, along with many other parameters. These systems can be part of the existing electronics on the vehicle that only needs to be accessed and activated, or they can be a separate system installed to track the driver and vehicle performance.

Notes

Vehicle Maintenance Pro

Notes

System interoperability

Interoperability is a word borrowed from the information technology people. It has to do with how well various pieces of hardware and software will work together. Where problems arise is when there is too much traffic on the system, when the system cannot coordinate the traffic coming through it, or the components on the system are not speaking the same language.

While this has traditionally not been a concern in heavy-duty vehicles, it is becoming one as we continue to add systems and subsystems onto the on-board electronic system. To illustrate this point, just consider how many data collection points are trying to communicate with, or report to, the engine control module. Now consider how many of these data points are also trying to communicate with other components on the vehicle (speed sensor to the engine and the speedometer, as an example).

The spinal cord of a heavy vehicle's electronic system is the J1939 data bus/system. All electronic systems on the vehicle communicate through, and are coordinated by, this data bus. The engineering of this system has prevented most data communications problems.

Case in point. The National Transportation Highway Safety Administration (NHTSA) conducted extensive testing on the J1939 system. The tests were done to determine the realistic capacity of the system. Once that was determined, they also wanted to discover what stresses are being placed on the system and what happens as more systems and sensors are added to the system. What they discovered was that J1939 systems are extremely robust.

According to the NHTSA tests, the data system on a heavy-duty vehicle going down the road normally operates at 20 percent of capacity. Each additional system that is added to the vehicle (electronic transmission, LDWS, ICSS, etc.) will increase the workload 5 percent. Because of data trying to enter and exit the system, and priorities assigned to the data, they saw system performance begin to suffer when 50 percent of capacity was reached. Please note, the performance suffered by small fractions of a second at 50 percent of capacity. It was not as if the system stopped working. Certain nonpriority data was delayed entering or exiting the system by fractions of a second. There was no drop in vehicle performance.

As part of the test, the engineers wanted to see how much data it would take to overload the system to the point that vehicle performance suffered. To accomplish this they had to use six ECMs (the biggest data user, sender, and receiver on the system is the ECM) and have them all trying to send large, priority messages at the same time to overload the system. In the real world, this is just not feasible.

The typical J1939 system assigns priority to the TSC-1 traffic. TSC-1 are the torque and speed commands from the driver to the engine (also referred to as throttle commands). As other systems were added, they were assigned a priority either by design or by "fate" (added systems get lower priority). The bottom line to this is that no matter how much they loaded the system, the throttle commands always made it through without delay.

Vehicle Systems and Specifications

The testing did turn up one item the Maintenance Pro needs to be aware of. If there is a communications problem caused by the J1939 system, the vehicle may not show a fault to the driver, or store a fault in a diagnostic system. This is because the J1939 system does not have its own diagnostic system or diagnostic memory. It relies on the components that use the system to identify, display, and store problems.

	Notes
Personnel	
Recruiting, Training, and Retaining Technicians	
Having addressed the shop operations and the vehicle systems and specifications, we are ready to move to the third area of operations — the people. You can reorganize the layout and equipment of the shop much more easily than the persons who work there! So we'll begin this discussion with the person over whom you have the most control — you. The maintenance manager/supervisor The number of supervisory personnel depends, naturally, on the size of the shop. A large fleet employs a director of maintenance, who may have a corporate staff position. That individual will have a shop supervisor who reports to him. The structure is two-tier: the managerial level where policies and standards are developed and the supervisory level where the policies are translated into day-to-day activities. The manager in the large fleet is further away from the shop activities; in fact, since he has a shop supervisor, he really isn't required to have a strong maintenance background. This can cause problems, though, because he is required to set maintenance standards. If your operation is smaller, you, as maintenance director, probably also supervise the technicians. Yours is a trickier position! A strong maintenance background is highly desirable because you need to answer questions from technicians, parts people, etc. Your challenge is to avoid getting so involved in specific problems on the floor that you no longer have the time to manage. As supervisor, you are being paid to do more than solve a problem on a particular vehicle. You aren't supposed to pitch in during crunch situations, either. What exactly are the management responsibilities, not supervisory responsibilities, that fall to you? • The shop safety program is an important responsibility that is all yours. In a large fleet, you would consult with the shop supervisor in developing the safety standards but you would define the program and direct the shop supervisor in how to enforce it (he's responsible to see that the shop employees carry it out). In the small fleet, this important duty is a top priority for you. You will need to be involved with drivers so that any maintenance measures taken to improve vehicle safety aren't spoiled by uninformed drivers. You may also need to justify equipment purchases made for improved shop safety to fleet management. Safety is a subject that involves vehicle, driver, technician, and management. It is one area where you must be aware of the needs of all three "parties". • You will need to be involved in spec'ing of new equipment if maintenance costs down the road are to be contained. A poor judgment in specs can also mean increased driver discontent, i.e. a fuel-economy engine that they only see as cutting down available power.	

Vehicle Maintenance Pro

Notes

- As a manager, you must hire the right number of people to service the vehicles and the right kind of people to support your maintenance standards.
- Finally, it is your responsibility to set up the maintenance standard. This includes the PM inspection/service schedule and items to be handled, *and* the repair standard. The repair standard is the length of time that a particular repair job should take in your shop. It is based on fleet experience, and your own personal experience as a technician, together with some published rates as guides if needed. A time rate comparison is really the only way that you can judge a technician's performance on the job.

Only by having a maintenance standard can you improve the shop's productivity, or the output of the shop. The standards must be realistic: if you set them too high, technicians will become discouraged and leave. Set them too low, and employees won't try to improve. Finding the right balance is a delicate undertaking which requires an empathy with people combined with a realistic attitude toward the bottom line.

We have already discussed shop safety procedures and participation in vehicle specifications planning as part of your job as Maintenance Pro. Staffing is also a top job priority, but not just hiring and firing — let's think more in terms of personnel planning. When a Maintenance Pro puts together the right number of people in the right place at the right time, i.e. puts the right number of technicians in the right facility to service the vehicles at the lowest cost, we can say that his personnel planning has been successful. Because all shops employ technicians, we will limit our discussion to that employee.

The technician

Shortage of technicians

The numbers seem to indicate a tight labor market for skilled technicians. Statistics show that there are fewer new, young technicians entering the field. Through attrition and retirement, some of the most prized technicians have left the field. Many employers are finding it difficult to fill vacancies due to the unusual schedules that the industry requires, and the constantly changing technology continues to raise the bar on who can actually work on the equipment. Many individuals with the electronic skills to work on more sophisticated vehicles have opted to enter other fields. Turnover rates show that one in three technicians switched jobs each year among motor carriers. The industry is finding that the quality of applicants wishing to fill vacancies often lack the skills or qualities needed to perform the job description.

Personnel

According to the Bureau of Labor Statistics, people employed as truck, bus, and diesel technicians will be approximately 280,000 by 2008. However, the Technology & Maintenance Council stated that the automotive and trucking industry will need over 600,000 new maintenance personnel by this same timeframe.

Even with such a bleak outlook for the labor market, you cannot compromise safety to fill a position with a warm body. Standards should be set and a complete job description created with full expectations that a highly-skilled candidate will fill it.

Formulating a job description

The hiring process is weighted with many variables. To get the best results, you'll need to have a clear picture of the position you plan to fill — its demands, requirements, and expectations. For this reason, the importance of a job description cannot be overstated. A comprehensive, itemized description of the position to be filled will not only help you clarify your own needs, but will also provide the employee with a written list of your expectations and any health or physical risks that may be associated with the job. You'll know just what you're looking for and your technician will know just what he/she is getting into — and whether he/she is qualified. Completing the description is the first step in any successful employee search.

Assessing the needs of the position

Every shop is unique, with different equipment, services, objectives, and hazards. It stands to reason, then, that every shop will have its own unique priorities when it comes to hiring a technician. So, if you're planning on filling a position in your shop — whether you're creating a new opening or hiring to fill an old one — begin by assessing your personal needs. What do you expect in a technician and what do you hope for? What kinds of equipment will your technician be required to operate and maintain on a daily basis? What kinds of services must he or she be able to provide? How much physical activity will be involved in his/her duties? Are oral or written communication skills valuable to you or necessary to the position? How much experience would you like your employee to have? These are just a few of the questions you must ask in order to define your hiring priorities.

At a minimum, a comprehensive job description should include:

- **Job purpose** — Begin your job description with a concise, direct statement of the goal of the position e.g. "To repair company equipment in a safe, timely, cost-effective, and practical manner." This will give both you and your employee a precise idea of what the job will entail.

Notes

Vehicle Maintenance Pro

Notes

- **Duties** — In this section, list the specific tasks and duties that make up the job. This is perhaps the most important part of your description, so be thorough and try not to take any essentials for granted. For instance, don't forget to stipulate that your technician should know how to operate your various technical instruments, and should be able to build, maintain, and repair the components of your fleets.
- **Accountabilities** — This is a detailed section in which you list the skills, abilities, and areas of knowledge that your technician will need to possess in order to do his job efficiently and competently. Professional conduct, familiarity with safety procedures and hazardous materials, and timely completion of paper work are examples of accountabilities.
- **Eligibility requirements** — Here you'll want to list the necessary prerequisites to the job. This section should not only include the legal requirements, such as a CDL and knowledge of government safety regulations, but also your own demands. List the number of years of experience you're requiring, along with level of education, etc.

Once you've covered all of your skill requirements for your technician position, it's time to address some of the issues your employee should know about before taking the job. This includes descriptions of the physical requirements and work environment, along with a list of the hazards associated with them. These sections are added not only for the sake of liability, but also to keep your employee informed about the dangers inherent to the position. It's always a good idea to be completely honest with your employees, especially at the time of hire. It will help to build a rapport with your employees and establish your shop as a place of honesty and integrity.

Remember to include:

- Physical requirements
- Work environment
- What tasks unrelated to vehicle repair will be required of the technician, i.e. vehicle washing, parts chasing, shop equipment repairing, vehicle fueling, and shop cleaning. This is important to productivity because you are paying a skilled technician for unskilled work and many technicians want to know up-front, how you value their time and expertise.

Personnel

The following is a sample job description for the position of technician. Use it to develop or revise your own:

Position Description	
ABC TRUCKING CO., INC.	
JOB TITLE: Mechanic	DATE:
DEPT. OR DIVISION:	STATUS:
REPORTS TO:	JOB CODE:
WRITTEN BY:	
APPROVED BY:	

JOB SUMMARY OR PURPOSE:
To repair company equipment in a safe, timely, cost effective and practical manner.

Depending upon the level of experience and the degree of supervision involved, this position description may apply to the following job titles: Apprentice Mechanic, Mechanic's Helper, Mechanic, Lead Mechanic, and Journeyman Mechanic. Specialized jobs might include bodyman, fenderman, and painter.

JOB DUTIES:

- Build, rebuild, and repair all parts of automotive equipment as may be required in the department to which they are assigned.
- Diagnose any mechanical, electrical or other breakdown or failure to a motor truck or related equipment.
- Read precision instruments such as micrometers, dial indicators, bore gauges, voltmeters, digital multimeters, calibrators and other electronic diagnostic tools.
- Troubleshoot and perform failure analysis of the component parts and systems on the truck or truck tractor; or the component parts and systems of the trailer or convertor dolly. (This requirement may not apply to body and frame specialists.)
- When applicable use welding skills and knowledge of metals to complete truck repairs. Individuals who work on convertor dollies must be able to weld horizontally and vertically without air pockets in the bead.
- Apply knowledge of DOT, EPA, and OSHA rules and regulations.

ACCOUNTABILITIES:

- Knowledge, understanding, and application of the safety practices related to this position.
- Knowledge and understanding of the proper handling of hazardous material.

Notes

Vehicle Maintenance Pro

Notes

- Completion of all paper work and records in an accurate and timely manner.
- Knowledge and understanding of DOT, EPA, and OSHA rules and regulations.
- Professional representation of the company and the trucking industry.
- Maintenance of an adequate amount of hand tools to accomplish daily work.

JOB SPECIFICATIONS:

Eligibility requirements:

- Must be able to read and write and have the mental capacity to complete required paperwork and records.
- Must possess a valid Commercial Driver's License.
- Must have at least ____ years of truck repair experience, body and frame repair experience. (School may account for part, but not all of this experience.)
- Must have working knowledge of most of the systems located on a truck or truck tractor, a semi-trailer or convertor dolly.
- Must be able to read precision instruments such as micrometers, dial indicators, bore gauges, voltmeters, digital multimeters, calibrators and other electronic diagnostic tools.
- Must be able to troubleshoot and do failure analysis of some of the component parts and systems on the truck or truck tractor; or the component parts and systems of the trailer or convertor dolly. (This requirement may not apply to body and frame specialists.)
- Must have welding skills and knowledge of metals—individuals who work on convertor dollies must be able to weld horizontally and vertically without air pockets in the bead.
- Must have training and working knowledge of DOT, EPA, and OSHA rules and regulations.
- Must be willing to participate in training classes that are given by the company or requested by the company.
- Must be willing to move into different departments to keep the company running in an efficient operating manner. (This may include a shift change.)
- Must be willing to take tests to provide management with information to be used for management and classification. (These tests may be written and/or oral.)
- Consistent with company policies, individuals are expected to maintain superior customer relations; be involved and committed to the quality process; be willing to train and give aid to fellow employees; work in an efficient and economical manner; receive constructive criticism and praise in a business-like fashion; and maintain a positive attitude.
- Must be willing to work on any piece of rolling stock and associated equipment owned by the company.

Personnel

Notes

Post Offer:

- Must meet or exceed the medical standards of the U.S. Dept. of Transportation.
- Must satisfactorily pass a drug test.

Physical requirements:

- Must be able to move, operate, lift, and store specialized equipment that includes, but is not limited to welding equipment, hand tools, shop machines, and power tools.
- Must be able to complete repairs that may require bending, twisting, climbing, squatting, crouching, and balancing.
- Must have the ability to accomplish specialized detail work required in some repair and diagnostic assignments.
- Must have the ability to accurately read gauges and dials.
- Must be able to exit and enter the vehicle's cab. Cab floor level is generally from 36 to 66 inches from ground level, with exit and entry achieved with the assistance of various configurations of steps and handholds.
- Must be able to spend ____% of the day standing and ____% of the day walking on surfaces such as concrete, wood, and metal.

Work Environment:

- Mechanics may spend ____% of time exposed to heat, cold, dust, irritants etc.
- Mechanics may work with, and be exposed to hazardous materials.

Statements included in this job description do not necessarily represent an exhaustive list of all responsibilities, skills, duties, requirements, efforts or working conditions associated with the job. While this is intended to be an accurate reflection of the current job, management reserves the right to revise the job or to require that other or different tasks be performed as circumstances change.

Applying the regulations

Many operations are unaware that their technicians are actually *drivers* for DOT purposes, if the driver operates commercial vehicles on the highway. This means that all the necessary paperwork that would be kept for actual drivers must be kept for technicians. To determine if your technicians fall under the driver regulations found in Parts 382 and 383, and 390 through 396, you need to consider the following factors:

- Do your technicians test-run vehicles defined as a commercial motor vehicle (CMV) as found in Sec. 390.5?

Vehicle Maintenance Pro

Notes

- Are these vehicles taken onto a public highway as defined in Sec. 390.5? This can include a private driveway or parking lot which allows public access. Even pulling a CMV out of the shop and parking it a parking lot that the public has access to would make your technicians into drivers by these definitions.
- Are you involved in interstate commerce as defined in Sec. 390.5? If not, you would need to contact your individual state agency to see which of the federal regulations have been adopted for intrastate commerce, and if any exceptions exist or definitions differ.

If you meet the criteria, your technicians are subject to the following regulatory requirements: driver qualification, hours of service, and vehicle inspections, and possibly the CDL and drug and alcohol testing requirements. These requirements are discussed in the Compliance Management section.

Specialized training and certification

Training is a part of the management picture in any company interested in the bottom line — “it increases profit by decreasing losses,” according to one transportation industry safety director. Some specialized training and certification requirements are currently in place which come out of one or the other sets of federal regulations. If you are responsible for training as part of your job duties, you need to be aware of these special requirements. Some are quite easily met, often right on the job, but you do need to recognize them and do the proper certification, etc. for them.

Several sorts of specialized training need to be taken into account:

- OSHA right to know training,
- OSHA tire mounting and dismounting training,
- FMCSA periodic (annual) inspector training,
- FMCSA brake inspection training,
- DOT hazmat employee training, and
- EPA air conditioning technician training and certification.

These requirements are also covered in the Compliance Management section of this manual.

There are other specialized training and certifications that you may consider for your technicians. These can include:

- Original equipment manufacturer training and certification programs.
- Automotive Service Excellence (ASE) training and certification programs.
- Trade association training.
- Continuing education through technical training centers.
- In-house or outsourced programs developed to improve technical skills, supervisory skills, leadership abilities, knowledge, teamwork, and efficiency.

Personnel

A key point to remember when it comes to retention: If the technician feels that he/she cannot grow within your operation, the technician may start looking for somewhere else that will allow him/her to grow. The bottom line to this is either provide an outlet for your good technicians who wish to grow and develop, or watch them go somewhere else.

As the technician gains skill and knowledge, the technician becomes more valuable for the operation (less time on tasks, less rework, more efficient use of time, etc.), laying the foundation for justifying pay increases (do not discount the value of pay raises in developing and retaining good technicians!).

The relationship of developmental training to retention is such that some major players in the maintenance area (major motor carriers, leasing companies, OEMs, etc.) are now budgeting time each year dedicated strictly to technician development. It is not unusual in such cases to see the company dedicating as much as 40 hours per year of the technician's paid time to training. It is also not unusual to see these employers providing a tuition reimbursement program. If the technician takes a class on his/her own time that is related to the job's core responsibilities, the company reimburses the cost of the course after successful completion (in some cases even providing a bonus for exceptional grades).

As we discuss the remaining topics in the chapter, remember this: Most employees do not leave their present employer over pay. As long as the pay is competitive, the employee will leave for a "better job." Therefore, to retain your technicians, you need to be the employer that offers the better job. Typically, a better job is one that has better hours, more room for advancement, and/or better working conditions. Better working conditions can include providing:

- a safe, comfortable, and clean working environment;
- an atmosphere where employees feel that are being kept well informed rather than kept in dark;
- an atmosphere of teamwork rather than subservience;
- room for development and growth;
- employees more input into the job; etc.

Building the team

You're already familiar with the shop paperwork: driver reports, repair orders are the big carriers of information, plus PM inspection/service sheets. These forms are common to most fleets. In addition to forms, fleets may circulate manufacturers' bulletins, fleet policy handbook updates, or the fleet's own service bulletins or letters. We have mentioned how important standardized reporting is, i.e. drivers and technicians both understand exactly what is meant by a description of a vehicle problem. A detailed RO with a check-off repair code makes communication from technician to supervisor much more efficient — and ready for computer data entry. So improving paper communication is often a matter of standardizing and improving forms so that everyone is "talking" about the same thing. And everybody knows just what is expected of him or her.

Notes

Vehicle Maintenance Pro

Notes

Knowing the reason why or being able to see results (a decrease in road failures, for example) can convince technicians that the shop PM is on the right track and that they are helping that effort. But how about the more personal “paper” communication from you, as a representative of the fleet. A birthday card for the technician, an appreciation card (with a bonus!), or a holiday can go a long way in making an employee feel that his or her efforts are appreciated. Too many managers forget these personal touches, but the big fleets with many employees to keep track of don’t forget. They know that their success depends on keeping the employees that they have trained.

Talking to people isn’t so easy. Or should we say, talking is easy for most of us — it’s listening that’s tough! Even after you’ve refined your “paper” communication, you’re only half done. You need to be able to tell your technicians and other shop employees about the shop safety and productivity goals and then enlist their cooperation in that team effort. That requires some listening on your part.

Reward technicians that do well. If a technician is consistently on time with repairs and has little or no rework, find some way to reward him/her. Jackets, certificates, belt buckles, and gift certificates are examples of incentive awards that are not very expensive, but very much appreciated. Wouldn’t it be great to “have” to give all your technicians a new jacket every fall because they all are consistently on time with repairs and have a low rework rate?

Consider helping technicians further their qualifications by offering outside training at company expense. Updating or adding to SAE qualifications and attending manufacturers’ training classes would be examples. Remember also to reward these efforts. A technician who is willing to attend extra training and be more efficient in the shop should be worth a little extra pay.

Communication: Up-the-ladder/Down-the-ladder

If you (as a representative of fleet management) write up a policy and distribute it to shop employees, that’s sending the word down the ladder. If a technician drops a note into the shop suggestion box, he’s sending a message up the ladder. We can see very quickly that much more down-the-ladder communication exists in any business than the other way around (most of us don’t have many opportunities to tell the boss what’s on our minds).

Your job as shop supervisor is to keep the lines of communication open to you from the shop floor (up the ladder) and to send the right kind of communication down that same ladder. Your attitude is critical. If you hide away in your office and don’t respond to technicians’ complaints or suggestions for improvement, you won’t get any after a while. Then just try to find out what’s going on. If you rush to defend yourself about some less-than-perfect decision in the shop, technicians will see that you don’t like to take that responsibility and they’ll keep “unpleasant” news from you.

Many executives brag about their “open-door” policy, (an employee can walk in at any time to air a problem). But first you need to visit the

Personnel

shopfloor, circulate around and catch problems where they're easier to handle. By the time they get to your office, the whole problem may be out of control.

Shop meetings

Many managers prefer to establish a regular time and place where planning and discussion can take place between the manager and the staff. Such staff meetings, or shop meetings if you will, should take place as often as is practical — once a month is a useful interval to begin with. If the fleet employs drivers, they should get together with you and the technicians several times a year — especially if a PM program or any other action affecting both parties is just being put into practice.

Here are some hints for the Shop Meeting:

- **Be sure that you understand both sides of an issue, the view from management and that of the employees.** Both of these groups look to you to represent their interests. Whenever possible, show employees that their goals are often the same as those of management (especially in the areas of safety and productivity).
- **Pause to think whether an order or policy can best be communicated via paper or via a face-to-face meeting.** Writing a letter to drivers and technicians about a vehicle complaint that isn't getting solved isn't such a hot way to handle the problem. Similarly, only talking about the safe way to inspect a radiator without a demonstration or illustrated safety bulletin may go in one ear and out the other. A talk can be followed up by something written for an effective presentation that will be remembered.
- **Plan an agenda for the meeting.** Every meeting should have some regular topics: failure analysis of some part, a persistent mechanical problem, an evaluation of new equipment or a safety feature. If there is any hint of driver discontent with the way vehicles are maintained, here's the place to start defusing the situation.
- **Whether commendation for good work or special effort (like exceeding a performance standard) should be made public is up to you.** Be aware though, that some of the best run fleets today are posting merit raises and cash-bonus awards openly, contrary to long-accepted business practices of keeping any pay information strictly secret. Remember that once employee performance is quantified or measured in some way, you have a real basis for offering incentives and rewards. No more will you have to guess who your best technician is — you'll know. And by giving training assistance to less productive technicians, you're telling them that you're confident they can set and reach the same goals. Verbal appreciation for a job well done is always good management policy, but nothing creates enthusiasm for safety or productivity like extra cash. When your recordkeeping backs up claims of increased productivity, you'll find it easier to justify technician incentives to fleet management and so reward those who have contributed most.

Quality circles

You've probably heard of this term, which originated in Japan as a means of getting workers involved. From five to fifteen people, all members of one work group (the manager is usually included) meet regularly on a volunteer basis. The purpose of the "quality circle" is to discuss specific problems relating to quality that are brought up by management, members of the circle, or other employees. Have you ever thought of using this idea to solve problems in the shop?

Too time-consuming, you say. Yes, you're right. Studies show that at the beginning, things do move slowly, sometimes chaotically. But that speed is more than made up for later in the time it takes for an idea to be accepted by the employees. It's a fact that employees are more likely to support a policy that they have helped to create. So try asking if any technicians would like to form a "quality circle" for shop safety, for example. You might be surprised at how quickly things can get organized. And at how high their standards can be!

Having discussed facilities and labor, we come to the final point of the operations triangle: materials. For the maintenance shop, this means replacement parts — finding them, keeping track of warranties, and stocking them in the shop.

Personnel	Notes
Performance Evaluation	
The basics	
Performance evaluations supply information that can be very useful in fostering good employee relations and achieving high performance. Few managers or supervisors enjoy doing performance evaluations, however. They take time, they can be uncomfortable, and can lead to poor morale if not done correctly.	
Some companies have formal performance evaluation programs, and others have little more than a policy of open communication used to cover any performance issues. Since evaluations are not required, some companies choose not to conduct them at all. There is no set process for what is right for all companies. Company policy and culture need to be considered in determining which strategy works best.	
Performance evaluations let employees know how they're doing, what they can do to improve or move up, and provide an opportunity for recognizing good performance. The evaluations are also communication tools used to identify employee strengths and weaknesses. And they are tools to communicate goals and achievements. The information can help the organization be more productive.	
Other benefits of performance evaluations include the following:	
• They provide opportunities to identify new ideas and improved methods. • They help avoid potential legal issues. • They allow employees to see how their work fits into the company goals, and why their work is important. • They provide opportunities for employees to convey personal conflicts that adversely affect their work performance.	
Poorly run performance evaluations may have a negative impact. They may:	
• Lead employees to feel that the evaluations are adversarial and are used to place blame for overall company performance. • Inhibit open communication between the managers and the employees. • Be used as an opportunity for managers to promote their biased opinions of certain employees.	
Performance evaluations should be designed to gather facts, identify potential problems before they arise, and provide for open communication. The evaluator needs to be objective, and needs to be familiar with	

Vehicle Maintenance Pro

Notes

the evaluation process, along with how the information gathered is or can be used.

Evaluation should reflect actual performance

It is crucial that performance evaluations accurately reflect the employee's actual work performance. If this is not the case, employers are opening themselves up to discrimination claims, if an employee is discharged for actual "poor performance," even though the employee's performance evaluation reflected "good performance." In other words, an employer would have a hard time justifying its actions against an employee, if those actions were contrary to what the performance evaluation said.

Establish goals for performance

One of the first things to establish is what the goals of the company are and how employee tasks and performance fit into those goals. From there, the goals of the employees' position can be formulated and geared to mesh with the departmental goals. These need to be communicated to the employee. Knowing where they fit into the big picture provides them with a feeling of value, that the work they do has a place of importance in the company's overall goals.

To help establish goals, the evaluator may want to review each employee's training, experience, skills, and qualifications, along with his or her job performance since the last evaluation. This should be done prior to the evaluation. The evaluator may want to consider this information in regard to the employee's career opportunities in the company, or any obstacles that may exist.

Personnel

Delivering negative feedback

Delivering negative feedback to an employee can be challenging, however it's one of the most important parts of a good performance evaluation. If an individual isn't aware of areas that need improvement, he or she will have a difficult time improving and meeting goals and expectations.

As with most feedback, it's important that negative feedback be given in a constructive way. To help with this, you may want to consider giving the employee specific examples of how to improve in specific areas. For instance, providing an employee with additional training or certification opportunities may help if the employee is subpar in their work level.

By providing improvement suggestions, employees are more apt to feel optimistic about future success.

Ensure consistency

Some organizations perform the same type of evaluation for all employees, while others have different types for different levels of employees. Evaluations for management level employees, for example, may have more qualitative information than line employees. This may be because management level employees do not engage in activities that are easily quantifiable; i.e., they do not do ten oil changes a day, but they may put in place a process that increases the department's output of quality work. If you have lower level maintenance managers under you, you would want to use a different evaluation for them then you would use for the actual mechanics.

Performance evaluation criteria

There is no set-in-stone list of aspects that need to be addressed during a performance evaluation. The performance criteria used in an evaluation is usually rated on a scale, to allow for quantitative measurement. The scale will vary from company to company and will depend on such things as type of position, corporate culture, and many other factors.

Following is one example of a performance evaluation form, listing performance and measurement criteria.

Notes

Vehicle Maintenance Pro

Sample Performance Evaluation Form

Name _____

Title _____

Date of evaluation _____

Your performance during _____ is evaluated on this form.

Every effort is made to present a fair and impartial review of your performance and how you are doing as an employee at this company. Your strong points, contributions, and accomplishments are noted, as well as areas needing improvement.

Performance Evaluation Criteria			
Performance factor	Exceeds requirements	Meets requirements	Unacceptable
Accuracy			
Thoroughness of work			
Job knowledge			
Quantity of work			
Initiative			
Attitude			
Flexibility			
Resourcefulness			
Dependability			
Working relationships			
Adaptability			
Safety			
Attendance			

Overall performance rating:

If all or a majority of ratings fall in the same category, then the overall rating would be that category. If there is no obvious overall rating, it is the responsibility of the evaluator to determine the weighting factor of each rating to determine the overall rating.

- ☐ Exceeds requirements — Performance exceeds requirements for most major accountabilities. Results are consistently at this level.
- ☐ Meets requirements — Performance meets requirements for all major accountabilities. Results fully meet expectations of job performance.
- ☐ Unacceptable — Performance does not meet minimum requirements for the job. Significant improvement is needed for results to be acceptable.

Major Accomplishments:

Training for performance evaluations

Those who need to perform employee performance evaluations may benefit from learning some of the pitfalls to avoid and how to handle certain situations. It may help them to know about rater biases and what to do if an employee refuses to accept responsibility for his or her performance.

At the very least, those who are to perform evaluations will need to know the process for doing them — who they are to evaluate, what forms to use, what information to gather, when to conduct the evaluation, and why they are doing them in the first place.

From there they can be taught how to rate employees, what to evaluate, and how to score. Additional training can include the following:

- Maintaining open communication;
- Documentation — not only of the evaluation, but of the employee's ongoing performance;
- Appropriate places to hold the evaluation;
- Listening skills, and
- Coaching.

As indicated earlier, employee performance evaluations can run the gamut from basic open communication between management and employees, to formal processes. Whichever one is used, it should be objective and based on facts. Information should be documented, but such documentation should not include information that involves age, race, gender, or any other protected class.

How to conduct a performance evaluation

A performance evaluation is a means to:

- Review and measure an employee's performance.
- Determine individual strengths and weaknesses.
- Set individual objectives in line with corporate objectives.
- Identify any training needs.

Appraisals are meant to be two-way communication tools. Employee feedback can be instrumental in determining business-related decisions.

You may find yourself communicating to some employees more than others about performance issues. If you have employees whose job performance is borderline, a performance appraisal is a good place to encourage and guide them.

Performance evaluations for technicians

The performance evaluation of technicians is based mainly on time (scheduled & unscheduled), materials used, and level of knowledge in the area in which they work.

The amount of "scheduled" maintenance done in a shop has improved dramatically since the mid-1970s. Then, if a fleet could report 45 or 50%

Notes

Vehicle Maintenance Pro

Notes

of maintenance as “scheduled”, it was assumed that the figure was extraordinary. In 1980 it took superior effort to make 60% scheduled repairs. Today, the shops designated as “model shops” are handling up to 70% of repair on a scheduled basis. Although this high percentage is only achieved by the best of shops, it is worth noting because of the great amount of standardization and control that goes into the maintenance procedures of these shops.

Let’s review our terms:

- **Scheduled repair** means that the work was planned; the vehicle was brought into the shop at a scheduled time, the technicians knew it was coming, and therefore did not have to leave other work to service it.
- **Unscheduled repair** means that the assigned work in the shop was interrupted to service the vehicle, i.e. a technician was taken off another job to take care of it.
- **Emergency** is unscheduled repair in which the fleet’s schedule is interrupted in addition to the shop’s; often the driver is forced to wait around until the repair is taken care of. (Driver complaints, flat tires, cold-weather jumpstarts, etc. are usually defined as emergency work.)

What are your definitions for these terms as used in your shop’s ROs? Did you make a rapid calculation of what percentage of ROs were scheduled and unscheduled for the past several months in your facility? How did your percentage compare?

The maintenance standard, which you should have already determined, is a PM inspection/service standard. In a perfect world, that standard would be all that is needed; with good PM, vehicles would never break down, all components would be replaced before they failed, and tractors would be traded just before the engine needed an overhaul. Unscheduled repair will always be with us, however. The goal of PM is to minimize unscheduled repair. A standard simply makes sure that procedures are consistent. Repair standards do exactly the same thing: they outline the steps to be taken in diagnosis and repair.

A repair standard is used primarily for measuring technician performance. It is related to time and quality control. A repair standard means setting a time for each type of repair. The time control, or expected-completion time can come from different sources:

- **a flat-rate guide such as the automobile-repair industry uses** (a truck dealership maintenance shop might have a similar guide)
- **a review of your own ROs** (provided that you have enough spaces for specific in-out times on the form and that recordkeeping is detailed and consistent)
- **discussions with your own technicians or other experts in component repair or general repair services.**

Personnel

Time control

Since your own ROs are the easiest documents to obtain, reviewing them is the quickest way to set up an expected-completion time; just be aware that your shop inefficiencies may be built into those repair times. Begin with some of the most common repair tasks in the shop and note the total time that the technician spent on the repair — from diagnosis to picking up the parts to completion of any testing. Make comparisons for just one technician. How consistent are the times? Then make comparisons for another technician, using the same job. Who has the best time? Who has the worst? What is the average time?

Don't forget to note whether there were any rework occurrences (how many?) for this repair. Remember that at this point we are not evaluating an individual technician, nor should you be deciding who your top technician is; we are only trying to find a shop average for the repair.

This may be a place where you can make use of computer reports, if you have a maintenance program sophisticated enough to give you technician productivity and time information easily, especially broken out by specific tasks. If you don't have access to this kind of software, don't despair though, it is possible to come up with comparative information manually as well.

Once you have the average time, set your standard time, based on your own training and experience if you wish (keeping in mind that yours is a subjective measure), or by simply cutting the time by a percentage. This final time standard becomes your expected-completion time. You're always able to change it later if it doesn't work out, but you have to start somewhere!

Allowing technicians to take time to check out other things that they may spot on the vehicle is always encouraged. More often than not they perform work not itemized on the RO. This is fine as long as the work is described in the "remarks" section and time-in/time-out is clarified.

Quality control

The "quality control" part of your repair standard ensures that the test/check/action procedure is performed in the same way every time. When a problem comes into the shop, the technician starts by performing diagnostic testing to determine the cause of the problem. Troubleshooting charts provide suggestions for diagnosis; most likely, the experienced technician has over the years developed a set of personal mental "check-lists" to get to the source of a problem. Your objective is to standardize that procedure for each repair so it becomes the most efficient checklist for every technician in the shop.

Rework tracking

As part of your quality control program be sure to track "rework." Rework is a term used for work that has to be repeated because of misdiagnosis or improper preventive maintenance or repairs. Remember, some rework is unavoidable due to complicated systems that are prone to misdiagnosis and supervisory decisions. What a maintenancemanager or supervisor

Notes

Vehicle Maintenance Pro

Notes

needs to watch for is repeated rework or rework that is required on fairly simple repairs. If a technician is seen to have a high rate of rework, consider retraining the technician in troubleshooting or repair procedures.

Sound like a tough order? Your technicians are too independent for that kind of interference? Or perhaps they are already performing in a superior way? (Your ROs will tell you if they are; then improving efficiency may simply mean better scheduling.) Well and good. But tightening up on repair completion time is being used by the big fleets to boost efficiency and you should at least determine if you need to use some of their methods. Some methods for improving repair-completion time and quality include:

- **having one skilled, experienced person, familiar with the fleet's maintenance operations (shop supervisor, lead technician, etc.), prepare all ROs before they go to the line technician.** This is the first step to standardizing the procedure. The preparer will also eventually be responsible for adding an expected-completion time to the work order
- **sending along a diagnostic checklist with the RO,** the checklist outlines precisely the steps to be taken by the technician to find the problem and repair it
- **computerizing the diagnostic procedure.** The technician plugs in the problem on the terminal and the microcomputer presents a selection of solutions to that problem. After completing the work, the technician records time, parts, etc.

Improving technician productivity after the evaluation

Once you have your time standards for a particular job, measured your technicians' performances against them, and set the new standard to shoot for, you are faced with the challenge of bringing underachieving technicians up to standard and motivating productive employees to improve performance even more. Remember that it is your responsibility to set the standard. It is up to your shop supervisor (or yourself) to monitor how well the standard is being met and to take steps to bring performance in line. Here are some suggestions for doing so.

- **First, ask whether any equipment aids could help.** A new tool or piece of diagnostic equipment can be a powerful motivator and training aid when standardizing procedures. And of course any tool improvements should cut down on time.
- **Investigate whether pre-packaged repair kits from a manufacturer might speed up a job.** These kits range from PM kits (oil and fuel filter, with bottle for fluids analysis) to in-frame overhaul kits (all instructions, special tools, parts, warranty, etc.) One fleet which is increasing its kit use, reports that it's much easier to track repair time with them. In the manager's experience, an injector replacement presently takes three shop hours, a bearing roll-in takes eight hours, and a complete in-frame overhaul takes 24 hours. He adds that not having the right part or tool can waste a tremendous

Personnel

amount of time for the technician. The kit also guarantees that nothing is overlooked, i.e. a gasket or filter.

- **Ask the technicians themselves where they're getting bogged down on a particular job and what suggestions they have for making it more efficient.** Ask for their suggestions on speeding up parts distribution within the shop.

One shop supervisor reports that time spent in personal discussions with technicians after major repair jobs has really resulted in improved productivity for that job when it is performed the next time.

- **Then, begin training for any weak techniques.** If completion times differ a great deal for a brake adjustment, (or even a chassis lube), establish the standard and then conduct a training session on the right way to perform the procedure. You can also do this for a PM inspection or any job that needs tightening up.

One large fleet developed a slide program for training with hundreds of truck closeups, demonstrating the right way to do a PM inspection. Not only did the "class" go through the steps but the technicians were told why a particular action was important.

The program is used to train new people and to "refresh" experienced technicians. As new vehicles are added to the fleet, changes or additions can be added. Participation by everyone is encouraged; often technicians make suggestions on how to improve a procedure or what to watch for when checking a component.

Are you smiling to yourself, sure that such an in-depth program is fine for a big fleet but you'd never have the time to take on something of that size? That may be true, but is there just one job where you seem to be showing the procedure over and over? Or something that just isn't being done right? Or consider that PM inspection. If you develop it right just once, and then repeat the program (or have the lead technician do it), this saves money by saving your time. The most expensive training is the kind of "show me" training that a supervisor does more than once.

- **Teaming a new technician with an experienced employee is another way to train on a smaller scale.** The "master" technician will have refined his techniques over the years (no wasted movement, organized techniques) to the point where he should be one of the faster technicians and he'll also have hints to pass along to the newcomer. Such a short-term team effort helps the two individuals get to know each other better and makes the newcomer feel part of the total operation.
- **Factory schools or seminars at your shop, staffed by technicians from component manufacturers, are always a source of new information and training.** You and your technicians can't afford not to take advantage of this expert training.

For maximum use of the out-of-house instructor's expertise if the training is to be held at the shop, collect "problem parts" pertaining to the training well before the appointed date. Try to have any "live"

Notes

Vehicle Maintenance Pro

Notes

demonstrations performed on your own vehicles. You want the instruction to be as practical as possible and directly related to your vehicles. A lively session on why certain parts failed always sparks good discussion and starts your technicians thinking “why” as well as “what”.

Do your technicians accept training? The average age of technicians is getting younger and the idea of continual training is often more easily accepted by this group of people. (Older technicians may feel they know everything they need to know and may resist the idea.) Remember, too, that it isn’t enough to simply provide training. Fleet management often wants to see concrete results. Evaluate the training by testing if possible (ask if evaluations are part of an instructor’s program) and by following up to see if the new techniques are being used. Allow enough practice. And use refresher materials later on. Follow-up means getting your money’s worth. And if you send a technician to a factory school, let him know in advance that he’ll be responsible for shop demonstrations when he returns.

- **A library of shop manuals, bulletins, and similar materials should be part of every shop.** Every vehicle model should have a complete set of service manuals. Dealers also have service bulletins that can pertain to your vehicle repair procedures. Special “engine” binder notebooks should be maintained. Manuals relating to shop equipment should be available apart from the vehicle materials. Regulatory material relating to vehicles should also be kept in the maintenance shop. Encourage employees to use the materials — not only for troubleshooting — but also to keep up on what’s happening in maintenance.

Keep information up to date: weed out the old junk, organize materials into binders, maintain manufacturers’ files. And while you’re at it, subscribe to some maintenance/industry magazines and check on whether they’re read. If you are scheduling or plan to schedule staff meetings, ask a technician occasionally to check out and research a problem and report to the group. You shouldn’t always be doing this kind of problem-solving yourself.

Large fleets — especially those which operate in many locations — often issue a prepared procedures manual to each maintenance shop. The manual is used to keep technicians informed about all kinds of maintenance operations. One fleet’s manual contains over 250 bulletins covering 35 general topics; these are updated as new

Personnel

information comes out from the manufacturers of their equipment or problems develop with a particular component. This kind of information also standardizes procedures since they are placed directly in shop areas as well as the maintenance supervisor's office (the former have plastic-laminated pages, which is an indication of how much they're used).

Eight sure ways to fail at performance evaluations

Performance evaluations are usually done at the employee's anniversary. It is up to you to decide what is the best way to perform these evaluations for your managers and technicians. The following are eight areas that can cause a performance evaluation to take a wrong turn. These should be avoided in order to make the performance evaluation experience a positive one for all.

"This is the first I've heard of it"

While there are many supervisors who provide feedback throughout the year, there are unfortunately many who do not. Regularly discussing an employee's performance allows the employee to make improvements over the course of the year. A supervisor should be careful not to keep a record of mistakes to bring up at the evaluation. Instead, the problem should have been addressed when it was apparent. An employee cannot work on or correct areas of weakness if they are unaware of your expectations. Performance management is a year-round event.

All this negativity

Beginning the evaluation with sub-par performance rather than positive accomplishments sets a tone. An evaluation should have some focus on the things that went well or were done properly. Even though a performance evaluation is a time to address problem areas, a supervisor must also leave the employee with a reason to want to remain at the employer.

Winging it

A performance evaluation should not be done off the cuff. The person who is assigned to evaluate the employee needs to have an understanding of the projects the employee is working on now and how he or she performed on last year's evaluation. This will give a foundation for completing the human resource paperwork. It's more than checking boxes on a form and writing a few comments. You want to focus on continued improvement from year to year.

Postponed until further notice

Employees expect their evaluations by a specific date, usually linked somehow to an anniversary date, job transfer date, or promotion. In many instances, the review is a basis for a merit raise, and a supervisor who is late on presenting the information is viewed as indifferent toward the employee. This feedback is seen as the last thing the supervisor wants to deal with, which the employee may project on him/herself.

Notes

Vehicle Maintenance Pro

Notes

Monologue

A performance evaluation is not supposed to be a monologue. It should be a dialogue between management and the employee. The individual performing the evaluation should ask open-ended questions to draw out feedback from the employee.

Defensiveness

This performance evaluation is a time for employees to offer suggestions to the organization on how they can do their jobs better. When an employee does this, it sometimes is viewed as a criticism of the supervisor who is evaluating. If the supervisor becomes defensive, the dialogue will end and any ideas to better the organization will be stifled.

Failure to communicate

Not everyone is a natural-born communicator, including supervisors who conduct performance evaluations. They may know their “stuff” and what the motor carrier employees are supposed to be doing. But if the one conducting the evaluation does not clearly layout the information he or she wants to convey, the employee may leave the evaluation without a clear understanding on how to improve his or her performance and what expectations are being placed on him or her.

Sparing feelings

It's hard being the “bad guy.” Many bosses are reluctant to offer constructive criticism or correction to their employees even when it is warranted. Motives often include people-pleasing or a concern that it will appear on someone's permanent record, affecting his or her career path. This is especially true if the supervisor conducting the evaluation sees the employee as a peer. This may occur if the supervisor has worked his or her way up through the ranks. If concerns are not addressed, especially those that affect safety, it could result in a catastrophe.

Although it may be very difficult to do, conducting performance evaluations is an important part of any business, and plays directly to the productivity of the entire company. This is a time when personal feelings must be set aside and discussions of performance and areas of improvement must be brought to light, backed by solid observation and documentation.

Compliance Management DOT	Notes
Part 393 — Parts and Accessories Part 393 regulations enumerate the various parts and accessories which must be included on a properly-equipped motor vehicle being operated in interstate and foreign commerce. In addition, the regulations may permit or restrict the use of other types of vehicle accessory equipment. However, the Federal Motor Carrier Safety Regulations (FMCSR) do not cover the manufacturing specifications for these parts and accessories, but rather indicate only the general type(s) which must be used for safe operation. In many instances, the rules also specify placement on the vehicle. Specific motor vehicle parts and accessories manufacturing safety specifications are found in Part 571. The requirements in Part 393 are applicable to all employers, employees, and commercial motor vehicles which transport property or passengers in interstate commerce. A <i>commercial motor vehicle</i> is defined as having a gross vehicle weight rating of 10,001 pounds or more, designed to transport more than 8 or 15 people (including the driver, depending on compensation), or transporting hazardous materials in quantities requiring the vehicle to be placarded. The requirements of Part 571 — specifically, the Federal Motor Vehicle Safety Standards — are applicable to all motor vehicles or items (parts and accessories) of the motor vehicle equipment that the manufacturer has completed. In general, any person whose duties involve the equipment of a carrier's transport motor vehicles, whether it be decision making, procurement, installation, maintenance, or other aspects, must share responsibility for compliance with the equipment requirements of Part 393. "Every employer and employee shall comply and be conversant with the requirements and specifications of this part..." (§393.1) Furthermore, a carrier is prohibited from operating or permitting to be operated, a motor vehicle unless it is properly equipped in accordance with these regulations. "No employer shall operate a commercial motor vehicle, or cause or permit it to be operated, unless it is equipped in accordance with the requirements and specifications of this part." (§393.1) With regard to Part 571, the responsibility for meeting the Federal Motor Vehicle Safety Standards (FMVSS) generally lies with the manufacturers of motor vehicles. However, in some cases where the effective date of individual standards is after the vehicles' manufacture date, the motor carrier or operator of the motor vehicle may be responsible (through retrofitting or other means) for ensuring that required safety standards are met. In general, vehicle owners and operators are required to make sure	

Vehicle Maintenance Pro

Notes

the vehicle continues to meet the FMVSS that were in effect at the time of vehicle manufacture.

In many cases, Part 393 will refer directly to Part 571 for technical compliance information. An example of this is the relationship between Subpart C of Part 393 (brakes) and §121 in Part 571 (also referred to as FMVSS 121). Part 393 requires that vehicles built with air-brake systems complying with §571.121 must continue to comply with §571.121 (you cannot modify the vehicle in such a way that it no longer complies with §571.121, or operate it in a condition that is not in compliance with §571.121).

Part 393 is rather technical and lengthy. For the sake of this section of the manual we will only summarize the subpart topics. The detailed regulations are available in the regulations portion of this manual.

Subpart A, General, provides the scope, applicability, and definitions used in the part.

Subpart B, Lighting devices, reflectors, and electrical equipment

This subpart provides the regulations for lights and reflectors, and the related equipment.

The first areas we will cover are roadway illumination and vehicle conspicuity (how noticeable the vehicle is). The purpose of the roadway illumination and vehicle conspicuity requirements are quite simple — to reduce traffic accidents, injuries, and death by providing adequate illumination of the roadway, and enhancing the visibility or attention-getting ability of motor vehicles on the road so that their presence is perceived and their signals are clearly understood by other motorists and pedestrians, in both daylight and darkness (or any other conditions that might reduce visibility).

Both Parts 393 and 571 address this area. In general, Part 393 specifies the quantity, color, location, and position of lighting and reflective devices on motor vehicles, while Part 571 lists the manufacturing specifications for original and replacement lamps (including bulbs), reflective devices, and all associated equipment. Part 571 also provides some technical data related to the location of some lights and reflectors. This is done by §393.11 referencing §571.108, using the statement that the vehicle must meet the applicable §571.108 standard that was in place at time of manufacture.

In general, all lamps must be securely attached and capable of being operated at all times (§393.9).

In addition, all lighting devices must meet the requirements of Part 571 and the associated Society of Automotive Engineers (SAE) standards (when referenced). The following is a list of the various lighting devices required by §393.11 and their specifications as described in §571.108.

Headlamps — Each truck and bus must be equipped with a headlighting system which conforms to the following requirements:

Compliance Management

Required motor vehicle headlighting systems						Notes
Headlamps for	Quantity & Color	Location	Position	Height above road measured (in inches) from center of lamp at curb weight	Applicable §571.108 standard	
Buses & Trucks Less Than 80" Wide	2 white (minimum) with an equal number on each side.	Front of vehicle.	On the front at the same height, an equal number at each side of the vertical centerline as far apart as possible.	Not less than 22" nor more than 54".	S10, Headlight system requirements	
Buses & Trucks 80" or More Wide					S10, Headlight system requirements	
Note 1: Headlamp beams must be adjustable both vertically and horizontally, and must provide for upper and lower distribution of light at the driver's will. Note 2: Fog and auxiliary lighting may be used in lieu of headlight system under conditions that make their use advisable, however, they cannot be considered as replacing the headlights. Turn signal lamps — Unless turn signals are so constructed (double-faced) and located as to be visible to passing motorists, two turn signals are required on the rear of a truck tractor — one at each side as far apart as practicable. In all cases, turn signal lamps must meet the following requirements:						
Required motor vehicle turn signal lamps						
Turn Signal Lamps for	Quantity & Color	Location	Position	Height above road measured (in inches) from center of lamp at curb weight	Applicable §571.108 standard	
Buses and Trucks Less Than 80" Wide	2 red or amber; 2 amber.	At or near front and rear of vehicle.	At or near the front — one amber on each side of the vertical centerline, at the same height, and as far apart as practicable.	Not less than 15" nor more than 83".	S7, Signal lamp requirements	
Buses and Trucks 80" or More Wide			On the rear — one red or amber on each side of the vertical centerline, at the same height, and as far apart as practicable.		S7, Signal lamp requirements	

Vehicle Maintenance Pro

Notes

Turn Signal Lamps for	Quantity & Color	Location	Position	Height above road measured (in inches) from center of lamp at curb weight	Applicable §571.108 standard
Trailers Less Than 80" Wide	2 red or amber.	Rear of vehicle.	On the rear — one red or amber on each side of the vertical centerline, at the same height, and as far apart as practicable.		S7, Signal lamp requirements
Trailers 80" or More Wide					S7, Signal lamp requirements

Note 1: Turn signal lamps must not be connected optically with either headlamps or other lighting devices that produce a greater intensity of light than the turn signal lamps.

Note 2: Turn signal lamps must not be combined with stop lamps unless the stop light function is deactivated when the turn signal function is activated.

Identification lamps — Identification lamps (ID markers) must meet the following requirements:

Required motor vehicle identification lamps

Identification Lamps for	Quantity & Color	Location	Position	Height above road measured (in inches) from center of lamp at curb weight	Applicable §571.108 standard
Buses and Trucks 80" or More Wide	3 amber.3 red.	Front and rear of vehicle.	On the front and rear — 3 lamps, amber in front, red in rear, as close as practicable to the top of the vehicle, at the same height, as close as practicable to the vertical centerline, with lamp centers spaced not less than 6" or more than 12" apart. The front lamps may be located as close as practicable to the top of the cab.	No requirement.	S7.5, Clearance and identification lamps

Compliance Management

Identification Lamps for	Quantity & Color	Location	Position	Height above road measured (in inches) from center of lamp at curb weight	Applicable §571.108 standard
Trailers 80" or More Wide	3 red.	Rear of vehicle.	On the rear — 3 lamps, amber in front, red in rear, as close as practicable to the top of the vehicle, at the same height, as close as practicable to the vertical centerline, with lamp centers spaced not less than 6" or more than 12" apart.		

Note: Identification lamps for vehicles over 80" in overall width may be mounted on the vertical centerline of the truck cab where different from the centerline of the vehicle, except where the cab is not more than 42 inches wide at the front roofline, then a single lamp at the center of the cab shall be deemed to comply with the requirements for identification lamps (see Footnote 1 to the table at §393.11). No part of the identification lamps or their mounting may extend below the top of the vehicle's windshield. Identification lamps are not required on vehicles under 80" wide.

Also, the regulations (§571.108) do not allow the placement of any other lamps in such a manner as to interfere with the purpose of the ID marker lamps. Any other lamps must be twice the distance from the outside ID lamps as the distance between the ID lamps. Example: If the ID markers are 6" apart, the other lamps must be at least 12" away from the outside ID markers.

Clearance lamps — Clearance lamps for vehicles 80" in overall width must meet the following requirements:

Notes

Vehicle Maintenance Pro

Notes

Required motor vehicle clearance lamps

Clearance Lamps for	Quantity & Color	Location	Position	Height above road measured (in inches) from center of lamp at curb weight	Applicable §571.108 standard
Buses, Trucks, and Trailers Less Than 80" Wide, and Buses, Trucks, and Trailers 80" or More Wide	2 amber.2 red.	Front and rear of vehicle.	On the front and rear — 3 lamps, amber in front, red in rear, to indicate overall width of the vehicle, one on each side of the vertical centerline, at the same height, and as near the top as practicable.	No requirement.	S7.5, Clearance and identification lamps

Note 1: In cases where the rear identification lamps are mounted at the extreme height of a vehicle, rear clearance lamps need not meet the requirements that they be located as close as practicable to the top of the vehicle.

Note 2: Clearance lamps must not combine optically with tail lamps or identification lamps.

Tail lamps — Tail lamps shall be activated when the headlamps are activated in a full intensity, steady-burning state and must meet the following requirements:

Required motor vehicle tail lamps

Tail Lamps for	Quantity & Color	Location	Position	Height above road measured (in inches) from center of lamp at curb weight	Applicable §571.108 standard
Buses, Trucks, and Trailers Less Than 80" Wide and Buses, Trucks, and Trailers 80" or More Wide	2 red.	Rear of vehicle.	On the rear, one lamp on each side of the vertical centerline, at the same height, and as far apart as practicable.	Both on the same level between 15" and 72".	S7.2, Taillamps

Stop lamps — Stop lamps shall activate upon application of the vehicle's service brakes and must meet the following requirements:

Compliance Management

Required motor vehicle stop lamps						Notes
Stop Lamps for	Quantity & Color	Location	Position	Height above road measured (in inches) from center of lamp at curb weight	Applicable §571.108 standard	
Buses, Trucks, and Trailers Less Than 80" Wide and Buses, Trucks, and Trailers 80" or More Wide	2 red.	Rear of vehicle.	On the rear, one lamp on each side of the vertical centerline, at the same height, and as far apart as practicable.	Both on the same level between 15" and 72".	S7.3, Stop lamps	

Side marker lamps — Side marker lamps must meet the following requirements:

Required motor vehicle side marker lamps					
Side Marker Lamps for	Quantity & Color	Location	Position	Height above road measured (in inches) from center of lamp at curb weight	Applicable §571.108 standard
Buses, Trucks, and Trailers Less Than 80" Wide	2 red.2 amber.	Side of vehicle.	On the side — One red as far to the rear as practicable, and one amber as far to the front as practicable.	Not less than 15". Rear marker on trailer: Not less than 15" and not more than 60".	S7.4, Side marker lamps
Buses, Trucks, and Trailers 80" or More Wide				Not less than 15". Rear marker on trailer: Not less than 15" and not more than 60". Rear side markers are not required on truck tractors.	

Note: If vehicle is 30' or more in length, one additional side marker lamp is required on each side, amber in color, located at or near the midpoint between front and rear side markers, not less than 15" above the road surface.

License plate lamps — License plate lamps must activate when the vehicle's headlamps are activated and must meet the following requirements:

Vehicle Maintenance Pro

Notes

Required motor vehicle license plate lamps

License Plate Lamps for	Quantity & Color	Location	Position	Height above road measured (in inches) from center of lamp at curb weight	Applicable §571.108 standard
Buses, Trucks, and Trailers Less Than 80" Wide and Buses, Trucks, and Trailers 80" or More Wide	1 white.	Rear of vehicle.	At rear license plate, so that the plate is illuminated from either the top or sides.	No requirement.	S7.7, License plate lamps

Note: Multiple license plate lamps and backup lamps may be used to fulfill the requirements of the SAE Standards applicable to same.

Hazard warning flasher lamps — Every bus, truck, and truck tractor is required to be equipped with a signaling system that, in addition to signaling turning movements, shall have a switch or combination of switches that will cause the two front turn signals and the two rear signals to flash simultaneously as a vehicular traffic signal warning. This warning system must be capable of flashing simultaneously with the ignition of the vehicle on or off and must meet the following requirements:

Required motor vehicle hazard warning flasher lamps

Hazard Warning Flasher Lamps for	Quantity & Color	Location	Position	Height above road measured (in inches) from center of lamp at curb weight	Applicable §571.108 standard
Buses and Trucks Less Than 80" Wide	2 amber.	At or near front and rear of vehicle.	At or near the front — one amber on each side of the vertical centerline, at the same height, and as far apart as practicable.	Not less than 15" nor more than 83".	S9.6, Vehicular hazard warning signal operating unit
Buses and Trucks 80" or More Wide			On the rear — one red or amber on each side of the vertical center-line, at the same height, and as far apart as practicable.		S9.6, Vehicular hazard warning signal operating unit

Compliance Management

Hazard Warning Flasher Lamps for	Quantity & Color	Location	Position	Height above road measured (in inches) from center of lamp at curb weight	Applicable §571.108 standard
Trailers Less Than 80" Wide	2 red or amber.	Rear of vehicle.	On the rear — one red or amber on each side of the vertical center line, at the same height, and as far apart as practicable.	Not less than 15" or more than 83".	S9.6, Vehicular hazard warning signal operating unit
Trailers 80" or More Wide					S9.6, Vehicular hazard warning signal operating unit

Backup lamps— Backup lamps are required to operate when the vehicle (bus, truck, or truck tractor) is in reverse and must meet the following requirements:

Required motor vehicle backup lamps

Backup Lamps for	Quantity & Color	Location	Position	Height above road measured (in inches) from center of lamp at curb weight	Applicable §571.108 standard
Buses and Trucks Less Than 80" Wide	1 white.	Rear of vehicle.	On the rear of vehicle.	No requirements.	S7.6, Backup lamps

Note 1: Backup lamps are not required on trailers.

Note 2: Multiple license plate lamps and backup lamps may be used to fulfill the requirements of the SAE Standards applicable to same.

Parking lamps — Parking lamps are for vehicles less than 80 inches in overall width and must meet the following requirements:

Notes

Vehicle Maintenance Pro

Notes

Required motor vehicle parking lamps

Parking Lamps for	Quantity & Color	Location	Position	Height above road measured (in inches) from center of lamp at curb weight	Applicable §571.108 standard
Buses and Trucks Less Than 80" Wide	2 amber or white.	Front of vehicle.	On the front - one on each side of the vertical centerline, at the same height, and as far apart as practicable.	Not less than 15", nor more than 83".	S7.8, Parking lamps

Conspicuity systems — The conspicuity system requirements were implemented to reduce traffic accidents, injuries, and death by enhancing vehicle visibility through the combined use of reflectors and retroreflective sheeting.

In general, these requirements apply to:

- Trailers of 80 inches or more in overall width, and with a gross vehicle weight rating (GVWR) over 10,000 lbs., manufactured on or after **December 1, 1993**;
- Trailers of 80 inches or more in overall width, and with a gross vehicle weight rating (GVWR) over 10,000 lbs., manufactured prior to **December 1, 1993**; and
- Truck tractors manufactured on or after **July 1, 1997**.

Retroreflective sheeting — Retroreflective sheeting consists of a smooth, flat, transparent exterior film covering a retroreflective element so as to form a non-exposed retroreflective optical system.

Retroreflective sheeting must conform to a specific pattern of red and white colors. This pattern must consist of:

Compliance Management

- alternating red and white segments with each being 300 mm $\pm$ 150 mm (12 inches $\pm$ 6 inches) in length;
- neither red nor white sheeting segments can represent more than two-thirds of the cumulative total of any continuous strip marking the width of a trailer, or any continuous or broken strip marking its length.

Exception: This pattern applies except when a segment must be trimmed to clear obstructions, or lengthened to provide red sheeting near red lamps.

Although retroreflective sheeting must conform to a specific pattern of alternating red and white colors, the width of the sheeting can vary (allowing for different equipment design and specifications). The three acceptable widths, or grades, of retroreflective sheeting are:

- Grade DOT-C2 shall be not less than 50 mm (2 inches) wide;
- Grade DOT-C3 shall be not less than 75 mm (3 inches) wide; and
- Grade DOT-C4 shall be not less than 100 mm (4 inches) wide.

Required motor vehicle retroreflective sheeting

Retro-reflective Sheeting for ↓	Color	Dimensions	Location	Height above road measured (in mm) from center of strip
Truck Tractors	Each sheet (strip) shall consist of an alternating pattern of red and white color segments.	Each color segment shall be 300 mm $\pm$ 150 mm (12 inches $\pm$ 6 inches) in length, and either 50 mm (2 inches), 75 mm (3 inches), or 100 mm (4 inches) wide.	Rear of vehicle as close to outer edge as practicable (see below).	Above the top of tires and not more than 1,525 mm (60 inches) at truck tractor unladen vehicle height.
Trailers 80" or More Wide and Weighing 10,000 lbs or More			Rear and sides of vehicle as close to outer edges as practicable (see below).	Not less than 375 mm (15 inches) and not more than 1,525 mm (60 inches) at trailer curb weight.

Location of retroreflective sheeting — Rear of truck tractor—There are 2 requirements, or **elements**, for applying retroreflective sheeting to the rear of a truck tractor. They are as follows:

Requirements of **Element 1** include:

- Two strips of retroreflective sheeting of not less than 600 mm (24 inches) in length, shall be applied (as close to the edges as practicable) to the rear fenders, mudflaps, or mudflap support brackets to mark the width of the truck tractor.

Notes

Vehicle Maintenance Pro

Notes

- These two retroreflective strips being applied as horizontally as practicable, in a vertical plane facing the rear of the vehicle on:
- The rear fender.
- The mudflap support brackets. On truck tractors fitted with temporary mudflap support brackets, the retroreflective strips shall be applied on the mudflaps or on plates that are transferable to permanent mudflap support brackets.
- The plates attached to the mudflap support brackets; or
- The mudflaps. Retroreflective strips applied on mudflaps shall be applied so that they are not lower than 300 mm (12 inches) below the upper horizontal edge of the mudflap.
- For truck tractors without mudflaps, the retroreflective strips may be applied outboard of the frame on brackets behind the rear axle or on brackets ahead of the rear axle and above the top of the tires (such as mounted to the back of the cab). If they are mounted directly or indirectly to the back of the cab, the elements must be as close to the outer edge as practicable, within 1,525 mm (60 inches) of the ground, and 75 percent of the strips must be visible (not blocked by other equipment parts or components).

Requirements of **Element 2** include:

- Two pairs of white retroreflective sheeting strips, with each pair consisting of strips 300 mm (12 inches) in length, shall be applied accordingly. One pair shall be applied horizontally and the other vertically to the right and left upper corners of the truck tractor cab, as close to the top of the cab and as far apart as practicable.
- These two pairs of white retroreflective sheeting strips shall be applied so that a minimum of 75 percent of their area may be seen.
- If the rear window of the cab is so large as to occupy all the space, the strips may be applied directly to the edge of the window.

Location of retroreflective sheeting — Rear of trailer — There are 3 requirements, or **elements**, for applying retroreflective sheeting to the rear of a trailer. They are as follows:

Requirements of **Element 1** include: a single strip of retroreflective sheeting (in alternating red and white colors) shall be applied horizontally to the full width of the trailer, and as close as possible to the extreme edges. This strip shall be not less than 375 mm (15 inches) and no more than 1,525 mm (60 inches) above the road surface at the strip's centerline with the trailer at curb weight.

Requirements of **Element 2** include: two pairs of white retroreflective sheeting strips, with each pair consisting of strips 300 mm (12 inches) in length, shall be applied accordingly. One pair shall be applied horizontally and the other vertically to the right and left upper contours of the trailer and as far apart as practicable.

Compliance Management

If the perimeter of the trailer is not rectangular, the retroreflective strips may be applied along the perimeter, as close as possible to the uppermost and outermost edges on the left and right sides (as viewed from the rear).

Requirements of **Element 3** include: a single strip of retroreflective sheeting (in alternating red and white colors) shall be applied to the full width of the horizontal member of the rear underride protection device.

Location of retroreflective sheeting — Sides of trailer — Retroreflective sheeting applied to sides of trailers must conform to the following requirements. It must:

- Be applied as horizontally as possible in alternating red and white colors;
- Start and end as close to the front and rear of the trailer as possible. Retroreflective sheeting applied to sides of trailers need not be in a continuous strip, as long as 50 percent or more of the length of the trailer is covered and the spaces are distributed as evenly as possible.
- Be not less than 375 mm (15 inches) and not more than 1,525 mm (60 inches) above the road surface at the strip's centerline with the trailer at curb weight.
- Be applied in such a way (if necessary) to clear rivet heads or other obstructions, as long as any separation of stripping is of the same color and no more than 25 mm (1 inch) apart.
- The retroreflective strip shall be in a location on the sides of trailers so that it shall not be obscured in whole or in part by any part of the motor vehicle equipment or trailer cargo.

On **March 31, 1999** the Federal Highway Administration (FHWA, the agency that handled the motor carrier regulations before FMCSA) published a final rule amending Part 393 of the Federal Motor Carrier Safety Regulations (FMCSR) — creating Sec. 393.13; **Retroreflective sheeting and reflex reflectors, requirements for semitrailers and trailers manufactured before December 1, 1993.**

This amendment requires interstate motor carriers to retrofit the sides and rear of all semitrailers and trailers manufactured prior to December 1, 1993, with either retroreflective sheeting (conspicuity tape) or reflex reflectors.

Sec. 393.13 applies to semitrailers and trailers that have an overall width of 80 inches (2,032 mm), and a gross vehicle weight rating (GVWR) of 10,001 pounds (4,536 kg) or more, and was effective as of June 1, 1999.

The retroreflective sheeting must conform to the same requirements as trailers manufactured on or after December 1, 1993 (see **Retroreflective Sheeting** and **Location of Retroreflective Sheeting — Rear & Sides of Trailer** above).

The amendment required interstate motor carriers to retrofit trailers within 2 years of the June 1, 1999 effective date (**June 1, 2001**) if the semitrailers and trailers **did not have** a retroreflective sheeting or reflex reflector system, and within 10 years of the June 1 effective date (**June 1, 2009**) if the semitrailers and trailers had a conspicuity treatments that

Notes

Vehicle Maintenance Pro

Notes

did not conform to the requirements of the final rule (the red and white conspicuity systems).

The reason for the extended period was that some motor carriers had been voluntarily using conspicuity treatments on their trailers built before December 1, 1993, that differed in color schemes and area coverage, as well as levels of sheeting reflectivity, from the requirements for trailers manufactured on or after December 1, 1993 (see Federal Motor Vehicle Safety Standard No. 108, 49 CFR 571.108, S5.7).

Making these carriers conform to the requirements within the 2-year phase-in period would penalize them for being proactive in their safety efforts. Therefore, carriers that demonstrated an extra level of safety consciousness by voluntarily fitting their trailers with retroreflective sheeting in advance of the rule, were given 10 years to replace the alternative conspicuity treatments with ones complying to the new rule.

As June 1, 2009 has since passed, all trailers in operation that require the conspicuity systems (including ones built previous to December 1, 1993) should now be equipped with the standard retroreflective sheeting/reflectors.

Reflex reflectors

Reflex reflectors must meet the following requirements:

Required motor vehicle reflex reflectors

Reflex Reflectors for	Quantity & Color	Location	Position	Height above road measured (in inches) from center of lamp at curb weight	Applicable §571.108 standard
Buses, Trucks, and Trailers Less Than 80" Wide	4 red, 2 amber.	Rear and each side of vehicle.	On the rear - one on each side of the vertical centerline, at the same height, and as far apart as practicable.	Not less than 15" and not more than 60".	S8.1, Reflex reflectors
Buses, Trucks, and Trailers 80" or More Wide			On the side - One red as far to the rear as practicable, and one amber as far to the front as practicable.		

Note 1: A trailer that is less than 30 inches in overall length, including the trailer tongue, need not be equipped with front side reflex reflectors.

Note 2: If trailer is 30' or more in length, one on each side, located at or near the midpoint between front and rear side markers.

Compliance Management

Associated equipment — In general, the requirements for equipment associated with vehicle lighting and electrical systems all concern safety and the prevention of accidents and fires caused by lighting or electrical system failures.

The electrical requirements, other than for lighting requirements discussed above, are primarily protective in nature. They are protective against failure and disruption of electrical service, and protective against accidents. The following examples illustrate these requirements, and are given here as reminders to those with responsibility for proper equipping of motor vehicles.

Wiring should be grouped and protected against abrasion by coverings like nonmetallic tape, braid, metal sheathing or tubing. When passing through holes, the holes should be rolled or bushed with a suitable material. In addition, wiring should be properly supported and protected against overheating and becoming enmeshed in moving parts.

Unless storage batteries are located in the engine compartment, they must be covered by a fixed part of the vehicle or a removable cover or enclosure. It is especially important when the battery and a fuel tank are located in a common compartment or area, that they be partitioned from each other and that each compartment have an independent cover, ventilation and drainage.

Current to all low tension circuits must pass through overload protection devices, except battery to starter or battery to generator, horn, and electrically-operated fuel pump and brake circuits. Headlight circuits must not be affected by short circuits in other lighting circuits or they must be protected by an automatic reset overload circuit breaker.

Passenger-carrying vehicles have stricter roadside inspection requirements when it comes to “electrical cables” (high wattage power lines that are normally not overload protected). This requirement is in place to reduce the risk of vehicle fires in the passenger-carrying vehicles. Therefore, your maintenance inspections should be more detailed when it comes to these electrical cables. Any chafing, rubbing, missing grommet, broken or unsecure connection, or loose electrical cable should immediately be repaired (this is a good policy to have no matter what type of commercial vehicle you operate!).

All electrical wiring between towing and towed vehicles shall be contained in substantially constructed protective devices, and shall have suitable detachable connections so as to afford reasonable assurance against incorrect connection or accidental disconnection.

This discussion of lighting, reflectors and other associated equipment is intended only to serve as an overview of the regulations. For complete details, the regulations in the regulations portion of this manual should be consulted.

Subpart C, Brakes

Subpart C, Brakes, provides the requirements for brakes. The first regulations of interest are §393.42 and .48, which require work brakes on all wheels that meet the standards set down in FMCSA Part 393 and

Notes

Vehicle Maintenance Pro

Notes

FMVSS Part 571. There are a few exceptions (lift axles that are not contacting the ground, very old vehicles, specialized vehicles, trailers weighing less than 3,000 pounds, etc.), but basically all wheels that are on the ground must have working brakes.

In §393.43 the regulations require that any towed vehicle have brakes that will automatically engage in the event of a breakaway. This regulation applies to all towed units that must have brakes. In §393.47 the FMCSA provides the freeplay limits for brake adjusters (sometimes referred to as the “readjustment limits”).

The design and condition of brake components are also covered in Subpart B. If a brake component does not comply with the requirements in Subpart B, the vehicle is in violation. Here are a few key regulations that seem to generate a lot of discussion.

Automatic slack adjusters — As of October 1993 for hydraulic brake systems and October 1994 for air brake systems, brakes on new vehicles are required to be equipped with slack adjusters that automatically adjust as the brake linings and drums wear. If the vehicle was built with automatic slack adjusters, they cannot be removed and replaced with manual slack adjusters.

Antilock braking systems — In March 1995, NHTSA issued rules requiring antilock brake systems (ABS) for heavy trucks, tractors, trailers, and buses. Specifically these rules require:

- All new truck tractors manufactured on or after March 1, 1997, must be equipped with ABS;
- All new air-braked trailers and single-unit trucks and buses manufactured on or after March 1, 1998, must be equipped with ABS; and
- All new single-unit trucks and buses with hydraulic brakes manufactured on or after March 1, 1999, must be equipped with ABS.

The standard for air-brake equipped tractors requires antilock control on the front axle and at least one rear axle. On at least one of the tractor axles, each wheel must be independently controlled by an antilock modulator. This ensures that a wheel provides shorter stopping distances and optimal braking force on all surfaces, especially on road surfaces where one side is more slippery than the other.

For air-brake equipped semi trailers, at least one axle must have ABS. Full trailers must have ABS for at least one front and one rear axle. All air-brake equipped trailers manufactured after March 1, 1998, must be equipped with an ABS malfunction warning light, and all trailers manufactured after March 1, 2001, must be equipped with an electrical circuit that is capable of signaling a malfunction in the trailer’s antilock brake system to the towing vehicle.

Well-maintained, operational ABS is vital to a motor carrier. Consider the following facts:

- In tests, it took larger trucks 47 percent farther to stop on a dry surface as compared to a passenger car.
- On surfaces which were wet or slippery, the comparison between larger trucks and passenger cars was even greater.

Compliance Management

- Tractor-trailer combinations have the potential for loss of control and jackknifing in both dry and wet conditions.

Finally, if the vehicle was built with ABS, the regulations require that the ABS be maintained.

Brake distance reduction — Due to an update to the FMVSS 121 standards (§571.121) passed in 2009, the vast majority of new heavy truck tractors will have to achieve a 30 percent reduction in stopping distance compared to the truck-tractors currently in service at that time. New truck-tractors traveling at 60 miles per hour will be required to stop in 250 feet or less, when pulling a test trailer and loaded to their gross vehicle weight rating. For a small number of very heavy-duty tractors (severe-service tractors), the stopping distance requirement will be 310 feet or less under the same conditions. In addition, this new standard requires that all truck-tractors must stop within 235 feet when at their “lightly loaded vehicle weight” (bobtail).

When this new standard goes into effect, it will affect approximately 99 percent of the truck-tractors sold in the United States.

According to the DOT there are a number of simple and effective manufacturing solutions that vehicle manufacturers can use to meet the requirements of this new standard. These solutions include the installation of enhanced drum brakes, air disc brakes, or hybrid disc/drum systems. The DOT noted that a number of vehicles being built when the rule was passed were already meeting the performance requirements of the new standard.

This new standard went into effect on November 24, 2009. However, truck manufacturers had until August 1, 2011, to come into compliance with the regulations when building three-axle tractors with a GVWR of 59,600 pounds or less. Two-axle tractors and tractors with a GVWR above 59,600 pounds had until August 1, 2013, to meet the new standards.

The goal with updating this standard is to reduce the number of fatalities and injuries by reducing the number of crashes involving tractor-trailers and other vehicles. In addition, the DOT believes that this new standard will reduce the severity of injuries and significantly reduce the amount of property damage in crashes involving truck-tractors (better braking should result in lower accident speeds when an accident does happen).

Maintenance Pros need to be prepared to retrain technicians and develop the parts management practices necessary to support these newer brake systems when they begin arriving on the new vehicles purchased by the fleet. Also, be aware of the “tie-in” between FMVSS 121 and Part 393. According to Part 393, the vehicle must be maintained such that it continues to comply with the §571.121 standards that were in effect when the vehicle was manufactured (this prohibits “modifying” the vehicle to an “older, but easier to maintain” brake system after purchase).

The rest of Part 393

Subpart D, Glazing and window construction provides the requirements for windshield and other windows. This section also discusses what is allowed as far as tinting, damage, and obstructions when it comes to

Notes

Vehicle Maintenance Pro

Notes

the windshield. The bottom line is that nothing is allowed to be in the “critical area” of the windshield, which extends from the top of the steering wheel to a border two inches from the top of the windshield, and side to side from a border one inch from the windshield post to a border one inch from the windshield post. The only exceptions are government issued transponders and stickers (and they must be correctly placed), and minor damage meeting the exceptions provided in the regulations (damage that can be covered by a ¾ inch disk, provided it is not two intersecting cracks).

Section 393.62 of this subpart contains the requirements for emergency exits on buses. This is another section that references the FMVSS requirements. This section requires that the vehicle continue to meet the FMVSS 217 standards (§571.217) that were in place when the vehicle was manufactured, if the bus was manufactured after September 1, 1994. These standards establish the operating forces, opening dimensions, and markings for bus emergency exits.

Subpart E, Fuel system lists the regulations for all types of fuel systems including liquid, compressed natural gas, and compressed petroleum gas. This part includes a reference to §571.304, which has additional requirements on vehicles using compressed or liquified natural gas (CNG or LNG) fuels. These requirements include making sure the tank area is marked with a decal informing the vehicle owner and operator of the 36,000 mile or annual (whichever comes first) tank inspection requirement.

There are common requirements for all fuel systems, including:

- The fuel tank must be securely mounted to the vehicle and the cap must be in place and secure.
- The fuel lines and fittings must be adequate, long enough to allow for vehicle flexing, secured, not rubbing, protected if routed below the vehicle, and tight.
- The fuel tank, lines, and fittings cannot be leaking fuel.

If you are considering switching to an alternate fuel vehicle, there are several considerations. First, you will need to get at least some of your technicians trained to inspect and maintain the fuel system (some OEM and parts suppliers provide the training). Second, you will need to begin stocking parts for the systems. Finally, you will need to establish a preventive maintenance inspection schedule for the fuel system. Discussing the specifications and maintenance requirements with the system provider (OEM or parts supplier) can provide insight into the inspection and parts requirements. Also, do not forget that your technicians (and drivers!) will need to be trained on safely fueling these vehicles and how to handle any fuel-related incidents.

Subpart F, Coupling devices provides the regulations on systems used to connect (couple) commercial vehicles together. It is broken into two sections, one for “driveaway/towaway” vehicles (which involves piggybacking and tow-bar towing other vehicles) and one for vehicles using standard coupling devices to pull trailers (fifth-wheels, pintle hooks, bumper hitches, etc.).

Compliance Management

Subpart G, Miscellaneous parts and accessories covers a wide range of vehicle components (tires, wipers, speedometer, exhaust, bus drive shaft protections, bus seating and standing location prohibitions, etc.) that are not covered elsewhere in Part 393. Section 393.75, the tire requirements, is a section that should be read carefully. Many recommended and best practices have been confused with the regulations over the years. Make sure to read the actual regulation to know which is which.

Also in this subpart (at §393.86) are the rear end protection requirements (the rear bumper requirements). These requirements vary based on vehicle type and year of manufacture, so this is another section that should be read carefully.

Subpart H, Emergency equipment specifies what emergency equipment a commercial motor vehicle must carry (three warning devices, a 5 B:C or 10 B:C extinguisher, spare fuses for any circuit that uses fuses and powers a required accessory).

Subpart I, Protection against shifting and falling cargo is a rather lengthy subpart, providing both the general cargo securement requirements as well as specific commodity securement requirements for “high risk” commodities such as metal coils, concrete pipe, and large rolls of paper.

The Maintenance Pro will only become directly concerned with this subpart when conducting FMCSA-required periodic inspections, as cargo securement is a portion of the periodic (annual) inspection.

Subpart J is the last subpart and contains the regulations pertaining to frames, cabs, wheels, steering, and suspensions.

Speed limiting

While not part of the FMCSA regulations on parts and accessories, speed limiters are a compliance issue Maintenance Pros need to become familiar with. Presently, two Canadian provinces (Ontario and Quebec) have speed limiter regulations. In the United States several major trucking associations and motor carriers, and several safety organizations have petitioned the United States Department of Transportation to consider similar regulations.

The regulations in Ontario and Quebec require all heavy trucks (defined as a truck over 11,000 kilograms, or roughly 24,250 pounds) built after 1995 be limited to a maximum speed of 105 kilometers per hour (roughly 65 miles per hour). The regulations also require that as much as is practical the speed limiter be tamperproof. Once it is set at the appropriate speed, the driver is not to have the ability to alter it.

Carriers are responsible for compliance with these regulations. Carriers that have the technical know-how and correct equipment (hardware and software) should be able to do the programming themselves. If the carrier does not have the know-how or equipment, the programming will need to be done at a dealer or repair facility that has the correct capabilities.

Compliance is primarily verified through speeding citations. If a driver is operating in excess of 105 kilometers per hour, the carrier can be cited for violating the speed limiting law. Note: If the driver was operating over

Notes

Vehicle Maintenance Pro

Notes

the posted speed limit on the roadway, the driver will receive a speeding ticket in addition to the company being cited for violating the speed limiting regulation. However, some officers will be provided systems that can allow the viewing of the vehicle's electronic settings (including checking if the vehicle component settings have been tampered with, changing the actual versus vehicle reported speed, as well as the speed limiter settings).

One key point Maintenance Pros need to be aware of is these regulations apply to every heavy truck (built after 1995) operating in Ontario and Quebec, **regardless of where the vehicle is registered**. Trucks entering Ontario and Quebec from other provinces or the United States must comply with these regulations upon entering these provinces.

Part 396 — Inspection, Repair, and Maintenance

Part 396 concerns itself directly with the safety of your commercial motor vehicles. Part 396 is relatively small, containing only 13 sections and no subparts.

However, as the Maintenance Pro you need to:

- Develop a thorough understanding of the important requirements of Part 396; and
- Incorporate adequate management controls to ensure compliance and the safety of your vehicles.

§396.3 Inspection, repair, and maintenance, states that you must have in place a *systematic* method of inspecting, repairing, and maintaining your CMVs, and that all safety-related parts and accessories must be in safe and proper operating condition at all times. It also requires that the pushout windows, emergency doors, and emergency exit marking and lighting on buses be inspected by the company at least every 90 days.

§396.3 also lists the maintenance record retention requirements. For each CMV you control (operate) for 30 consecutive days or more, you must create a file that contains the following:

- An identification of the vehicle including:
 - Your company-assigned vehicle number (if so marked),
 - Owner of the vehicle if not company owned,
 - Make,
 - Serial number,
 - Year, and
 - Tire size.
- A means to indicate the nature and due date of the various inspection and maintenance operations to be performed (the preventive maintenance schedule for the vehicle); and
- A record of inspections, repairs, and maintenance indicating their date and nature (work orders generated for the vehicle), including

Compliance Management

records of all emergency exit inspections (for passenger-carrying vehicles).

The records of inspections, repairs, and maintenance generally must be retained where the vehicle is either housed or maintained for a period of 1 year, and for 6 months after the motor vehicle leaves your control. The exceptions to this are:

- Records relating to an engine change. Appendix A to Part 379 requires records pertaining to an engine change be maintained by the carrier for three years after disposal of the equipment.
- Records relating to a roadside inspection. These must be kept for 12 months.
- DVIR forms. These must be kept for three months.
- Records of periodic (annual) inspections. These reports must be kept for 14 months.

Many carriers retain some or all of these records for the entire time the vehicle is in service, and then for the additional six months. In the Determining Maintenance Schedules and Recordkeeping sections we discussed the value of having long-term records available for review, as well as the process for establishing your maintenance schedules. During an audit you will be judged on how well you have followed the maintenance schedule you have established (based on these records) and the results of roadside inspections your vehicles have undergone over the last year.

The retention of all repair/work orders and receipts from vendor repairs (provided the receipts detail the repairs) is all that is needed to comply

Notes

Vehicle Maintenance Pro

Reserved

Compliance Management

with this regulation. If you are retaining records for operational purposes, chances are you will far exceed the regulatory requirements. Simply check that the records you are generating and retaining in the course of operating the maintenance shop contain the required information.

As of December 2008 (effective December 2009), intermodal equipment providers will also be subject to these regulations. This regulatory change will require drivers at carriers that use intermodal chassis to inspect and report on any safety problems to the provider. If defects are found, the driver cannot operate the chassis until it is repaired when taking custody of it. When returning it, the driver must provide a written report reporting the condition of the chassis to the provider, if there is a defect. Intermodal equipment providers must also have a systematic inspection and maintenance program for all chassis, and be maintaining records of all inspections and maintenance (including driver inspections).

§396.9 Inspection of motor vehicles in operation, is the regulation that provides agents of the FMCSA with the authority to perform inspections of your vehicles while in operation — being driven on a *highway*. As you may recall from our earlier discussion, a highway is any place to which the motoring public has unrestricted access.

This regulation also authorizes these same agents to declare a vehicle *out of service* if they believe continued operation of the vehicle is likely to cause an accident or breakdown due to a safety-related defect or deficiency.

If placed out of service, the vehicle cannot be operated again until all out-of-service defects and deficiencies have been repaired.

The inspections are generally performed by state troopers or motor carrier enforcement officers who work for the states. Upon completion of the inspection, one copy of the report is presented to the driver and another is sent to the FMCSA and placed on file. There are six basic inspections the officers will perform on a driver and/or vehicle. They are:

Level I — This is the most comprehensive inspection. It includes an inspection of all vehicle components and the driver's credentials and condition.

Level II — This is basically the same as a Level I inspection, with the exception that the officer does not check anything that requires going under the vehicle. It is referred to as a "walk-around" inspection (not to be confused with a driver's walk-around inspection).

Level III — The Level III inspection consists of a check of the driver's credentials and condition only.

Level IV — This inspection is referred to as a "special inspection." These are either done as part of a larger program to verify or refute specific trends at the national level or as part of a local or regional "crack-down" on specific problems. A brake-only inspection done as part of Operation Brake Check, which is conducted annually to check the status of truck brake systems on the road, would be an example of a Level IV inspection.

Level V — A Level V inspection is a vehicle-only inspection consisting of the same vehicle components as a Level I inspection. This is normally done either at a carrier's facility or on the road in situations where the

Notes

Vehicle Maintenance Pro

Notes

driver is not available. An example of this would be an inspection following a crash where the driver was injured.

Level VI — Level VI inspections are done only on vehicles transporting certain radioactive materials. It is an in-depth Level I inspection with tougher criteria for passing.

Roadside inspections are conducted at scales, inspection sites, or literally on the roadside to determine if drivers and vehicles are in compliance with the regulations. The inspector is verifying that the vehicle meets the requirements established in Part 393. If the driver or vehicle is in a condition that could be deemed unsafe (likely to cause an accident or breakdown) the driver and/or vehicle can be placed out of service. The decision on whether the vehicle is likely to cause an accident or breakdown is based on the Commercial Vehicle Safety Alliance (CVSA) North American Out-of-Service Criteria, which is updated every April.

If the vehicle is placed out of service, the vehicle cannot be operated on the highway until it is back into compliance. The officer issuing the out-of-service order will normally review the vehicle before lifting the out-of-service order to assure compliance has been met. If the driver is placed out of service, the driver may not operate any commercial vehicle until he/she is back into compliance.

The bottom line is if the vehicle was placed out of service it must be repaired *before being operated on the roadway*. The vehicle cannot even be driven to a repair facility. This will require road service being sent to the vehicle to make the necessary repairs. The only other option is to have the vehicle towed to a repair facility by a vehicle that is designed to tow other vehicles and is equipped with a crane or hoist.

If an out-of-service driver operates a commercial motor vehicle, or a vehicle that is out of service is moved before it is repaired, it is considered a violation of an out-of-service order, which is a very serious violation.

Note: Fines for violating an out-of-service order range from **\$1,100-\$2,750** for drivers, and **\$2,750-\$16,000** for employers and equipment providers, and can lead to a driver being disqualified. ***Do not allow anyone to operate the vehicle until the repairs are completed, and you have documentation proving that the repairs were done!*** In some cases the driver may be able to perform the repairs. If so, have the driver document the repairs and have the inspecting officer sign off on the inspection report before the vehicle leaves the inspection site.

In cases where violations are noted on the inspection form, but the driver or equipment were not placed out of service, corrective action must be taken as soon as possible, but the vehicle can be operated by the driver.

Generally, when one of your drivers undergoes a roadside inspection, the inspecting officer will complete an inspection report known as an ASPEN report or a MCS-63.

Compliance Management

To sum it up, federal regulations, specifically 49 CFR Part 396.9(d), require the driver to submit the inspection report to the carrier. This must be done even if the inspection is passed with no violations. The carrier must then review it, sign it, indicate that all violations listed have been corrected, and return it to the issuing agency within 15 days. A copy of the report must be kept at the carrier's place of business for one year following the inspection. Here is a step-by-step summary of the inspection process:

- The driver is not to operate a vehicle that has been placed out of service until it is repaired and back into compliance, and you have documentation that proves the repairs took place.
- The driver shall deliver the report to the company upon arrival at the next terminal or facility.
- If the driver is not scheduled to arrive at a terminal or facility within 24 hours, he or she shall immediately mail the report to the company.
- The company shall correct any unresolved violations noted. Repairs should be done before the vehicle is dispatched on to its next run. If the inspection report included a chassis provided by an intermodal equipment provider, the carrier is to forward a copy of the inspection to the intermodal equipment provider.
- A motor carrier official (or an official at the intermodal equipment provider if a violation noted involved an intermodal chassis provided to the carrier) is to certify on the form that violations have been corrected and mail the completed form to the address shown. This must be done within 15 days following the date of the inspection. Documentation proving the repair of out-of-service violations should be kept in the vehicle maintenance records (carriers and providers are required under §396.3 to either keep records, or see that the records are kept and available at time of audit).

Many times this function is handled by operations or safety personnel. The Maintenance Pro needs to be included in this process. As the Maintenance Pro it will be up to you to track the vehicle violations and out-of-service orders to make sure required repairs are being performed. Also, you will want to keep an eye on trends. If a certain type of vehicle is repeatedly receiving violations for brakes out of adjustment, you may want to see if there is a systemic problem with that type of brake and/or change the preventive maintenance scheduling for the vehicles equipped with those brakes.

Presently, there are more than 3,500,000 roadside inspections conducted annually by state and federal inspectors. Federal grants through the Motor Carrier Safety Assistance Program (MCSAP) have increased funding to the states for safety inspection purposes over the years. States have banded together to form the CVSA, the organization that oversees the out-of-service standards and sees to the uniformity and reciprocity of inspections conducted by state and federal inspectors.

Notes

Vehicle Maintenance Pro

Notes

CSA

CSA and roadside inspections. When the FMCSA receives its copy of the inspection report, the information on it is entered into the MCMIS (Motor Carrier Management Information System) database. The data is then used by the CSA (Compliance, Safety, Accountability) carrier tracking system, the Safety Measurement System, or SMS, to measure carrier performance in seven key areas, referred to as “Behavior Analysis and Safety Improvement Categories” or BASICS.

Data from the CSA SMS also feeds the Inspection Selection System (ISS). The ISS is a decision-making aid for officers on the road. It is used as part of the selection criteria when deciding who to inspect. If a carrier has a high score in one of the BASICS, it will also have a high ISS score. This will result in the carrier being “flagged” as “Optional” or “Inspect” in the ISS. If an officer enters the carrier’s DOT number into the ISS, the officer will see the inspect recommendation. This will lead to the carrier seeing significantly more roadside inspections.

Other inspection selection criteria includes drivers and/or vehicles with obvious violations, driver committing a traffic violation while driving, and random selection.

One critical difference between CSA and its predecessor systems is that DRIVERS are now tracked, measured, and evaluated by the system. In the CSA system there is a Driver Safety Measurement System that tracks drivers independent of the carriers. The system is nearly identical to the carrier systems, with the only major difference being what is done with drivers that do not score well (carrier and driver “evaluations” and “interventions” are different).

Safety Measurement

In CSA, all safety-related violations noted on roadside inspection reports count against a carrier’s and driver’s score in the Safety Measurement Systems. In the past the FMCSA has only looked at out-of-service violations when evaluating carriers (and they did not evaluate drivers).

Carrier and driver data is viewed and judged in seven narrow BASICS. Here are the seven BASICS and the associated regulations areas:

- Unsafe Driving (Parts 392, 397, and local traffic laws)
- Hours-of-Service (HOS) Compliance (Parts 392 and 395)
- Driver Fitness (Parts 383 and 391)
- Controlled Substances/Alcohol (Part 382 and 392)
- Vehicle Maintenance (Parts 393 and 396)
- Hazardous Materials (HM) Compliance (the hazardous materials regulations in Parts 171 to 180, and 397)
- Crash Indicator

Just an FYI: The Vehicle Maintenance BASIC includes all vehicle-related issues, including cargo securement.

Compliance Management

The way the BASICS function is that whenever an inspection, violation, or crash is entered into the FMCSA data system, CSA's SMS assigns the event to the correct BASIC. This assignment is done based on the type of inspection (driver and/or vehicle), regulation number that was violated (if there was a violation), and whether or not the event was a crash.

Driver inspections (Level 1, 2, 3, and 6 inspections) are placed in the HOS Compliance, Driver Fitness, and Controlled Substances and Alcohol BASICS. Vehicle inspections (Level 1, 2, 5, and 6 inspections) are placed in the Vehicle Maintenance BASIC. HM inspections are placed in the HM Compliance BASIC.

For CSA purposes, a "HM inspection" in the HM Compliance BASIC is one in which the vehicle was or should have been placarded at the time of the inspection. The CSA system methodology also refers to these as "placardable inspections."

The Unsafe Driving BASIC is slightly different (it does not use all driver inspections). Inspections that include an Unsafe Driving violation are placed in the Unsafe Driving BASIC, along with the violation.

The DOT-recordable crashes reported to the FMCSA by law enforcement are what are placed into the Crash BASIC. Fault or preventability are not considered. All crashes reported to the FMCSA by law enforcement are simply placed into the Crash BASIC for scoring.

Just an FYI, the reason Unsafe Driving and Crash BASICS are different is that they use a different measuring and scoring methodology. These BASIC use the number of power units a carrier operates multiplied by a utilization factor that considers the carrier's mileage per power unit when calculating the carrier measures and scores (the other BASICS use the relevant inspections in the measuring and scoring processes).

As far as placing violations into the correct BASIC, this is done by the specific regulations involved. If a roadside inspection report notes a violation of "\$393.11 Required Light inoperable," the system will place the violation into the Vehicle Maintenance BASIC.

ONE KEY POINT HERE: Violations noted on roadside inspection reports and violations discovered during auditing are what are tracked and used in the CSA Safety Measurement System. This has nothing to do with whether the driver or company received a "citation" or "ticket," or if the driver or vehicle were placed out of service. If an officer conducts an inspection, the officer will note any violations of the regulations that are discovered during the inspection on the roadside inspection report. These violations are what end up in the CSA Safety Measurement Systems. Once the inspection is complete, the officer will then decide if the violations that were discovered are serious enough to warrant issuing a formal warning or citation (ticket), and/or placing the vehicle or driver out-of-service.

No matter what the officer decided to do as far as issuing a formal warning or citation, or placing the vehicle out of service, the violations that were noted on the roadside inspection report will show up in the CSA Safety Measurement System.

Notes

Vehicle Maintenance Pro

Notes

When the violations from roadside inspection reports and crashes enter the system, they are “severity and time weighted.” The severity weighting for each violation is based on the violation’s relationship to crashes. Violations that have a close relationship to crashes have a higher value (as high as 10), while violations that have a lower association to crashes are given a low severity weight (as low as 1). If the violation was in the HOS Compliance, Driver Fitness, Vehicle Maintenance, or HM Compliance BASIC and resulted in the driver or vehicle being placed out of service, the severity is automatically increased by 2. Here are the severity weighting tables used by the FMCSA in the Vehicle Maintenance BASIC:

Vehicle maintenance BASIC violation severity table

Section	Description	Group	Severity*	Affects Driver Score?
385.103(c)	Fail to display current CVSA decal — Provisional Authority	Inspection Reports	4	N
392.2WC	Wheel (mud) flaps missing or defective	Windshield/Glass/Markings	1	Y
392.7	No pre-trip inspection	Inspection Reports	4	Y
392.7(a)	Driver failing to conduct pre-trip inspection	Inspection Reports	4	Y
392.7(b)	Driver failing to conduct a pre-trip inspection of intermodal equipment	Inspection Reports	4	Y
392.8	Failing to inspect/use emergency equipment	Emergency Equipment	2	Y
392.9	Failing to secure load	General Securement	1	Y
392.9(a)	Failing to secure load	General Securement	1	Y

399.207	Vehicle access requirements violations	Cab, Body, Frame	2	N
399.211	Inadequate maintenance of driver access	Cab, Body, Frame	2	N

*Severity is increased by 2 if the violation results in an out-of-service order.

†This violation is expected to be removed from the scoring system at a later time based on regulatory changes.

There are two “safeties” built into the system. First, one inspection cannot put more than 30 “severity points” into a BASIC. Second, if a violation repeats on an inspection (such as brakes out of adjustment), the violation is only counted once. These are in place because the system is looking for

Notes

Vehicle Maintenance Pro

Notes

carriers that have a history of violations, not a carrier that has one really bad inspection.

Crashes are also severity weighted, depending on the severity of the crash. If the crash involved an injury or fatality, the crash is given a severity weight of 2. If the crash involved no injuries or fatalities, but a vehicle had to be towed away from the scene, the crash is given a severity of 1. If any crash involved the release of a hazardous material (other than motor fuel), the severity is increased by 1. Here is a table that summarizes the crash severity weighting system:

Crash Type	Crash Severity Weight
Involves tow-away but no injury or fatality	1
Involves injury or fatality	2
Involves a hazmat release	Crash Severity Weight (from above) + 1

Once the severity weight has been determined for a violation, the next step is to “time weight” the violation or crash. Time weighting rewards or punishes carriers and drivers for more recent activity. Violations or crashes that took place in the last six months are given a time weighting of 3. If the violation or crash took place between 6 and 12 months ago, the time weighting is 2. If the violation or crash took place more than a year ago, the time weighting is one. Violations and crashes are used to calculate the carrier’s score for two years, and the driver’s for three years. Here is a table that shows the time weighting (driver time weighting is slightly different):

Event took place...	Time weight
Within the last 6 months	3
6 to 12 months ago	2
12 or more months ago	1

Violations that occurred more than 24 months ago are not used in the scoring.

To determine the full value of a violation simply multiply the total violation severity value (the severity value plus two for being placed out of service, if applicable) by the time weighting.

Once per month, carriers and drivers are scored in each BASIC. The BASIC scoring process involves first adding up all the severity and time weighted events in the BASIC.

To begin scoring carriers, this total is then divided by a “normalizing factor.” In the Unsafe Driving and Crash BASICs, the total is divided by the number of power units the carrier has reported on their recent MCS-150s multiplied by a utilization factor that is based on the number of miles per power unit. In the HOS Compliance, Controlled Substance and Alcohol, and Driver Fitness BASICs, the total is divided by the “time-weighted” driver inspections the carrier has undergone (inspections are time weighted the same as violations) in the previous two years. In the Vehicle Maintenance BASIC, the total is divided by the time-weighted vehicle inspections the carrier has undergone. In the HM BASIC, the severity and time weighted HM violations are divided by the time-weighted HM inspections.

Compliance Management

This “normalizing process” creates a “BASIC Measure” in each BASIC. This BASIC Measure is then compared to the BASIC Measures of other carriers in the carrier’s Safety Event Group. Carriers are assigned a Percentile Ranking within the Safety Event Group based on the carrier’s BASIC Measure. The carrier with the lowest (best) BASIC Measure is given a percentile rank (score) of 0, while the carrier with the highest (worst) BASIC Measure in the BASIC is given a percentile rank of 100. All other carriers in the Safety Event Group are assigned a percentile rank in between, based on their BASIC Measure. This percentile rank inside the Safety Event Group is the carrier’s BASIC Score.

To sum this process up, if a carrier has a BASIC Score of 70 this means that 69 percent of the carriers in the carrier’s Safety Event Group have a better BASIC Measure and only 29 percent of the carriers have a worse BASIC Measure.

The Safety Event Groups are based on the number of inspections with a violation in the BASIC, the number of driver inspections, the number of vehicle inspections, the number of HM inspections, or the number of crashes, depending on the BASIC. Here are the Safety Event Group Tables that the CSA SMS uses:

Safety Event Groups in the Unsafe Driving BASIC

Group	Number of inspections with Unsafe Driving violation: Combination Vehicle Fleet	Number of inspections with Unsafe Driving violation: Straight Vehicle Fleet
1	3-8	3-4
2	9-21	5-8
3	22-57	9-18
4	58-149	19-49
5	150 or more	50 or more

Safety Event Groups in the Driver Fitness, HOS Compliance, and Vehicle Maintenance BASICS

Group	Number of Relevant Inspections
1	3-10 (HOS); 5-10 (All others)
2	11-20
3	21-100
4	101-500
5	501+

A “relevant inspection” is a driver inspection in the driver-related BASICS and a vehicle inspection in the Vehicle Maintenance BASIC.

Safety Event Groups in the Controlled Substance and Alcohol BASIC

Group	Number of inspections with a Controlled Substance or Alcohol violation
1	1
2	2
3	3
4	4 or more

Notes

Vehicle Maintenance Pro

Notes

Safety Event Groups in the HM Compliance BASIC

Group	Number of Relevant Inspections
1	5-10
2	11-15
3	16-40
4	41-100
5	101+

A “relevant inspection” in the HM Compliance BASIC is an inspection where the vehicle required placarding at the time of the inspection.

Safety Event Groups in the Crash BASIC

Group	Number of crashes: Combination Vehicle Fleet	Number of crashes: Straight Vehicle Fleet
1	2-3	2
2	4-6	3-4
3	7-16	5-8
4	17-45	9-26
5	46 or more	27 or more

Driver scores are arrived at using a similar process, except that in the Unsafe Driving, Controlled Substances and Alcohol, and Crash BASICS the driver’s BASIC Measure is not a “normalized number.” The driver’s BASIC Measures in these BASICS are simply the total of all severity and time-weighted events.

Also, there are no driver Safety Event Groups in the Unsafe Driving, Controlled Substances and Alcohol, and Crash BASICS. Drivers’ BASIC Measures are directly compared to all other drivers’ BASIC Measures to determine the drivers’ percentile ranks, and therefore BASIC Scores.

In the other BASICS, the driver system mirrors the carrier system. To arrive at the BASIC Measures in the HOS Compliance and Driver Fitness BASICS, the total is divided by the time-weighted driver inspections the driver has undergone (inspections are time weighted the same as violations). In the Vehicle Maintenance BASIC, the total is divided by the time-weighted vehicle inspections the driver has undergone. In the HM BASIC, the severity and time-weighted HM violations are divided by the time-weighted HM inspections.

In these BASICS, the driver’s BASIC Measure is then compared to other drivers in their Safety Event Group. The driver’s percentile rank within the Safety Event Group is the driver’s BASIC Score. The Safety Event Groups are based on the number of inspections (see tables below).

Driver Safety Event Groups in the HOS Compliance, Driver Fitness, Vehicle Maintenance, and HM Compliance BASICS

Group	Number of Relevant Inspections
1	3
2	4-6
3	7+

Compliance Management

Once again, a “relevant inspection” is a driver inspection in the driver-related BASICs, a vehicle inspection in the Vehicle Maintenance BASIC, and a HM inspection in the HM Compliance BASIC.

Evaluation

Once the CSA Safety Measurement System has scored all carriers the next step is to evaluate the carriers to determine what carriers need an intervention. To evaluate carriers the FMCSA has been using a three-step approach.

The three-step approach uses carrier “type” (passenger, hazmat, and regular property are the only three types), carrier BASIC Scores, and predetermined thresholds. Carriers are subject to interventions if the carrier has a BASIC Score over the threshold in any BASIC, and the threshold is based on the carrier type.

Passenger Carriers: Passenger carriers have the lowest intervention thresholds. Passenger carriers for the purposes of the CSA program are carriers that have indicated they operate passenger-carrying vehicles on their MCS-150, and the passenger-carrying vehicles comprise more than 2 percent of the fleet vehicles. If a passenger carrier has a BASIC Score above these thresholds, the carrier is subjected to an intervention. Passenger carriers have an intervention threshold of:

- **50** in the Unsafe Driving, HOS Compliance, and Crash BASICs,
- **65** in the Controlled Substance and Alcohol, Driver Fitness, and Vehicle Maintenance BASICs, and
- **80** in the HM Compliance BASIC.

Hazmat Carriers: The thresholds for hazmat carriers are not as low as for the passenger carriers, but they are lower than the regular property carriers. A hazmat carrier for the purposes of the CSA program is a carrier that has had two roadside inspections during which the vehicle was required to be placarded in the last two years (with one having taken place in the last 12 months). Also the HM inspections must make up more than 5 percent of the carrier’s inspections. Carriers that have applied for and been issued the FMCSA’s hazardous materials safety permit are also evaluated as a hazmat carrier. The hazmat carrier thresholds are:

- **60** in the Unsafe Driving, HOS Compliance, and Crash BASICs,
- **75** in the Controlled Substance and Alcohol, Driver Fitness, and Vehicle Maintenance BASICs, and
- **80** in the HM Compliance BASIC.

Regular Property Carriers: Regular property carriers have the highest Intervention Threshold as their operations are viewed as the “lowest risk.” Here are the regular property carrier intervention thresholds:

- **65** in the Unsafe Driving, HOS Compliance, and Crash BASICs, and
- **80** in the Controlled Substance and Alcohol, Driver Fitness, Vehicles, and HM Compliance BASICs.

One warning about these intervention threshold numbers: The FMCSA has said that these numbers are one of the things that may change over

Notes

Vehicle Maintenance Pro

Notes

time (the other component that is likely to see more changes is the severity weighting table).

To be declared “Unfit” and ordered out of business, the carrier will need to be over a yet-to-be determined “Failing” threshold in one or more BASIC. However, no carrier (or driver) can be declared “Unfit” based on the BASIC Scores alone until the rule allowing such action is proposed, commented on, and made final. For the time being, carriers with high BASIC scores or multiple BASICs over the threshold are being subjected to the most severe intervention available to the FMCSA, a compliance review. If the carrier is rated as “Unsatisfactory” following the compliance review, the carrier can be subject to an out-of-service order. If the carrier fails to submit and follow a corrective action plan, the FMCSA can enforce the order effectively shutting the carrier down.

Two key points about driver evaluations and interventions: First, the driver BASIC Measures and Scores are confidential, and no one except officers, investigators, and auditors can see them (carriers can see the driver data, but not driver Measures and Scores by using the Driver Pre-employment Screening Program).

Second, there is no intervention threshold component to the Driver Safety Measurement System/Safety Evaluation (at this time). However, drivers are subject to interventions. The way the driver intervention system works for the moment (this is subject to change) is whenever a carrier undergoes an intervention, part of the intervention involves a check of all of the carrier’s drivers’ CSA BASIC Scores. Drivers with “high scores” (the FMCSA discussed using 90 at one time, but this has not been official adopted) have their violation records reviewed and may be intervened with directly at that point (given a formal warning letter called a Notice of Violation or a fine, called a Notice of Claim).

Interventions

Carriers that are below the threshold in all of the BASICs receive no intervention. They are allowed to continue to operate with no intervention. However, carriers could still receive a visit from an audit team if the carrier is involved in a serious crash, a series of crashes, or is the subject of a valid complaint.

Carriers that are above the threshold in any of the BASICs are considered in the “Alert” status, and may be subjected to an intervention. The exact intervention will depend on how high the BASIC score is, how many BASICs are over the threshold, and the carrier’s enforcement/intervention history with the FMCSA. The interventions include:

Warning letter: Warning letters inform the carrier that the FMCSA has seen a problem, and inform the carrier that they need to correct it, or further action will be forthcoming. There is no response required, only improvement.

Increased roadside enforcement: This intervention will result in the carrier being “flagged” as “optional” or “inspect” in the FMCSA data system that is visible to roadside officers (the ISS discussed earlier). This flagging will result in the carrier seeing an increased number of road inspections. To sum this intervention up, roadside inspectors will be “looking” for the carrier’s vehicles. Also, the officers on the road are able to see

Compliance Management

the BASIC or BASICs that have led to the ISS recommendation of “optional” or “inspect.”

Focused on and off site investigations: The “focused” interventions involve an auditor only checking the BASIC areas that the carrier is having trouble in. Example: the only BASIC a carrier is having trouble in is the HOS Compliance BASIC (too many drivers found not in compliance with the HOS regulations). The focused on or off site investigation will only involve compliance with the HOS regulations unless other problems are found or suspected.

Comprehensive (compliance) review: The Comprehensive Review is a full and complete review of the carrier’s safety program and all records related to it.

Cooperative Safety Plan: Cooperative safety plans can be used at any time, but can really be expected after another intervention did not go well. It involves submitting a plan to the FMCSA that explains how the carrier is going to address the problems that the intervention or SMS has pointed out.

Notice of Violation: A Notice of Violation is an official notice from the FMCSA that specific problems must be fixed, or else.

Notice of Claim/Settlement Agreement: This is the FMCSA’s method of fining a carrier.

Presently, the only interventions that are being used with drivers are Notice of Violation and Notice of Claim.

Scoring yourself in CSA

Of particular interest to the Maintenance Pro is the scoring in the Vehicle Maintenance BASIC. Here is a quick overview of the scoring in this BASIC:

Step 1

Locate all roadside inspections from the past two years that involved a vehicle inspection.

Step 2

Locate all roadside inspections that list a vehicle violation (the only exception is a vehicle violation listed on a driver-only inspection). Locate the severity weight in the table above for each vehicle violation on the inspection report.

Step 3

Add up the severity weights for all violations on each inspection. If the severity weights add up to more than 30, stop at 30. If the inspection had no violations, its severity weighting is 0.

Step 3

Time weight the severity weight total for each inspection. This is done by multiplying the severity weight by the appropriate time weight. The time weight is based on the date of inspection. The time weight for an inspection that took place in the last 6 months is 3, 6 to 12 months ago 2, and more than a year ago 1.

Notes

Vehicle Maintenance Pro

Notes

Step 4

Add the severity and time weighted total for all inspections together.

Step 5

The next step is to time weight all the vehicle inspections and driver inspections that listed a vehicle violation, good and bad. An inspection that occurred in the last 6 months is given a time weight of 3, 6 to 12 months ago 2, and more than a year ago 1.

Step 6

Divide the total of all time and severity weighted violations by the time weighted inspections total.

This number is the BASIC Measure for the Vehicle Maintenance BASIC. This is what will be used to determine the carrier's BASIC Score in the Vehicle Maintenance BASIC. It is also the key benchmark that a Maintenance Pro needs to watch. To improve the carrier's score, the Maintenance Pro will need to make this number go down. How do you do that? By eliminating on-the-road violations, especially the "high severity" violations.

Keeping your score low

To keep your score low you will need to track roadside inspection reports, maintenance repair (work) orders, on-the-road repairs, and make adjustments to the maintenance program. Changes could include shortening the maintenance interval or increasing the items checked during preventive maintenance.

The other component to lowering this score (or keeping it low) is working with drivers and making sure they are doing complete inspections, communicating defects to the company immediately, that they understand the company policy in respect to on-road-the road repairs, and that they do not operate vehicles that are in need of repair.

Checking your data

Maintenance managers and supervisors should either ask for, or get for themselves, a download of all roadside inspections the FMCSA has on file for the company. Of particular interests to you are vehicle roadside inspections and all roadside inspections that include a vehicle violation. This can be done for now by going to the Safety Measurement System website at: <http://ai.fmcsa.dot.gov/SMS>. At this point, enter the USDOT number and PIN number assigned to your company by the FMCSA in the section that says "Motor Carrier Login." If you do not know your PIN, check with the safety and operations departments to see if they have the PIN. If you cannot locate the PIN, the login system will instruct you on how to acquire it online or you may contact the FMCSA.

Once logged into the site, enter your USDOT number in the search box and click "search." After your overview page is displayed, click on the "Vehicle Maintenance" tab to display the Vehicle Maintenance BASIC page. As you scroll down the page, you will find a violation summary (this is useful for locating your high frequency and high severity violations,

Compliance Management

which are the ones you want to deal with quickly) followed by the inspection details section. You have two display options in this section, all relevant inspections or inspections with a vehicle violation. By clicking on the report number (the left most column) you can see the complete inspection report, including all violations written during the inspection, not just the summary of violations that is shown for each inspection.

You will want to compare this data to what you know through the violation reports that you have reviewed from the drivers. If an inspection appears in the FMCSA data that you were not aware of, check to see that an inspection from another carrier was not accidentally assigned to your fleet. Verify that the plate number and driver are yours. If the vehicle and driver are yours, find the driver involved and discuss the situation with him or her. If the inspection belongs to another carrier, file a challenge using the DataQs system.

Also, if you do not agree that a violation was actually a violation you can challenge the violation in DataQs. The key with this is going to be supporting your argument. You will need to provide proof that the violation did not exist at the time of the inspection or that the officer made a mistake.

DataQs can be accessed from any page in the CSA SMS. Simply click on the “How do I correct my data” link. DataQs will ask you to input the inspection date and number and to explain (and support) why the inspection or violation should not be in your data.

§396.11 Driver vehicle inspection report(s) (DVIRs), is the next requirement we’ll address — and this is a big one. This is the regulation most commonly cited following a compliance review or safety investigation (audit).

Your drivers, operations, and maintenance personnel must have a thorough understanding of the DVIR process. Make sure it is adequately covered during any training.

What exactly is this process? To ensure vehicle safety, each of your drivers should be required to perform a *post-trip* inspection at the end of each workday on all vehicles operated. The driver is *required* to complete a DVIR at the end of each workday.

Whatever DVIR form you use, remember, at a minimum, it must include provisions for three signatures:

- The signature of the driver who actually prepared the report;
- The signature of the mechanic who certified the reported defects or deficiencies were repaired or corrected — or that no corrections were needed; and
- The signature of the next driver who reviews the DVIR as part of his or her pretrip inspection acknowledging the corrective action taken (or agreeing that repairs were not necessary).

Under the intermodal roadability regulations, drivers must provide the intermodal provider with a written report reporting the condition of intermodal equipment when the equipment is returned, if there is a defect. Much like the DVIR, the intermodal provider must review these reports,

Notes

Vehicle Maintenance Pro

Notes

and a representative of the provider must sign that any reported defects were repaired, or that the defects listed did not require repair. This form is then kept by the provider for three months (unlike the carrier DVIR, the next driver does not have to sign that the repairs were completed or not necessary).

If you are operating intermodal chassis provided by an intermodal equipment provider, you and your driver are still subject to the regular carrier DVIR requirements (the chassis will show up on the driver's regular DVIR as a trailer). The additional reporting and retention requirement applies to the equipment provider, not the carrier. The only carrier requirement is the driver completing the intermodal equipment provider's inspection report and providing it to the equipment provider when returning the equipment, if there is a defect. These requirements are discussed in §396.11 and §396.12 (§396.12 only applies to intermodal equipment providers).

§396.13 Driver inspection, is the second *pretrip* inspection requirement found in the FMCSRs. Along with §392.7, it reinforces your drivers' responsibility to satisfy themselves that the CMV is in safe operating condition. This section also closes the loop on the DVIR process. It states your drivers must review the last DVIR and sign the report *only* if safety-related defects or deficiencies were noted and repairs were made.

As this failure of this process (pretrip/post trip/DVIR) is one of the most common reasons carriers are fined during compliance reviews, we will spend a little extra time on it.

This section (§396.13) mandates that the driver shall satisfy him or herself that basic parts and accessories are in *good working condition* before the vehicle is driven. There is no reporting requirement in the regulations for this inspection, which is referred to as a "pretrip inspection." Some carriers have created a "pretrip form" for use by the drivers, but this is not required by the regulations.

The pretrip requirement in Part 396 requires the driver to check the previous day's driver's DVIR (even if it is the same driver) as well as performing a pretrip inspection to assure that the vehicle is in safe working condition. The driver must then sign the previous day's DVIR below the "person performing repairs" signature if the previous DVIR noted any defects. This signature indicates that any necessary repairs were performed, or that the driver agrees that the repairs are not immediately necessary because the defect will not impact the safe operation of the vehicle.

Upon completion of the work day, the driver is to complete a DVIR reporting the condition of the vehicle to the carrier. Even if nothing is wrong with the vehicle, the driver must still complete the DVIR. As a convenience many carriers locate the DVIR on the back or lower half of the drivers' record of duty status (log). While this is convenient for the driver, it may create problems for the maintenance department as they may not normally receive the drivers' logs. If the drivers are marking defects on the DVIR form on the log, there needs to be a mechanism in place to get the DVIRs to the maintenance department, signed by the technicians

Compliance Management

performing the repairs, and signed by the next drivers to pretrip the vehicles.

Once the driver has completed the DVIR, it is the carrier's responsibility to act on the report. If the driver has noted any defects, the carrier must either repair them and sign the report, or mark that repairs are necessary, and then sign the report.

Drivers are allowed to sign as the person performing repairs for any repairs they perform. If a driver's post-trip inspection discovered a defective turn signal light, and the driver noted it on the DVIR, then repaired it, the driver would sign as the driver, the person completing the repair, and the next driver verifying the repair if he/she drove the vehicle the next day.

To sum it up, the driver inspection responsibility falls into two primary parts — the pretrip and post-trip inspections. After the post-trip, the driver is to complete a DVIR and submit it. If no defects are noted, no action is necessary (simply file the DVIR and retain it for three months). If the driver noted a defect, the carrier must act on the DVIR. The carrier must see to it the vehicle is repaired and then a representative of the carrier must sign the DVIR (or the driver or a mechanic from an outside shop if the vehicle is repaired on the road). The next driver must then sign that the repairs were completed (or that he/she agrees with the company representative that repairs were not necessary).

§396.17 and §396.19 Periodic inspection, are the regulations that require each of your CMVs to be inspected at least once every 12 months. This is the "annual" vehicle inspection regulation. These regulations also apply to intermodal equipment providers. They are required to see to it that the equipment they provide to motor carriers has been annually inspected.

The regulations require that all CMVs controlled by you and operated in interstate commerce pass an inspection at least annually. You are responsible to ensure all your vehicles are inspected (and that vehicles provided to you by others, such as intermodal equipment providers and leasing companies have been annually inspected).

If you do your own periodic inspections, they must be performed by a qualified inspector who meets the requirements found in §396.19.

If you are having an outside shop perform some or all of your periodic inspections, make sure that they are actually doing the inspections, and that the inspections are being done in accordance with the regulations. You, as a carrier, are still responsible for the inspection, even if it is done by another party.

There are cases (both criminal and civil) involving Maintenance Pros being held responsible for poor periodic inspections done by outside shops. The civil cases have involved Maintenance Pros not verifying that the outside shop was doing the periodic inspection correctly. The criminal cases involved Maintenance Pros knowing that the outside shops were not doing the inspections correctly. In one criminal case that led to jail time, the Maintenance Pro knew the shop was not even conducting the inspections, even though the carrier was receiving the required reports

Notes

Vehicle Maintenance Pro

Notes

and decals (the vehicles were never in the outside shop that issued the reports and decals).

§396.21 Periodic inspection recordkeeping requirements, provides the documentation rules for your periodic inspections.

The qualified inspector performing your annual inspections must prepare a report for each inspection which identifies:

- The name of the individual performing the inspection;
- The motor carrier operating the vehicle;
- The date of the inspection;
- The vehicle inspected; and
- The components inspected.

All periodic inspection reports must be retained where your vehicles are housed or maintained for 14 months. A copy of the inspection report, or a decal containing minimal information about the inspection, must be on your vehicles.

The annual inspection requirement can actually be met in a number of ways. The vehicle can:

- Pass a state or other jurisdiction roadside vehicle inspection, such as a Commercial Vehicle Safety Alliance Level I or Level 5 Inspection, and be issued a report and decal.
- Be inspected by a qualified inspector (according to the provisions of Section 396.19) on-site at the motor carrier's location and pass.
- Be inspected by your shop using a technician that you have qualified to perform periodic inspections.
- Be inspected by a commercial shop of some kind (shop, garage, or other third party acting as an agent for the motor carrier).
- Be inspected in one of the state-mandated programs which are equivalent to the federal requirements. States that have mandatory inspection programs that have been determined to be equivalent include:
 - Alabama (LPG Board)
 - California
 - Connecticut (bus inspection program)
 - Hawaii
 - Illinois
 - Louisiana
 - Maine
 - Maryland
 - Massachusetts
 - Michigan (bus inspection program)

Compliance Management

- Minnesota
- New Hampshire
- New Jersey
- New York
- Ohio (church bus inspection program)
- Pennsylvania
- Rhode Island
- Texas
- Utah
- Vermont
- Virginia
- Washington, D.C.
- West Virginia
- Wisconsin (bus inspection program)

What are the requirements? The specific items to be inspected are stated in Appendix G to Subchapter B — Minimum Periodic Inspection Standards, which is listed in the Regulation area of this manual. Also, at the end of this chapter is a sample Periodic Inspection Form.

One key point, you are allowed to certify technicians to perform periodic inspections. However, you must document that the individual knows the requirements of the regulations, and the procedures involved in performing the periodic inspections. The documentation must include proof that the individual *either* successfully completed a State- or Federal-sponsored training program, or has a combination of training and/or experience totaling at least 1 year. Such training and/or experience may consist of:

- Participation in a vehicle manufacturer-sponsored training program or similar commercial training program designed to train students in vehicle operation and maintenance.
- Experience as a mechanic or inspector in a motor carrier maintenance program.
- Experience as a mechanic or inspector at a commercial garage, fleet leasing company, or similar facility.
- Experience as a commercial vehicle inspector for a State, Provincial or Federal Government.

The documentation must be retained for the entire time the technician is employed, and for one year after the person leaves the company.

APPLY TO VEHICLE

237-FS-E3 (Rev. 7/97)

Notes

Likewise, §396.25 Qualifications of brake inspectors, provides qualification requirements for anyone you may have inspect, repair, service, or maintain the brakes of your CMVs.

Vehicle Maintenance Pro

Notes

A brake inspector is defined as a person who is an employee of a motor carrier responsible for ensuring that inspections, maintenance, repairs, or service to the brakes meet applicable safety standards.

To qualify as a brake inspector a technician must be knowledgeable of and have mastered the methods, procedures, tools and equipment used, and understands the brake service or inspection task to be accomplished. The technician must also be capable of performing the assigned brake service or inspection by reason of experience, training, or both as follows:

- Has successfully completed an apprenticeship program sponsored by a State, a Canadian Province, a Federal agency or a labor union.
- Has successfully completed a training program approved by a State, Provincial or Federal agency.
- Has a certificate from a State or Canadian Province which qualifies the person to perform the assigned brake service or inspection task.
- Has brake related-training or experience or a combination thereof totaling at least one year. Such training or experience may consist of participation in a training program sponsored by a brake or vehicle manufacturer or similar commercial training program, experience performing brake maintenance or inspection similar to the assigned brake service or inspection task in a motor carrier maintenance program, or experience performing brake maintenance or inspection similar to the assigned brake service or inspection task at a commercial garage, fleet leasing company, or similar facility.

| A driver without an *air brake restriction* on his or her CDL is qualified to inspect air brakes, but is *not* qualified to perform brake adjustments or other brake-related tasks unless the driver has the required training or experience to qualify as a brake inspector. A driver with an air-brake endorsement may only perform brake repairs (including adjustment) under the direct supervision of qualified brake inspector.

Finally, you are required to maintain evidence of brake inspector qualifications at your principal place of business or where the inspector is employed. The documentation must be retained for as long as the inspector is employed in that capacity and for one year thereafter for brake inspectors.

NAME OF BRAKE INSPECTOR (PRINT)

§396.25 Qualifications of brake inspectors.

(a) The motor carrier shall ensure that all inspections, maintenance, repairs or service to the brakes of its commercial motor vehicles, are performed in compliance with the requirements of this section.

(b) For purposes of this section, "brake inspector" means any employee of a motor carrier who is responsible for ensuring all brake inspections, maintenance, service, or repairs to any commercial motor vehicle, subject to the motor carrier's control, meet the applicable Federal standards.

(c) No motor carrier shall require or permit any employee who does not meet the minimum brake inspector qualifications of §396.25(d) to be responsible for the inspection, maintenance, service or repairs of any brakes on its commercial motor vehicles.

(d) The motor carrier shall ensure that each brake inspector is qualified.

I AM A QUALIFIED BRAKE INSPECTOR BASED ON THE FOLLOWING:

- (1) I understand the brake service or inspection task to be accomplished and can perform that task; and
- (2) I am knowledgeable of and have mastered the methods, procedures, tools, and equipment used when performing an assigned brake service or inspection task; and
- (3) I am capable of performing the assigned brake service or inspection by reason of experience, training or both as follows:

- (i) I have successfully completed an apprenticeship program sponsored by a State, a Canadian Province, a Federal agency or a labor union, or a training program approved by a State, Provincial or Federal agency, or have a certificate from a State or Canadian Province which qualifies me to perform the assigned brake service or inspection task (including passage of Commercial Driver's License air brake tests in the case of a brake inspection):

Name of Program/Certificate

OR

- (ii) I have brake-related training or experience or a combination thereof totaling at least **one year**. Such training or experience shall consist of:

- (A) Participation in a training program sponsored by a brake or vehicle manufacturer or a similar commercial training program designed to train students in brake maintenance or inspection similar to the assigned brake service or inspection tasks:

Name of Program/Certificate _____ How Long? _____ Months

Years
(Circle One)

or

- (B) Experience performing brake maintenance or inspection similar to the assigned brake service or inspection task in a motor carrier maintenance program:

Name of Employer _____ How Long? _____ Months

Years
(Circle One)

Name of Employer _____ How Long? _____ Months

Years

Appendix G and the CVSA North American Standard Out-of-Service Criteria

Appendix G. Appendix G to the FMCSA regulations establishes the conditions a vehicle must meet to pass a FMCSA periodic (sometimes referred to as an "annual") inspection. If the vehicle does not meet the conditions established in Appendix G, the inspector (usually not a law enforcement officer in this case, simply the title given to the person conducting the inspection) cannot pass the vehicle. The requirements for the periodic inspection are also referenced in other locations in the regulations. If a driver reports a defect, the carrier cannot put a vehicle back on the road until it meets the requirements of Appendix G (see the interpretation to §396.11, specifically Question 6 and the associated guidance).

Appendix G breaks the inspection down into 13 inspection areas, again broken down by vehicle component. They include standards covering:

- **Brake system**, including service brakes, parking brakes, brake drum or rotors, and brake hoses and tubing. For air brake vehicles the appendix includes standards on low pressure warning devices, tractor protection valves, and air compressors. The appendix also includes standards for electric brakes, hydraulic brakes, and vacuum systems that support brakes.
- **Coupling devices**, including fifth wheels (upper and lower), pintle hooks, drawbars and tow eyes, drawbar and towbar tongues, safety devise (chains or cables), and saddle mounts.
- **Exhaust systems**, including leaks, location of the discharge point of the exhaust, and damage to other parts from contact with the exhaust system.
- **Fuel systems**, including leaks, caps, and securement of the tank(s).
- **Lighting devices**. Appendix G simply states that the lights and reflectors on the vehicle must meet all light and reflector requirements of Part 393.
- **Safe loading**, including securement devices for cargo and other equipment (spare tires, dunnage, etc.).

Compliance Management

- **Steering mechanism**, including steering wheel free play, steering column, front axle beam, steering gear box, pitman arm, power steering mechanism and hoses, ball and socket joints, tie rods and drag links, nuts, and the steering system overall.
- **Suspension**, including U-bolt(s), spring hanger(s), axle positioning part(s), spring assembly, and torque, radius, or tracking components.
- **Frame**, including frame members (rails, crossmembers, and fasteners), tire and wheel clearances, and sliding component subframes.
- **Tires**, including tread depth, condition, inflation, load rating, and position and type matching.
- **Wheels and rims**, including rims, wheels, fasteners, and welds.
- **Windshield**, including discoloration and/or anything (cracks, stickers, etc.) that is restricting the vision of the driver.
- **Windshield wipers**. These standards require that all wipers be fully functional.

North American Out-of-Service Criteria. The 13 areas listed in Appendix G are also the basis for the out-of-service criteria, with a few differences. Generally, if the vehicle has a defect that would cause it to not pass a periodic inspection, it may be placed out of service during a roadside inspection conducted under §396.9.

Any vehicle placed out of service must be repaired before it can resume operating on the roadway. This will require having the vehicle repaired at the location of the inspection, or having the vehicle towed to a repair facility. Documentation of the repairs (and towing if the vehicle was towed) will need to be handled and filed correctly to verify that the terms of the out-of-service order were complied with.

The actual out-of-service criteria is published by the Commercial Vehicle Safety Alliance (CVSA). Complete copies of the CVSA inspection procedures and criteria are available through the CVSA website at <http://www.cvsa.org/>.

As a general rule, the CVSA Out-of-Service Criteria follows Appendix G. The difference between the CVSA Out-of-Service Criteria and Appendix G is explained at the end of Appendix G. When there are differences, the out-of-service criteria is not as strict as Appendix G.

An example would be brakes. One defective brake (bad shoe, drum, or brake out-of-adjustment) would lead to a vehicle not passing a periodic inspection because of the Appendix G requirements. In the out-of-service criteria, the vehicle may be allowed to continue if only one brake has a defect. The vehicle is still in violation and the vehicle would not pass a periodic inspection, but the inspector may allow it to continue its trip and be repaired before its next dispatch, rather than placing it out of service.

Here is a list of the differences:

- **Brakes.** Appendix G criteria will not allow a vehicle to pass inspection if it has any brake defects (defective brakes, brakes out-of-adjustment, any air leaks, etc). The out-of-service criteria allows up to 20 percent of the brakes on non-steering axles to be defective

Notes

Vehicle Maintenance Pro

Notes

before the vehicle is to be placed out-of-service. The out-of-service criteria also allows the roadside inspector a certain latitude before placing a vehicle out-of-service for air leaks.

- **Coupling devices.** Vehicles with any fifth wheel fastener missing or ineffective will not pass a periodic inspection under the requirements of Appendix G. The out-of-service criteria allows up to 20 percent missing or ineffective fasteners on frame mountings and pivot bracket mountings. On sliding fifth wheels up to 25 percent of the slider-latching fasteners are allowed to be ineffective. The out-of-service criteria also allows the inspector some latitude on cracked welds.
- **Exhaust.** The out-of-service criteria allows vehicles to exhaust forward of the locations specified in §393.83 as long as the exhaust does not leak or exhaust under the chassis. Otherwise, Appendix G follows §393.83 verbatim.
- **Lights.** Appendix G requires all lighting devices required by Part 393 to be operative. The out-of-service criteria allows a vehicle to stay in service if it has one stop light and turn signal functioning on the rear of the vehicle. In addition, during the hours of darkness, a vehicle can stay in service if it has one operative head lamp and tail lamp.
- **Suspension.** Appendix G does not allow any broken leaves in a leaf spring assembly. The out-of-service criteria allows up to 25% broken or missing leaves before requiring the vehicle be placed out of service.
- **Frame.** The out of service criteria allows a certain latitude in frame cracks before placing a vehicle out-of-service. Appendix G does not allow any frame cracks.
- **Tires.** Appendix G requires a tire tread depth of $\frac{4}{32}$ inch on steering axles and $\frac{2}{32}$ inch on all other axles. The out-of-service criteria only requires $\frac{2}{32}$ inch tire tread depth on steering axles and $\frac{1}{32}$ inch on all other axles.
- **Wheels and rims.** The out-of-service criteria allows a certain amount of latitude for wheel and rim cracks, and missing or defective fasteners. Appendix G does not allow any defects in the wheels and rims, or fasteners.
- **Windshield.** The out-of-service criteria places in a “restricted” service condition any vehicle that has a crack or discoloration in the windshield within the sweep of the wiper on the driver’s side. The out-of-service criteria does not address the remaining area of the windshield. Appendix G addresses the condition of the entire windshield.
- **Windshield wipers.** Appendix G requires all windshield wipers to be operative. The out-of-service criteria only requires that the windshield wiper on the driver’s side be operative during inclement weather.

The out-of-service criteria also includes several items not addressed in Appendix G. Examples include defects involving the vehicle’s driveshaft

Compliance Management

and electrical cables (high wattage wiring that is not overload protected) on buses.

How Part 393, Appendix G, and the CVSA Out-of-Service Criteria fit together. It is important to understand the relationship between the regulations, Appendix G, and the Commercial Vehicle Safety Alliance (CVSA) Out-of-Service Criteria.

Any defect that is a violation of the regulations in Part 393 can be noted as a violation on a roadside inspection. Also, the carrier and/or driver can be warned or cited for any violation of Part 393.

If the inspector finds a defect that is a violation of Part 393 his/her next decision is “Does the defect warrant an out-of-service order?” To determine if the defect warrants an out-of-service order the inspector will compare the defect to Appendix G and the CVSA Out-of-Service Criteria.

If the defect is specifically mentioned in Appendix G or the out-of-service criteria, the vehicle may be placed out of service.

The legal actions taken as a result of a violation (the warning or citation) and the decision to place the vehicle out of service are not necessarily related. A vehicle found to have defective headlights during daylight hours can be warned or cited for having defective required lights, which is a violation of the regulations, but may not be placed out of service.

To sum it up, the out-of-service criteria is strictly intended to get vehicles that are in an unsafe condition repaired before allowing them to continue.

Part 391— Qualification of drivers

Many operations are unaware that their mechanics are actually *drivers* for DOT purposes, if they operate commercial vehicles on the roadways. This means that all the necessary paperwork that would be kept for actual drivers must be kept for mechanics. To determine if your mechanics fall under Parts 390 through 396, you need to consider the following factors:

- Do your mechanics test-run vehicles defined as commercial motor vehicles (CMV) as found in §390.5? According to §390.5 a “commercial motor vehicle” is any vehicle with a gross weight rating, a gross combination weight rating, or an actual weight of over 10,001 or more pounds, and is used for interstate commerce.
- Are these vehicles taken onto a public highway as defined in §390.5? This can include a private driveway or lot which allows vehicles, vendors, and visitors unrestricted access. Even backing a CMV in or out of a stall into a parking spot could qualify your drivers by these definitions.
- Are you involved in interstate commerce as defined in §390.5? If not, you would need to contact your individual state agency to see which of the federal regulations have been adopted for intrastate commerce, and if any exceptions exist or definitions differ.

If you meet the criteria, your mechanics fall under the following areas: driver qualification, hours of service, vehicle inspections, and possibly drug and alcohol testing.

Notes

Vehicle Maintenance Pro

Notes

If your technicians qualify as drivers under the applicable definitions in §390.5, then you and your mechanics are subject to Part 391 — Driver Qualifications, including maintaining a Driver Qualification File.

§391.11 Driver Qualifications. The first question in qualifying a technician as a driver is: Is the technician qualified? According to §391.11(b), an individual is qualified to drive a commercial motor vehicle if the individual:

- Is at least 21 years old;
- Can read and speak the English language sufficiently to converse with the general public, to understand highway traffic signs and signals in the English language, to respond to official inquiries, and to make entries on reports and records (§391.11(b)(2) is “the must be able to read and write English” requirement);
- Can, by reason of experience, training, or both, safely operate the type of CMV you intend to have the driver drive;
- Is physically qualified to drive a commercial motor vehicle (has passed a FMCSA physical and the company has a valid medical certificate or a copy of a MVR showing the technician as medically qualified on file);
- Has one valid commercial motor vehicle operator’s license;
- Has prepared and furnished you with a list of violations (other than parking tickets) covering the last 12 months;
- Is not disqualified to drive a CMV (see §391.15 below); and
- Has successfully completed a road test and has been issued a certificate of driver’s road test, or has presented you with an acceptable equivalent (an operator’s license that required a road test to get or a certificate of road test from a previous employer).

§391.15 Disqualification of drivers, prohibits you from using a *disqualified* driver to operate any of your CMVs. Keep in mind that the disqualification rules found in §391.15 apply to technicians also.

One of the most important things to understand about §391.15 is how it relates to §383.51, disqualification of CDL licensed drivers. Section 383.51 applies to *interstate and intrastate* drivers required to have a CDL to operate the vehicle. Section 391.15 applies to *interstate* drivers of commercial vehicles over 10,000 pounds, transporting hazmat requiring a placard, or transporting more than 15 passengers (including the driver). If a driver is subject to both sections, the more stringent regulation will apply. In most cases that will be §383.51.

Under §391.15(b) Disqualification for loss of driving privileges, if a technician loses his or her CMV operator’s license (either temporarily or permanently) by reason of revocation, suspension, withdrawal, or denial, that driver becomes *disqualified*.

Compliance Management

How do you discover any of the above conditions? Your technician is required to tell you.

§391.15(c) provides further disqualification information including:

- Disqualification for certain criminal offenses;
- Disqualifying offenses; and
- Duration of disqualification.

§391.15(d) Disqualification for violation of out-of-service orders, applies to anyone who drives a commercial vehicle for the company. Any driver or technician who is convicted of violating an out-of-service order is disqualified for the following period of time:

- First violation — A driver is disqualified for not less than 90 days nor more than one year if the driver is convicted of a first violation of an out-of-service order.
- Second violation — A driver is disqualified for not less than one year nor more than five years if, during any 10-year period, the driver is convicted of two violations of out-of-service orders in separate incidents.
- Third or subsequent violation — A driver is disqualified for not less than three years nor more than five years if, during any 10-year period, the driver is convicted of three or more violations of out-of-service orders in separate incidents.

One key point to remember — DO NOT SEND A TECHNICIAN WHO IS QUALIFIED AS A DRIVER TO DRIVE AN OUT-OF-SERVICE VEHICLE TO THE TERMINAL FOR A DRIVER. If your technician is caught operating an out-of-service vehicle, the technician will suffer the same fate as the driver would have. If it is necessary to send a technician out, have him/her repair the vehicle before operating it!

§391.21 provides the requirements (actual content) your driver applications must contain. If your technicians need to be qualified as drivers, they will need to complete a driver application.

§391.23 Investigation and inquiries, can be a very frustrating section for many motor carrier professionals, but it remains a critically important. Keeping things simple, §391.23 requires two basic investigations:

- An inquiry into the technician's driving record for the past three years — a motor vehicle record (MVR) check; and
- An investigation of the technician's safety performance history with Department of Transportation regulated employers during the past three years.

The rules require the following information from a driver applicant's previous DOT-regulated employers:

- General driver identification and employment verification information;
- Information about accidents the applicant may have been involved in;

Notes

Vehicle Maintenance Pro

Notes

- Whether the applicant violated any of the DOT alcohol and drug regulations; and
- Whether the applicant completed a substance abuse rehabilitation program, if required.

Three key points to understand — First, this must be done no matter what the driver applicant's job title was at a previous employer, if the employer was regulated by the DOT. Second, if the applicant has no previous employers who were DOT-regulated, you must document that the applicant did not have any previous employers who were DOT-regulated. Finally, if you are qualifying a technician who previously had not been qualified to drive vehicles on the roadway, you will need to follow the same procedures (driver application and background checks).

§391.25 Annual inquiry and review of driving record, and §391.27 Record of violations, are collectively known as the “annual review process.” Although these regulations may appear very involved and complicated, in reality the annual review process is a fairly straightforward 3-step process. At least once every 12 months, and for each driver you employ (including technicians that are qualified as drivers), you are required to:

- Make an inquiry into the driver's driving record (run an annual MVR — §391.25(a));
- Review the annual MVR, and create a note that includes the name of the person who performed the review, and the date of the review (§391.25(c)(2)); and
- Have each driver prepare a list of all violations he or she has been convicted of in the last 12 months (also known as the driver's annual certification of violations — §391.27(a)).

§391.41 .43 and .45. These regulations require that all drivers operating any commercial vehicle on the road undergo a physical examination at least once every two years (more often if the individual has a medical condition that requires additional monitoring). Upon completion of the physical, the driver is provided with a medical certificate (sometimes referred to as a “medical card” or “fed med card”). Drivers must have a copy of a valid medical card on them whenever driving a commercial vehicle. The driver's employing carrier must have a copy of medical certificate on file.

If the technician has a CDL, the driver must also report to the state licensing authority and “self-certify” that he/she is a non-exempt interstate driver and provide the state driver licensing authority a copy of the medical card whenever the technician passes a physical (the technician was to have done this initially by January 30, 2014). Some states allow this process to be done online, unless the driver is involved in an initial license issue or a CDL renewal. In those cases, the driver will normally have to appear live at the driver licensing authority.

After January 30, 2015, the employing carrier will have to have a motor vehicle report (an MVR, also known as a driving record) on file showing the driver's medical status, rather than have a copy of the medical card,

Compliance Management

for all CDL licensed drivers (including technicians that operate vehicles on the road).

There is no exception to these rules for technicians who only occasionally drive a commercial vehicle on the road.

§391.51 Driver Qualifications file. Proof of the technician's qualification to drive a commercial vehicle must be kept in a "driver qualifications file," also known as a DQ file. A DQ file must contain:

- The application for employment completed in accordance with §391.21 (permanent document);
- A copy of the response by each state agency, pursuant to §391.23 (permanent document);
- The certificate of driver's road test issued to the driver pursuant to §391.31(e), or a copy of the license or certificate which the motor carrier accepted as equivalent to the driver's road test pursuant to §391.33 (permanent document);
- The response of each State agency to the annual driver record inquiry required by §391.25(a) (updated document, retained for 3 years);
- A note relating to the annual review of the driver's driving record as required by §391.25(c)(2) (updated document, retained for 3 years);
- A list or certificate relating to violations of motor vehicle laws and ordinances required by §391.27 (updated document, retained for 3 years);
- A copy of the medical examiner's certificate as required by §391.43(f) or a copy of a MVR showing the driver as medically qualified if the driver (technician) has a CDL. If the most-recent MVR does not have the CDL driver's medical information on it, then a copy of the medical card must be on file (updated document, retained for 3 years);
- Proof that the examiner conducting the medical exam was listed on the National Registry of Certified Medical Examiners (NRCME) at the time of the exam, if the exam took place after May 21, 2014; and
- A letter from the Field Administrator, Division Administrator, or State Director granting a waiver of a physical disqualification, if a waiver was issued under §391.49 (if applicable, retained for 3 years).

Note: As of January 30, 2015, the only acceptable proof of medical qualification for a CDL driver (including technicians who do road tests) in the DQ file will be an MVR with the driver's medical certification information on it. Having a copy of the medical certificate in the DQ file will no longer be considered proof that the driver is medically qualified. The only exception is for the first 15 days after the driver passes a physical. During these 15 days, you can have a copy of the new medical card in the file as proof of medical qualification. During these 15 days the driver is to submit a copy of the card to his/her license state, the state is to enter the information onto the driver's MVR, and the company is to secure a new MVR showing the new medical qualification information and place it into the DQ file.

Notes

Vehicle Maintenance Pro

Notes

Part 395 — Hours of Service

Part 395 is the part of the regulations that contains the hours-of-service regulations. This is a very complicated part, and one that many carriers are fined because of, so we will spend a fair amount of time summarizing it.

Carrier officials view hours-of-service compliance as strictly a safety department issue. The FMCSA views hours-of-service compliance as an operational issue. A carrier's operation is expected to comply with these regulations. Throughout this entire part the terminology used is "No motor carrier shall permit or require a driver to...nor shall a driver..." To sum it up, the carrier is responsible for the actions of their drivers, and controlling their drivers, in this area. This includes technicians who occasionally drive.

Part 395 contains the following active sections that should concern a Maintenance Pro:

- §395.1 Scope of rules in this part;
- §395.2 Definitions;
- §395.3 Maximum driving time for property-carrying vehicles;
- §395.5 Maximum driving time for passenger-carrying vehicles;
- §395.8 Driver's record of duty status;
- §395.13 Drivers declared out of service; and
- §395.15 Automatic on-board recording devices.

§395.1 Scope of rules in this part, contains the *general* applicability and *exceptions* to the HOS regulations.

Basically, the HOS rules apply to *all* interstate motor carriers and their drivers (including technicians operating on the roadway). In addition, most states have adopted either all or most of Part 395.

§395.1 also provides certain exemptions from the regulations. The exemptions that may involve technicians are:

- §395.1(e)(1) CDL vehicle drivers that stay within 100 air-miles of their work reporting location, start and end their day at the same work location, and do not work more than 12 hours (cannot drive more the 11 out of the 12), do not have to fill out a log (see §395.8 for an explanation of the driver's log). The carrier must keep time records that show the starting and ending time, and total hours worked for each workday in place of the log. Finally, the driver may not drive after having reached 60 hours in the last seven days, or 70 hours in the last eight days (depending on the carrier's operations).
- §395.1(e)(2) Non-CDL vehicle drivers that stay within 150 miles of their work reporting location, start and end their day at the same work location, and do not work more than 14 or 16 hours (cannot drive more the 11 out of the 14 or 16), do not have to fill out a log. The carrier must keep time records that show the starting and ending time, and total hours worked for each workday in place of the log. Finally, the driver may not drive after having reached 60 hours in

Compliance Management

the last seven days, or 70 hours in the last eight days (depending on the carrier's operations).

Drivers that qualify for the short-haul exceptions in §395.1 also do not have to take the required 30-minute break that is discussed in §395.3 (the "limits" portion of the hours-of-service regulations discussed next).

Although you should become familiar with all the terms found under §395.2 Definitions, we will examine a few particularly important ones:

- Driving time means all time spent at the driving controls of a commercial motor vehicle in operation.
- On-duty time means all time from the time a driver begins work or is required to be in readiness to work until the time the driver is relieved from work and all responsibility for performing work.

§395.3 Maximum driving time for property-carrying vehicles — Uses straight forward wording to get the point across. No motor carrier shall permit or require any driver to **drive** a property-carrying commercial motor vehicle, nor shall any such driver **drive** a property-carrying commercial motor vehicle:

- If it has been 8 hours (or more) since the driver's last break of 30 minutes or more (this rule does not apply to drivers operating under one of the "short-haul" exceptions found in §395.1(e));
- More than 11 **cumulative** hours following 10 consecutive hours off duty; or
- For any period after the end of the 14th hour after coming on duty following 10 consecutive hours off duty (the exception is drivers operating under one of the short-haul exceptions that allow the driver to drive up to the 16th hour, such as drivers operating under the exception at §395.1(e)(2) discussed earlier).

By the way, if the driver (technician) did not get 10 hours off (only got 8 hours off), the clock is still ticking. The driver must have a full 10 hours off to start the next 11- and 14-hour work cycle.

The next set of rules are in place to combat the effects of cumulative fatigue. No motor carrier shall permit or require a driver of a property-carrying commercial motor vehicle to drive, nor shall any driver **drive** a property-carrying commercial motor vehicle, regardless of the number of motor carriers using the driver's services, for any period after:

- Having been on duty 60 hours in any 7 consecutive days if the employing motor carrier does not operate commercial motor vehicles every day of the week; or
- Having been on duty 70 hours in any period of 8 consecutive days if the employing motor carrier operates commercial motor vehicles every day of the week.

In addition to the above, the regulations contain a *restart* provision, that states that any period of 7 or 8 consecutive days may end with the beginning of any off-duty period of **34** or more consecutive hours. The 34-hour break must meet certain requirements, including:

Notes

Vehicle Maintenance Pro

Notes

- Not starting the restart until 168 hours have passed since the start of the last restart.
- The 34-hour period including two 1 a.m. to 5 a.m. periods.

If the driver cannot meet the requirements — the break is too soon after the driver's last restart, the break is not at least 34 hours long, or the break does not include two 1 a.m. to 5 a.m. periods — the driver cannot count time off as a restart, and must continue calculating his/her hours using the working hours from all of the last 7 or 8 days.

§395.5 Maximum driving time for passenger-carrying vehicles — No motor carrier shall permit or require any driver used by it to drive a passenger-carrying commercial motor vehicle, nor shall any such driver drive a passenger-carrying commercial motor vehicle more than 10 hours following 8 consecutive hours off duty, or for any period after having accumulated 15 hours on duty following 8 consecutive hours off duty.

In addition to the 10- and 15-hour rules, passenger-carrying drivers are also subject to the same 60 hour/7-day or 70 hour/8-day rule.

§395.8 Driver's record of duty status. These regulations provide the form the log is to take and the manner in which it is to be completed and submitted. Violations discovered on the actual record of duty status (log) are commonly referred to as *form-and-manner* violations.

Your drivers are required to record their duty status for each 24-hour period (in duplicate) on a graph/grid. However, if your organization has such technology, your drivers may use an automatic on-board recording device (electronic log) as long as it meets the requirements. Also, if your technicians qualify for one of the exemptions discussed earlier, they do not have to complete a log.

Under §395.8 you are required to systematically retain records of duty status and all supporting documents for each driver you employ for a period of six months from the date of receipt. If you are using time cards to comply (driver is operating under one of the exemptions), they need to be retained for six months.

§395.15 allows carriers to use Automatic On-Board Recording Devices (AOBRD) rather than having their driver complete logs. These regulations provide the technical and operational requirements for AOBRDs. As a Maintenance Pro you may need to become familiar with these devices if your company uses them. The maintenance requirements are generally fairly simple (the unit must be synchronized with the vehicle and record time, speed, and driver input) meaning that the unit will be connected into the J1939 bus and draw power from somewhere on the vehicle. The manufacturers' specifications (vehicle and AOBRD) will assist in deciding where to connect into the vehicle.

Compliance Management

Additional rules that apply to technicians who operate CDL vehicles on the roadway

These final two summaries cover regulations that apply only to drivers of vehicles which require the driver have a CDL to operate. A CDL is required if the vehicle meets the following definition: Commercial motor vehicle means a vehicle used in commerce that:

- Has a GCWR of 26,001 or more pounds with a towed unit of more than 10,000 pounds GVWR (note that a tractor weighing 25,000 pounds towing a 9,500-pound trailer, for example, would be exempt — the trailer must weigh more than 10,000 pounds);
- Has a GVWR of 26,001 or more pounds;
- Is designed to carry 16 or more passengers, including the driver; or
- Is any size and is placarded for hazardous materials.

Part 382 and Part 40, the two parts covering drug and alcohol testing have “liability” written all over them. If your drivers are using drugs or abusing alcohol, they are a walking, talking risk for your company. This applies to all drivers, from the full-timer to the technician that drives once a month. A plaintiff’s attorney would like nothing better than to be able to show in court how your company allowed a substance abuser to drive an 80,000-pound rig into their client’s car.

Part 382 - Controlled substances and alcohol use and testing, contains six Subparts:

- **Subpart A** — General
- **Subpart B** — Prohibitions
- **Subpart C** — Tests Required
- **Subpart D** — Handling of Test Results, Record Retention, and Confidentiality
- **Subpart E** — Consequences for Drivers Engaging in Substance Use-Related Conduct
- **Subpart F** — Alcohol Misuse and Controlled Substances Use Information, Training, and Referral

Together with Part 40, the drug and alcohol testing regulations are chocked full of complex testing, training, and recordkeeping requirements, enough to fill a complete book. Chances are, you’ll be leaving some of the administration of these regulations up to others, so let’s concentrate on those sections that you *need* to understand.

Subpart A — General

§382.111 Other requirements imposed by employers needs to be thoroughly reviewed and seriously considered.

This section reiterates the fact that the federal regulations are the *minimum* requirements. This regulation allows you, in general, to impose additional, or more stringent, requirements.

Notes

Vehicle Maintenance Pro

Reserved

Compliance Management

However, keep in mind that these regulations are quite strict when it comes to the separation of the DOT drug and alcohol testing program from any company-specific requirements. You must be certain that you are in full compliance with DOT requirements before you start imposing additional restrictions, tests, and/or penalties on your drivers.

Under **§382.113 Requirement for notice**, before you send an employee for a DOT-required drug or alcohol test, you must notify them (verbally or in writing) that the test(s) are required by the DOT under Part 382. If it's a company test (not a DOT test), you must *not* tell them that it's a DOT-required test.

The simplest method to accomplish this may be to hand your drivers a copy of a notification form when you instruct them to report for a test.

§382.121 Employee admission of alcohol and controlled substances use, allows you to set up a "voluntary admission" program that will allow your drivers to admit to a drug or alcohol problem without becoming subject to the DOT's rehabilitation requirements. After undergoing treatment, the employee will return to work for you.

If you want a self-admission program at your company, you'll need a written, voluntary self-identification program or policy that meets the requirements of §382.121.

Employees admitting to a problem under this provision must do so *before* reporting for duty, and must not use this as an excuse to avoid a DOT-required drug or alcohol test.

Subpart B - Prohibitions

All drivers (including the technicians that only occasionally drive a commercial vehicle requiring a CDL to operate) are prohibited from:

- Reporting for duty with a blood-alcohol content (BAC) of 0.04 or greater;
- Using drugs, unless under a doctor's advice;
- Using alcohol while performing, or 4 hours before performing, safety-sensitive functions;
- Using alcohol within 8 hours following an accident or until tested (see discussion of post-accident testing below);
- Refusing to submit to a required alcohol or drug test; or
- Reporting for duty after testing positive for drugs, or after adulterating or substituting a test specimen.

Employer prohibitions — As an employer, you are prohibited from allowing a driver (here again, including the technicians that only occasionally drive a commercial vehicle requiring a CDL to operate) to perform safety-sensitive functions when you have "actual knowledge" that the driver:

- Has a BAC of 0.04 or more;
- Is using alcohol, or used alcohol within the previous four hours;

Notes

Vehicle Maintenance Pro

Notes

- Has used drugs;
- Has tested positive for drugs, or has adulterated or substituted a test specimen; or
- Has refused to undergo a DOT-required test.

What is *actual knowledge*? You only have actual knowledge of a violation if:

- You **directly observe** a driver using drugs or alcohol. If you only observe employee behavior or physical characteristics that *suggest* drug or alcohol use, you may want to conduct a reasonable suspicion test.
- You obtain information from the driver's previous employer(s).
- The driver receives a traffic citation for driving a CMV while under the influence of drugs or alcohol.
- The employee admits to the use of drugs or alcohol (unless the admission falls under the company's self-admission program).

Subpart C — Tests Required

This subpart describes the six types of drug/alcohol tests you may be required to perform:

- Pre-employment tests.
- Post-accident tests.
- Random tests.
- Reasonable-suspicion tests.
- Return-to-duty tests.
- Follow-up tests.

§382.301 Pre-employment testing requires you to have in your hand a *verified* negative drug test result before a new driver first performs a safety-sensitive function for your company. This applies even if the technician is a long-term employee of the company who is just beginning to act as a driver on occasion.

§382.303 Post-accident testing, requires you to test your drivers for drugs and alcohol after certain types of motor vehicle accidents. This requirement includes technicians if they are involved in one of these types of accidents while operating a vehicle on a public roadway that requires a CDL to operate. Here is a table that shows the specific requirements:

Type of accident	Was a citation issued to the CMV driver?	Does a test have to be performed?
Human fatality	YES or NO	YES
Bodily injury with treatment away from the scene	YES	YES
	NO	NO

Compliance Management

Disabling damage requiring tow	YES	YES
	NO	NO

Notes

The alcohol test is to be completed within two hours of the accident. If this is not possible, the driver and carrier need to document why it could not be completed. In such cases the carrier and driver then have an additional six hours to complete the alcohol test, or a total of eight hours from the time of the accident.

The drug test must be completed within 32 hours of the accident. *The FMCSA will not accept any excuses if the tests are not performed.* Once the tests are complete the driver can return to duty.

If you chose to implement a post-accident/injury drug and alcohol testing program to test after all accidents and injuries, you will need to do that under general employment. You cannot test a driver following an accident under these regulations unless the accident meets the requirements shown above.

§382.305 Random testing, is another complex, often-violated regulation. It says you must be randomly testing all of your CDL drivers (including the technicians that only occasionally drive a commercial vehicle requiring a CDL to operate) for drugs and alcohol at the rates required in the regulations.

Presently, you must test at least 50 percent of your drivers for drugs, and 10 percent of your drivers for alcohol, over the calendar year. The test should be performed when the driver is reporting for duty or performing a safety-sensitive function. The driver cannot receive any advanced warning about the test.

Selected drivers must report for testing immediately after being notified. Alcohol tests must take place while the driver is performing safety-sensitive functions, or immediately before or immediately after performing safety-sensitive functions.

Your random program must test *randomly*. This is where many companies get into trouble. Drawing names or ID numbers out of a hat is *not* random selection.

Even if you have only two drivers, you must select them for random testing using a *scientifically valid method*.

Each person at the company that operates commercial vehicles requiring a CDL to operate must be in the selection pool, including the technicians that only occasionally drive, and they all must have an equal chance of being selected each time a selection is made. This means that a driver may be tested more than once each year.

The drivers must be tested during the selection period in which they are chosen. For example, if you have quarterly selection periods and you select a driver in January, he or she must be tested by the end of March.

As with the post-accident testing, once the test is complete the driver can return to duty.

Vehicle Maintenance Pro

Notes

§382.307 Reasonable suspicion testing, states that you *shall* require a driver (including a technician that only occasionally drives a commercial vehicle requiring a CDL to operate) to submit to a drug or alcohol test when you have reasonable suspicion to believe that the driver has violated the DOT's prohibitions on drug and alcohol use.

Several conditions must be met before you can send a driver for a reasonable-suspicion test:

- A trained supervisor must make the observation, but he/she may not administer the test. The supervisor must have received the required two hours of reasonable-suspicion training (see the regulation at §382.603).
- The supervisor must base his/her decision on “specific, contemporaneous, articulable observations concerning the appearance, behavior, speech, or body odors of the driver.” In other words, the supervisor must directly observe the driver exhibiting signs that he/she is under the influence of drugs or alcohol, and the supervisor must be able to document those observations in writing. Observation of the chronic and withdrawal effects of drug use may be used as the basis for a drug test.
- For an alcohol test, the observations must be made while, just before, or just after the driver performs safety-sensitive functions. If the alcohol test does not take place within **two hours** after it is determined that a test is necessary, you must document why the test was not done promptly. If the test is not done within **eight hours**, it must not take place at all, and you must document why it was not done.

In the case of a reasonable-suspicion test, you should not return the driver to duty until you have *verified* negative results in hand.

One of the keys to a *successful* reasonable-suspicion test is good documentation. A detailed written record of your observations is not only required, but also will help protect you in the event you have to take disciplinary action against the employee.

Subpart D — Handling of Test Results, Record Retention, and Confidentiality

The recordkeeping requirements found within Subpart D describe what records to keep, when you can toss them, and to whom you can release them.

Generally, this section requires you to keep these records under lock and key, such as in a locked filing cabinet. The records may be combined with driver qualification files or personnel records, but then those records as well must be secured. The records should only be released to anyone other than program administrators if a release signed by the driver is presented.

Compliance Management

The record retention requirements vary depending on the type of record and the results of the drug/alcohol test(s). Generally, all records pertaining to a positive test (or refusal) must be kept for five years, and all records pertaining to a negative test must be kept for one year.

Subpart E - Consequences for Drivers Engaging in Substance Use-Related Conduct

§382.501 Removal from safety-sensitive function. If one of your drivers (including one of the technicians that only occasionally drive a commercial vehicle requiring a CDL to operate) is found to have violated any of the prohibitions described in Subpart B (described above, including failing or refusing any DOT drug or alcohol test), you must immediately remove that driver from performing any safety-sensitive functions. Remember that positive test results must be verified before you can take action against the driver.

It might be obvious, but “immediately” means *immediately*. Do whatever it takes to get that driver out of the cab before disaster strikes.

Once removed from safety-sensitive functions, the driver cannot return to duty until completing an evaluation by a Substance Abuse Professional (SAP) and passing a return-to-duty test. The employee must also undergo a prescribed regiment of follow-up tests to verify compliance after being returned to duty.

Note: The return-to-duty and follow-up testing requirements apply to you only if you wish to continue the driver’s employment and return him/her to duty as a driver. If you chose to terminate the driver, all you must do is provide the driver with SAP contact information. The driver will need to make arrangements for the SAP evaluation, and for the return-to-duty and follow-up tests, on their own or with their next employer.

§382.505 Other alcohol-related conduct. If a driver’s DOT alcohol test result is between 0.02 and 0.04 BAC, the driver must be removed from duty for at least 24 hours. The driver should not return to work until his or her next regularly scheduled duty period.

Subpart F - Alcohol Misuse and Controlled Substances Use Information, Training, and Referral

§382.601 Employer obligation to promulgate a policy on the misuse of alcohol and use of controlled substances states you must provide your all drivers (including the technicians that only occasionally drive a commercial vehicle requiring a CDL to operate) with a copy of your written policies and other materials concerning alcohol abuse and drug use, and you must obtain a signed receipt from them certifying that the drivers have received these materials.

382.603 Training for supervisors requires that supervisors receive at least two hours of training to help them determine when “reasonable suspicion” exists to require drivers to undergo drug or alcohol testing. Supervisors must receive one hour of training on the signs of alcohol abuse and one hour on the signs of drug use.

Notes

Vehicle Maintenance Pro

Notes

Many carriers have their maintenance supervisors undergo this training. This then allows the maintenance supervisors to send drivers that they believe are under the influence of controlled substances or alcohol (based on observations) for a reasonable suspicion test.

Like the educational materials provided to drivers, this training only has to be provided once. If you have proof that another employer has trained one of your supervisors, you do not *have* to train him or her again. However, it makes sense to keep your supervisors' observational skills sharp by providing your own training, and by providing it on a recurring basis.

You must maintain documentation of this training until two years after the supervisor stops performing the functions of a supervisor.

Part 383 tells you who needs a commercial driver's license (CDL), how to obtain one, and how to lose one. In other words, it governs the issuance of CDLs and the *disqualification* of licensed drivers who violate safety regulations. As with Part 382, everything in Part 383 applies to your technicians that occasionally drive a commercial vehicle requiring a CDL to operate.

Much of this Part applies to the states, which are charged with implementing the federal CDL regulations and issuing driver's licenses. However, motor carriers operating vehicles that require CDLs must be familiar with this Part, and should incorporate portions of the rules and regulations into their policies, training programs, and safety management system.

Part 383 - Commercial Driver's License Standards; Requirements and Penalties, contains 10 Subparts:

- **Subpart A** General Requirements.
- **Subpart B** Single License Requirement.
- **Subpart C** Notification Requirements and Employer Responsibilities.
- **Subpart D** Driver Disqualifications and Penalties.
- **Subpart E** Testing and Licensing Procedures.
- **Subpart F** Vehicle Groups and Endorsements.
- **Subpart G** Required Knowledge and Skills.
- **Subpart H** Tests.
- **Subpart J** Commercial Driver's License Document.

Because portions of Part 383 apply only to the states, we'll discuss only those sections that affect carriers and drivers.

Subpart A — General

As the title implies, Subpart A contains general information that applies to the entire Part, including definitions. It contains the definitions used in this part, and the applicability (states, carriers, and drivers). A new definition in Part 383 is a "CDL downgrade." This is the withdrawal of the driver's CDL driving privileges due to the driver not having provided

Compliance Management

medical information (a copy of the medical card) to the state driver licensing authority (see the earlier information in this chapter on §391.41 for an explanation of the process).

Subpart B — Single License Requirement

Subpart B contains only two sections: one requires that CMV drivers hold a CDL, and the other requires that they only hold a *single* license.

Subpart C — Notification Requirements and Employer Responsibilities

The regulations in Subpart C are aimed at keeping you abreast of your drivers' traffic violations, license suspensions, and driving history.

Your drivers are required to report convictions and suspensions to you. This is where your safety management controls come into play — make sure your written policies clearly state that your drivers are required to report convictions and suspensions to you. We'll go into more detail below, but here is a quick summary of the requirements:

IF your driver:	THEN he or she must:
Is convicted of a traffic violation in any type of vehicle	Notify you within 30 days, supplying specific information in writing.
Has his or her license suspended or otherwise loses the right to drive	Notify you by the end of the business day following the day the driver was notified.

§383.35 Notification of previous employment, closes a loophole and requires that CDL-licensed drivers provide a 10-year employment history on their application for employment.

§383.37 Employer responsibilities, contains some general, common-sense prohibitions directed at the employer. In simple terms, you can't let a driver operate a CMV if he or she has an invalid license or has been disqualified, is subject to an out-of-service order, or is violating a railroad-highway grade crossing rule.

Subpart D — Driver Disqualifications and Penalties

This subpart concerns *disqualification*, and you and your drivers must be familiar with the violations that can result in disqualification, because a disqualified driver must not get behind the wheel. It describes “major” violations, which are ones that can result in immediate disqualification, and “serious” violations, which, when combined with another serious violation within a three year time span, can result in the driver being disqualified.

Notes

Vehicle Maintenance Pro

Notes

Which offenses can result in disqualification? The following table summarizes the four categories of offenses, what they include, and the disqualification period that can result:

CATEGORY	INCLUDES	PERIOD
Major offenses	DUI/DWI, refusing to take an alcohol test, leaving an accident scene, using a vehicle to commit a felony, causing a fatality through negligent driving, etc.	1 year to life
Serious traffic violations	Speeding (15+ mph over limit), reckless driving, following too closely, driving without a CDL or the proper endorsement, etc.	60-120 days
Railroad-highway grade crossing offenses	Failing to slow down or stop when required, failing to leave enough space in front of or underneath vehicle, failing to obey traffic control device, etc.	60 days to 1 year or more
Violations of out-of-service orders	Violating a driver or vehicle out-of-service order	90 days to 5 years

Subpart F — Vehicle Groups and Endorsements

Subpart F provides the regulations on vehicle classes and endorsements. Drivers are required to have a CDL with the correct class and endorsement when they are operating the vehicle on a public roadway. The “roadway” is defined as any roadway to which the public has unrestricted access. In some cases parking lots qualify as roadways!

Compliance reviews

Section 215 of the Motor Carrier Safety Act of 1984 directed the Secretary of Transportation, in cooperation with the Interstate Commerce Commission, to establish a procedure to determine the safety fitness of owners and operators of commercial motor vehicles operating in interstate or foreign commerce. The Secretary, in turn, delegated this responsibility to the Federal Highway Administration (FHWA). When the FHWA was replaced by the Federal Motor Carrier Safety Administration (FMCSA) in 2000, the new agency took over the investigation of motor carrier safety.

The “Safety Fitness Procedures” established a system to determine the safety fitness of motor carriers through the assignment of safety ratings and established a “safety fitness standard” which motor carriers must meet to obtain a satisfactory safety rating.

To meet the safety fitness standard, a motor carrier must demonstrate to the FMCSA that it has adequate safety management controls in place which function effectively to ensure acceptable compliance with the applicable safety requirements. A “safety rating methodology” (SFRM) was developed which uses data from compliance reviews (CRs) to rate motor carriers.

Compliance Management

The safety rating process used by the FMCSA evaluates safety fitness and assigns one of three safety ratings (satisfactory, conditional or unsatisfactory) to motor carriers operating in interstate commerce. This process conforms with 49 CFR Part 385.

The process also identifies motor carriers needing improvement in their compliance with the Federal Motor Carrier Safety Regulations (FMCSRs) and applicable Hazardous Material Regulations (HMRs). These are carriers rated unsatisfactory or conditional.

The compliance review (CR) is an in-depth examination of a motor carrier's operations and is used 1) to rate unrated motor carriers, 2) to conduct a follow-up investigation on motor carriers rated unsatisfactory or conditional as a result of a previous review, 3) to investigate complaints, or 4) in response to a request by a motor carrier to reevaluate its safety rating.

Since December 2010, a performance-based system called the Safety Measurement System (SMS), a component of the Compliance Safety Accountability (CSA) program, has been the major source for selecting carriers for compliance reviews. The SMS combines data from roadside inspections, previous compliance reviews, and state-reported accidents to build a picture of a carrier's relative safety status compared to other carriers. Carriers that appear to pose the greatest potential risk to highway safety are placed at the top of the priority list for compliance reviews.

Notes

Vehicle Maintenance Pro

Reserved

Compliance Management

During the compliance review, documents such as those contained in driver qualification files, records of duty status, and vehicle maintenance records are thoroughly examined for compliance with the FMCSRs and HMRs. Violations are cited on the CR document. Performance-based information, when available, is utilized to evaluate the carrier's compliance with the vehicle regulations. Recordable preventable accident information is also collected.

The FMCSA gathers information through an in-depth examination of the motor carrier's compliance with identified acute or critical regulations of the FMCSRs and HMRs.

"Acute" are those identified regulations, where noncompliance is so severe as to require immediate corrective actions by a motor carrier regardless of the overall safety posture of the motor carrier. An example of an acute regulation is Sec. 383.37(b) — Knowingly allowing, requiring, permitting, or authorizing an employee with more than one commercial driver's license to operate a commercial motor vehicle. Noncompliance with Sec. 383.37(b) is usually discovered when the motor carrier's driver qualification file reflects that the motor carrier had knowledge of a driver with more than one commercial driver's license, and still permitted the driver to operate a commercial motor vehicle. If the motor carrier did not have knowledge or could not reasonably be expected to have knowledge, then a violation would not be cited.

"Critical" are those identified regulations, where noncompliance relates to management and/or operational controls. These are indicative of breakdowns in a carrier's management controls. An example of a critical regulation is Sec. 395.3(a) (1) — Requiring or permitting a driver to drive more than 10 hours.

See Attachment A below for a list of the acute and critical regulations pertaining to maintenance which are used in determining safety ratings.

Noncompliance with acute regulations and patterns of noncompliance with critical regulations are quantitatively linked to inadequate safety management controls and usually higher than average rates of recordable preventable accidents. The FMCSA has used noncompliance with acute regulations and patterns of noncompliance with critical regulations since 1989 to determine motor carriers' adherence to the Sec. 385.5 — Safety fitness standard.

Compliance with the regulatory factors, 1) Parts 387 and 390; 2) Parts 382, 383 and 391; 3) Parts 392 and 395; 4) Parts 393 and 396, when there are less than 3 vehicle inspections in the last 12 months to evaluate; and 5) Parts 397 and 177, will be evaluated as follows:

For each instance of noncompliance with an acute regulation or each pattern of noncompliance with a critical regulation during the CR, one point will be assessed. A pattern is more than one violation. When large numbers of documents are reviewed, the number of violations required to meet a pattern is equal to at least 10 percent of those examined. However, each pattern of noncompliance with a critical regulation relative to Part 395, Hours of Service of Drivers, will be assessed two points.

Notes

Vehicle Maintenance Pro

Notes

The Vehicle Factor

When there are a combination of three or more inspections recorded in the Motor Carrier Management Information System (MCMIS) during the twelve months prior to the CR or performed at the time of the review, the Vehicle Factor (Parts 393 and 396) will be evaluated on the basis of the Out-of-Service (OOS) rates and noncompliance with acute regulations and/or a pattern of noncompliance with critical regulations. The results of the review of the OOS rate will affect the Vehicle Factor rating as follows:

- If a motor carrier has three or more roadside vehicle inspections in the twelve months prior to the carrier review, or three vehicles inspected at the time of the review, or a combination of the two totaling three or more, and the vehicle OOS rate is 34% or greater, the initial factor rating will be conditional. The Part 396 — Inspection, Repair, and Maintenance systems requirements will be examined during each review. The results of the examination could lower the factor rating to unsatisfactory if noncompliance with an acute regulation or a pattern of noncompliance with a critical regulation is discovered. If the examination of the Part 396 requirements discovers no such problems with the systems the motor carrier is required to maintain for compliance, the Vehicle Factor remains conditional.
- If a carrier's vehicle OOS rate is less than 34%, the initial factor rating will be satisfactory. If noncompliance with an acute regulation or a pattern of noncompliance with a critical regulation is discovered during the examination of the Part 396, the factor rating will be lowered to conditional. If the examination of the Part 396 requirements discovers no such problems with the systems the motor carrier is required to maintain for compliance, the Vehicle Factor remains satisfactory.

Over 3 million vehicle inspections occur on the roadside each year. This vehicle inspection information is retained in the MCMIS and is integral to evaluating motor carriers' ability to successfully maintain their vehicles, thus preventing them from being placed OOS during roadside inspections. Since many of the roadside inspections are targeted to visibly defective vehicles and since there are a limited number of inspections for many motor carriers, the use of data is limited. Each CR will continue to have the Part 396 — Inspection, Repair, and Maintenance requirements reviewed as indicated by the above explanation.

Accident factor

In addition to the five regulatory rating factors, a sixth factor is included in the process to address the accident history of the motor carrier. This factor is the recordable accident rate which the carrier has experienced during the past 12 months.

The definition of a recordable accident is found in Sec. 390.5. Under the definition, a recordable accident means an occurrence involving a commercial vehicle where there is 1) a fatality; 2) bodily injury that requires one or more persons to receive immediate medical treatment away from

Compliance Management

the accident scene; or 3) disabling damage to one or more vehicles requiring any vehicle to be towed or otherwise transported away from the scene.

The recordable accident rate is how many recordable accidents occurred per million miles the carrier operated. To calculate the recordable accident rate, the number of recordable accidents is multiplied by 1 million and then divided by the total number of miles operated by the carrier in the 365 days prior to the compliance review.

The accident factor will be rated either satisfactory or unsatisfactory — no conditional ratings are given. An urban carrier with a recordable accident rate greater than 1.7 will be rated unsatisfactory in this factor. Carriers that operate entirely within a 100 air-mile radius are considered urban carriers and are allowed a higher accident rate tolerance because they generally have a higher exposure to accident situations because of their environment.

For all other carriers, a recordable accident rate greater than 1.5 will be considered unsatisfactory.

The cut-off rates were determined by roughly doubling the national average accident rate for each type of carrier rated in fiscal years 1994, 1995 and 1996.

Rate Adjustments: The accident rate breakpoints are reexamined periodically to determine if adjustments are needed.

Factor ratings

In the methodology, parts of the FMCSRs and the HMRs having similar characteristics are combined together into five regulatory areas called “factors.”

The following table shows the five regulatory factors, parts of the FMCSRs and HMRs associated with each factor, and the accident factor.

Factors

Factor 1 General	=	Parts 387 & 390
Factor 2 Driver	=	Parts 382, 383 & 391
Factor 3 Operational	=	Parts 392 & 395
Factor 4 Vehicle	=	Parts 393 & 396
Factor 5 Haz Mat	=	Parts 397 & 177
Factor 6 (Accident Factor)	=	Recordable Preventable Rate

Factor Ratings are determined as follows:

Satisfactory if the acute and/or critical = 0 points

Conditional if the acute and/or critical = 1 point

Unsatisfactory if the acute and/or critical = 2 or more points

Notes

Vehicle Maintenance Pro

Notes

Safety rating

The ratings for the five factors, along with the recordable accident rate for the 12 months prior to the review, are then entered into a rating table which establishes the motor carrier's safety rating.

The FMCSA has developed a rating formula for assessing the information obtained from the CR document and is using that formula in assigning a safety rating.

Motor carrier safety rating table

Factor Ratings		Overall
Unsatisfactory	Conditional	Safety Rating
0	2 or less	Satisfactory
0	More than 2	Conditional
1	2 or less	Conditional
1	More than 2	Unsatisfactory
2 or more	0 or more	Unsatisfactory

Proposed safety rating

Within 30 days of the compliance review, the carrier will receive written notification of the proposed safety rating. This written notification will appear on a compliance review document, MCS-151, Part B. The notification will include one of the following messages.

"Your proposed safety rating is SATISFACTORY," or;

"Your proposed safety rating is CONDITIONAL." The proposed rating will become the final rating 45/60 days after you receive this notice.

"Your proposed safety rating is UNSATISFACTORY." The proposed safety rating will become the final safety rating 45/60 days after you receive this notice.

Assignment of Rating/Motor carrier notification

When the official rating is determined in Washington, D.C., the FHWA notifies the motor carrier in writing of its safety rating as prescribed in Sec. 385.11. Notification of a conditional or unsatisfactory rating includes a list of those Parts of the regulations, or recordable preventable accident rate for which corrective actions must be taken by the motor carrier to improve its overall safety performance.

If the proposed safety rating is unsatisfactory, the motor carrier will be informed that Sec. 385.13 prohibits carriers rated unsatisfactory from transporting hazardous materials requiring placarding or more than 15 passengers including the driver.

Motor carrier rights to a change in the safety rating

Under Sec. 385.15 and 385.17, motor carriers have the right to petition for a review of their ratings if there are factual or procedural disputes, and to request another review after corrective actions have been taken. These two sections should be read carefully. They are the procedural

Compliance Management

avenues a motor carrier which believes its safety rating to be in error may exercise, and the means to request another review after corrective action has been taken.

Conclusion

The FMCSA believes this “safety rating methodology” is a reasonable approach for assigning a safety rating which best describes the current safety fitness posture of a motor carrier as required by the safety fitness regulations (Sec. 385.9). This methodology has the capability to incorporate regulatory changes as they occur.

Improved compliance with the regulations leads to an improved rating, which in turn increases safety. This increased safety is FMCSA’s regulatory goal.

Attachment A

Acute and critical regulations pertaining to maintenance

§396.3(b)	Failing to keep minimum records of inspection and vehicle maintenance. (critical)
§396.9(c)(2)	Requiring or permitting the operation of a motor vehicle declared “out-of-service” before repairs were made. (acute)
§396.11(a)	Failing to require driver to prepare driver vehicle inspection report. (critical)
§396.11(c)	Failing to correct out-of-service defects listed by driver in a driver vehicle inspection report before the vehicle is operated again. (acute)
§396.17(a)	Using a commercial motor vehicle not periodically inspected. (critical)
§396.17(g)	Failing to promptly repair parts and accessories not meeting minimum periodic inspection standards. (acute)

Compliance Management OSHA	Notes
Overview Occupational Safety and Health Administration (OSHA) Just as the EPA is primarily concerned with protection of the environment, OSHA is primarily concerned with workplace safety and health. Following you will find some general information about the agency and how it functions, and a roundup of employer and employee rights and responsibilities under the Occupational Safety & Health Act. Need for legislation More than 90 million Americans spend their days on the job. They are our most valuable national resource. Yet, until 1970, no uniform and comprehensive provisions existed for their protection against workplace safety and health hazards. In 1970, Congress considered annual figures such as these: • Job-related accidents accounted for more than 14,000 worker deaths. • Nearly 2½ million workers were disabled. • Ten times as many person-days were lost from job-related disabilities as from strikes. • Estimated new cases of occupational diseases totaled 300,000. In terms of lost production and wages, medical expenses, and disability compensation, the burden on the nation's commerce was staggering. Human cost was beyond calculation. Therefore, the Occupational Safety and Health Act (OSHA Act) of 1970 was passed by a bipartisan Congress "...to assure so far as possible every working man and woman in the Nation safe and healthful working conditions and to preserve our human resources." OSHA's purpose Under the Act, the Occupational Safety and Health Administration (OSHA) was created within the Department of Labor to: • Encourage employers and employees to reduce workplace hazards and to implement new or improve existing safety and health programs.	

Vehicle Maintenance Pro

Notes

- Provide for research in occupational safety and health to develop innovative ways of dealing with occupational safety and health problems.
- Establish “separate but dependent responsibilities and rights” for employers and employees for the achievement of better safety and health conditions.
- Maintain a reporting and recordkeeping system to monitor job-related injuries and illnesses.
- Establish training programs to increase the number and competence of occupational safety and health personnel.
- Develop mandatory job safety and health standards and enforce them effectively.
- Provide for the development, analysis, evaluation and approval of state occupational safety and health programs.

While OSHA continually reviews and redefines specific standards and practices, its basic purposes remain constant. OSHA strives to implement its Congressional mandate fully and firmly with fairness to all concerned.

In all its procedures, from standards development through implementation and enforcement, OSHA guarantees employers and employees the right to be fully informed, to participate actively, and to appeal actions.

The Act’s coverage

In general, coverage of the Act extends to all employers and their employees in the 50 states, the District of Columbia, Puerto Rico, and all other territories under Federal Government jurisdiction. Coverage is provided either directly by federal OSHA or through an OSHA-approved state program.

As defined by the Act, an employer is any “person engaged in a business affecting commerce who has employees, but does not include the United States or any State or political subdivision of a State.”

Therefore, the Act applies to employers and employees in such varied fields as manufacturing, construction, longshoring, agriculture, law and medicine, charity and disaster relief, organized labor, and private education. Such coverage includes religious groups to the extent that they employ workers for secular purposes.

The following are not covered under the Act:

- Self-employed persons.
- Farms at which only immediate members of the farm employer’s family are employed.
- Workplaces already protected by other federal agencies under other federal statutes.

Compliance Management

Even when another federal agency is authorized to regulate safety and health working conditions in a particular industry, if it does not do so in specific areas, then OSHA standards apply.

Over the years there has been considerable confusion about the applicability of the OSHA regulations when it comes to motor carriers. The easiest way to clarify the relationship between the Department of Transportation (DOT) regulations and the OSHA regulations is if DOT and OSHA both have rules covering a specific activity a driver is undertaking, the driver is subject to the DOT rules. Drivers working at the fixed facility would be subject to the OSHA rules. Other employees who are not directly controlled by DOT regulations, such as technicians, are always subject to the OSHA rules.

If there is no applicable DOT regulation concerning what the driver or employee is doing, then the OSHA regulations must be followed. Therefore, if a driver gets out of the vehicle and starts working in the repair shop, as far as OSHA is concerned he/she has just become a covered employee.

This is an important point to remember. Each year motor carriers are fined by OSHA for a variety of violations, including violating standards related to:

- Hazard communication
- Powered industrial trucks (forklifts and other material handling equipment)
- Electrical: wiring methods, components, and equipment
- Electrical: systems design
- Machine guarding
- Control of hazardous energy (lockout/tagout, including making sure vehicles being worked on cannot be moved by another person)
- Respiratory protection
- Fall protection

However, motor carriers generally receive the largest fines for violating the “whistleblower protections” afforded to all employees by OSHA. If a driver, technician, or other employee at a motor carrier refuses to participate in an unsafe activity, raises a safety concern to the company, contacts a regulating agency with a safety concern, or cooperates with an agency investigation, the employer cannot retaliate in any way.

To give you an idea of the fines and penalties that can be assessed under the whistleblower protections, it is not uncommon for a company to be ordered to pay \$100,000 or more in backpay (lost wages), interest, and penalties for firing an employee who either refused to follow instructions or orders that were not safe, or who reported a safety concern.

Rights and responsibilities under OSHA

Employer responsibilities and rights

Employers have certain responsibilities and rights under the Occupational Safety and Health Act of 1970. The checklists which follow provide a review of many of these. States with their own occupational safety and health programs must be at least as stringent as OSHA, but may have additional requirements.

Responsibilities

As an employer under federal OSHA, you must:

- Meet your general duty responsibility to provide a workplace free from recognized hazards that are causing or are likely to cause death or serious physical harm to employees, and comply with standards, rules, and regulations issued under the Act.
- Be familiar with mandatory OSHA standards and make copies available to employees for review upon request.
- Inform all employees about OSHA.
- Examine workplace conditions to make sure they conform to applicable standards.
- Minimize or reduce hazards. Part of this is doing an assessment of the workplace and then documenting hazards and efforts to minimize them.
- Make sure employees have and use safe tools and equipment (including appropriate personal protective equipment), and that such equipment is properly maintained.
- Provide any personal protective equipment that is unique to the work place.
- Use color codes, posters, labels or signs when needed to warn employees of potential hazards.
- Establish or update operating procedures and communicate them so that employees follow safety and health requirements.
- Provide training as required in the OSHA standards.
- Provide medical examinations when required by OSHA standards.
- Report to the nearest OSHA office within 8 hours any fatal accident or one which results in the hospitalization of three or more employees.
- Keep records of work-related injuries and illnesses (using OSHA Form 300 Log of Work-Related Injuries and Illnesses, and OSHA Form 301 Injury and Illness Incident Report). Below you will find a decision flow chart explaining how to decide which injuries must be recorded.

Compliance Management

- Post a copy of the totals from the last page of OSHA Form No. 300 on OSHA Form No. 300A Summary, from February 1 to April 1 each year (this applies to employers with 11 or more employees) Samples of OSHA forms 300, 300A, and 301 are included below.
- Post, at a prominent location within the workplace, either OSHA poster (OSHA 2203 or OSHA 3165) informing employees of their rights and responsibilities. (In states operating OSHA-approved job safety and health programs, the state's equivalent poster may be required.)
- Provide employees, former employees, and their representatives access to the Log and Summary of Occupational Injuries and Illnesses (OSHA No. OSHA 300 and 300A) at a reasonable time and in a reasonable manner.
- Provide access to employee medical records and exposure records.
- Cooperate with the OSHA compliance officer by furnishing names of authorized employee representatives who may be asked to accompany the compliance officer during an inspection. (If none, the compliance officer will consult with a reasonable number of employees concerning safety and health in the workplace.)
- Not discriminate against employees who properly exercise their rights under the Act.
- Post OSHA citations at or near the worksite involved. Each citation, or copy thereof, must remain posted until the violation has been abated, or for three working days, whichever is longer.
- Abate (eliminate) cited violations within the prescribed period.

Notes

Vehicle Maintenance Pro

Reserved

Compliance Management

One set of criteria is used to determine if work-related injuries and illnesses are recordable (this is covered on the flowchart at the step entitled “Does this illness or injury meet the general recording criteria or the application to specific cases”). Any work-related injury or illness resulting in one of the following must be recorded on an incident report (OSHA Form 301), and on the Log and Summary forms (OSHA Form 300 and OSHA Form 300A):

- Death;
- Days away from work;
- Restricted work or transfer to another job;
- Medical treatment beyond first aid;
- Loss of consciousness; or
- Diagnosis of a significant injury/illness by a physician or other licensed health care professional.

Notes

6

OSHA's Form 301
Injury and Illness Incident Report

This *Injury and Illness Incident Report* is one of the first forms you must fill out when a recordable work-related injury or illness has occurred. Together with the *Log of Work-Related Injuries and Illnesses* and the accompanying *Summary*, these forms help the employer and OSHA develop a picture of the extent and severity of work-related incidents.

Within 7 calendar days after you receive information that a recordable work-related injury or illness has occurred, you must fill out this form or an equivalent. Some state workers' compensation, insurance, or other reports may be acceptable substitutes. To be considered an equivalent form, any substitute must contain all the information asked for on this form.

According to Public Law 91-596 and 29 CFR 1904, OSHA's recordkeeping rule, you must keep this form on file for 5 years following the year to which it pertains.

If you need additional copies of this form, you may photocopy and use as many as you need.

Completed by _____ Date ____/____/____
Title _____
Phone (____) _____

Information about the employee

- 1) Full name _____
2) Street _____
City _____ State _____ ZIP _____
3) Date of birth ____/____/____
4) Date hired ____/____/____
5) ☐ Male ☐ Female

Information about the physician or other health care professional

- 6) Name of physician or other health care professional _____
7) If treatment was given away from the worksite, where was it given?
Facility _____
Street _____
City _____ State _____ ZIP _____

- 8) Was employee treated in an emergency room?
☐ Yes ☐ No
9) Was employee hospitalized overnight as an in-patient?
☐ Yes ☐ No

Attention: This form contains information relating to employee health and must be used in a manner that protects the confidentiality of employees to the extent possible while the information is being used for occupational safety and health purposes.

U.S. Department of Labor
Occupational Safety and Health Administration

Form approved OMB no. 1218-0176

Information about the case

- 10) Case number from the Log _____ (Transfer the case number from the Log after you record the case.)
11) Date of injury or illness ____/____/____
12) Time employee began work ____ AM / PM
13) Time of event ____ AM / PM ☐ Check if time cannot be determined

14) **What was the employee doing just before the incident occurred?** Describe the activity, as well as the tools, equipment, or material the employee was using. Be specific. *Examples:* "climbing a ladder while carrying roofing materials"; "spraying chlorine from hand sprayer"; "daily computer key-entry."

15) **What happened?** Tell us how the injury occurred. *Examples:* "When ladder slipped on wet floor, worker fell 20 feet"; "Worker was sprayed with chlorine when gasket broke during replacement"; "Worker developed soreness in wrist over time."

16) **What was the injury or illness?** Tell us the part of the body that was affected and how it was affected; be more specific than "hurt," "pain," or "sore." *Examples:* "strained back"; "chemical burn, hand"; "carpal tunnel syndrome."

17) **What object or substance directly harmed the employee?** *Examples:* "concrete floor"; "chlorine"; "radial arm saw." If this question does not apply to the incident, leave it blank.

18) **If the employee died, when did death occur?** Date of death ____/____/____

Public reporting burden for this collection of information is estimated to average 22 minutes per response, including time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Persons are not required to respond to the collection of information unless it displays a current valid OSHA control number. If you have any comments about this estimate or any other aspects of this data collection, including suggestions for reducing this burden, contact: U.S. Department of Labor, OSHA Office of Statistical Analysis, Room N-3614, 200 Constitution Avenue, NW, Washington, DC 20210. Do not send the completed form to this office.

Notes

OSHA's Form 300A (Rev. 01/2004)

Summary of Work-Related Injuries and Illnesses

All establishments covered by Part 1904 must complete this Summary page, even if no work-related injuries or illnesses occurred during the year. Remember to review the Log to verify that the entries are complete and accurate before completing this summary.

Using the Log, count the individual entries you made for each category. Then write the totals below, making sure you've added the entries from every page of the Log. If you had no cases, write "0."

Employees, former employees, and their representatives have the right to review the OSHA Form 300 in its entirety. They also have limited access to the OSHA Form 301 or its equivalent. See 29 CFR Part 1904.35; in OSHA's recordkeeping rule, for further details on the access provisions for these forms.

Company executive	Title

Compliance Management

Rights

As an employer, you have the right to:

- Seek advice and off-site consultation as needed by writing, calling, or visiting the nearest OSHA Office. (OSHA will not inspect merely because an employer requests assistance.)
- Be active in your industry association's involvement in job safety and health.
- Request and receive proper identification of the OSHA compliance officer prior to inspection.
- Be advised by the compliance officer of the reason for an inspection.
- Have an opening and closing conference with the compliance officer.
- Have a company OSHA compliance officer present during an inspection.
- File a Notice of Contest with the OSHA area director within 15 working days of receipt of a notice of citation and proposed penalty.
- Apply to OSHA for a temporary variance from a standard if unable to comply because of the unavailability of materials, equipment, or personnel needed to make necessary changes within the required time.
- Apply to OSHA for a permanent variance from a standard if you can furnish proof that your facilities or method of operation provide employee protection at least as effective as that required by the standard.
- Take an active role in developing safety and health standards through participation in OSHA Standards Advisory Committees, through nationally recognized standards-setting organizations, and through evidence and views presented in writing or at hearings.
- Be assured of the confidentiality of any trade secrets observed by an OSHA compliance officer during an inspection.
- Submit a written request to NIOSH for information on whether any substance in your workplace has potentially toxic effects in the concentrations being used.

Employee responsibilities and rights

Although OSHA does not cite employees for violations of their responsibilities, each employee "shall comply with all occupational safety and health standards and all rules, regulations, and orders issued under the Act" that are applicable. Employee responsibilities and rights in states with their own occupational safety and health programs are generally the same as for workers in federal OSHA states.

Notes

Vehicle Maintenance Pro

Notes

Responsibilities

Employees should:

- Read the OSHA poster at the jobsite.
- Comply with all applicable OSHA standards.
- Follow all employer safety and health rules and regulations, and wear or use prescribed protective equipment while engaged in work.
- Report hazardous conditions to the supervisor.
- Report any job-related injury or illness to the employer, and seek treatment promptly.
- Cooperate with the OSHA compliance officer conducting an inspection if he or she inquires about safety and health conditions in your workplace.
- Exercise their rights under the Act in a responsible manner.

11(c) rights: Protection for using rights

Employees have a right to seek safety and health on the job without fear of punishment. That right is spelled out in Section 11(c) of the Act.

The law says employers shall not punish or discriminate against workers for exercising rights such as:

- Complaining to an employer, union, OSHA, or any other government agency about job safety and health hazards.
- Filing safety or health grievances.
- Participating on a workplace safety and health committee or in union activities concerning job safety and health.
- Participating in OSHA inspections, conferences, hearings, or other OSHA-related activities.

If an employee is exercising these or other OSHA rights, the employer is not allowed to discriminate against that worker in any way, such as through firing, demotion, taking away seniority or other earned benefits, transferring the worker to an undesirable job or shift, or threatening or harassing the worker.

If the employer has knowingly allowed the employee to do something in the past (such as leaving work early), he or she may be violating the law by punishing the worker for doing the same thing following a protest of hazardous conditions. If the employer knows that a number of workers are doing the same thing wrong, he or she cannot legally single out for punishment the worker who has taken part in safety and health activities.

Workers believing they have been punished for exercising safety and health rights must contact the nearest OSHA office within 30 days of the time they learn of the alleged discrimination. A union representative can file the 11(c) complaint for the worker.

Compliance Management

Section 405 of the Surface Transportation Assistance Act (STAA) was enacted on January 6, 1983, and provides protection from reprisal by employers for truckers and certain other employees in the trucking industry involved in activity related to interstate commercial motor vehicle safety and health. Secretary of Labor's Order No. 9-83 (48 FR 35736, August 5, 1983) delegated to the Assistant Secretary of OSHA the authority to investigate and to issue findings and preliminary orders under Section 405.

Employees who believe they have been discriminated against for exercising their rights under Section 405 can file a complaint with OSHA within 180 days of the incident. The Secretary will then investigate the complaint, and within 60 days after it was filed, issue findings as to whether there is a reason to believe Section 405 has been violated.

If the Secretary finds that a complaint has merit, he/she also will issue an order requiring, where appropriate, abatement of the violation, reinstatement with back pay and related compensation, payment of compensatory damages, and the payment of the employee's expenses in bringing the complaint. Either the employee or employer may object to the findings. If no objection is filed within 30 days, the findings and order are final. However, if a timely-filed objection is made, the objecting party is entitled to a hearing on the objection before an Administrative Law Judge of the Department of Labor.

Within 120 days of the hearing the Secretary will issue a final order. A party aggrieved by the final order may seek judicial review in a court of appeals within 60 days of the final order.

The following activities of truckers and certain employees involved in interstate commercial motor vehicle operation are protected under Section 405:

- Filing of safety or health complaints with OSHA or other regulatory agency relating to a violation of a commercial motor vehicle safety rule, regulation, standard, or order.
- Instituting or causing to be instituted any proceedings relating to a violation of a commercial motor vehicle safety rule, regulation, standard, or order.
- Testifying in any such proceedings relating to the above items.
- Refusing to operate a vehicle when such operation constitutes a violation of any Federal rules, regulations, standards, or orders applicable to commercial motor vehicle safety or health; or because of the employee's reasonable apprehension of serious injury to himself or the public due to the unsafe condition of the equipment.
- Complaining directly to management about job safety or health conditions relating to commercial motor vehicle operation.

Complaints under Section 405 are filed in the same manner as complaints under 11(c). The filing period for Section 405 is 180 days from the alleged discrimination, rather than 30 days as under Section 11(c).

Notes

Vehicle Maintenance Pro

Notes

The worker does not have to complete any forms. An OSHA staff member will complete the forms, asking what happened and who was involved.

Following a complaint, OSHA investigates. If an employee has been illegally punished for exercising safety and health rights, OSHA asks the employer to restore that worker's job earning and benefits. If necessary, and if it can prove discrimination, OSHA takes the employer to court. In such cases the worker does not pay any legal fees.

If a state agency has an OSHA-approved state program, employees may file their complaint with either federal OSHA or the state agency under its laws.

Other rights

Employees also have the right to:

- Review copies of appropriate OSHA standards, rules, regulations and requirements that the employer should have available at the workplace.
- Request information from their employer on safety and health hazards in the area, on precautions that may be taken, and on procedures to be followed if an employee is involved in an accident or is exposed to toxic substances.
- Receive adequate training and safety information.
- Request the OSHA area director to conduct an inspection if you believe hazardous conditions or violations of standards exist in your workplace.
- Have their names withheld from employers if they file a written and signed complaint, if so requested.
- Be advised of OSHA actions regarding complaints and have an informal review, if requested, of any decision not to inspect or to issue a citation.
- Have an authorized employee representative accompany the OSHA compliance officer during the inspection tour.
- Respond to questions from the OSHA compliance officer, particularly if there is no authorized employee representative accompanying the compliance officer.
- Observe any monitoring or measuring of hazardous materials and have the right to see these records, as specified under the Act.
- Review, or have an authorized representative review, the Log and Summary of Occupational Injuries (OSHA No. 200, 300/300A) at a reasonable time and in a reasonable manner.
- Request a closing discussion with the compliance officer following an inspection.

Compliance Management

- Submit a written request to NIOSH for information on whether any substance in the workplace has potentially toxic effects in the concentration being used, and have names withheld from the employer if so requested.
- Object to the abatement period set in the citation issued to an employer by writing to the OSHA area director within 15 working days of the issuance of the citation.
- Be notified by their employer if the employer applies for a variance from an OSHA standard, and testify at a variance hearing, and appeal the final decision.
- Submit information or comment to OSHA on the issuance, modification, or revocation of OSHA standards and request a public hearing.

OSHA and the General Duty Clause

A single sentence contained in the Occupational Safety and Health Act of 1970 has been used increasingly by OSHA in the last years in enforcement and penalty actions. The following section describes that clause and how OSHA uses it.

What is the General Duty Clause?

Section 5(a)(1) of the Occupational Safety and Health Act of 1970 requires that every working man and woman must be provided with a safe and healthful workplace. The section, more commonly known as the General Duty Clause, specifically states:

“Each employer shall furnish to each of his employees employment and a place of employment which is free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees.”

In simple terms, this statement means that you, as an employer, may be obligated to protect your employees from recognized hazards in the workplace even if there is not an OSHA standard which applies to the situation or if hazards still exist after compliance with a standard. In effect, the General Duty Clause obligates employers to take additional steps toward safety if the well-being of employees is in jeopardy.

How does OSHA use the General Duty Clause?

The General Duty Clause extends OSHA's authority beyond the specific requirements of the OSHA standards when a recognized workplace hazard exists or potentially exists. From January 1, 2006, through December 31, 2006, the General Duty Clause was used as the basis for over 1,361 OSHA citations. Over \$805,000 in adjusted penalties were collected as a result of these citations. The General Duty Clause is often used by OSHA when there is no specific standard which applies to a recognized hazard in the workplace. OSHA may also use the General Duty Clause when a standard exists, but it is clear that the hazards

Notes

Vehicle Maintenance Pro

Notes

involved warrant additional precautions beyond what the current safety standards require.

OSHA's action on ergonomic hazards in the workplace is a good example of the application of the General Duty Clause in situations where a standard does not currently exist. There are no standards governing job or work station design to reduce or prevent cumulative trauma disorders or other injuries. However, OSHA has widely applied the General Duty Clause to address ergonomic hazards in the workplace. Typically in these situations, OSHA will discover ergonomic-related problems while reviewing a company's accident and injury records. The highly publicized citations issued to several meatpacking plants for cumulative trauma disorders are an example of the use of the General Duty Clause to correct ergonomic hazards. The action in this area eventually led to the issuance of ergonomic guidelines for the meatpacking industry and consideration of a standard for the general industry.

OSHA has also issued General Duty Clause citations on other issues where no apparent safety standard exists. Citations have been issued for lack of training, failure to have additional safety or alarm equipment to detect or warn of chemical leaks, and failure to provide safe locations or safe access to valves or other instruments necessary to an employee's job.

What about situations where a safety standard currently exists on a particular subject? Are you doing enough if you are in compliance with OSHA's safety standard? The answer, unfortunately, is maybe not. OSHA has also used the General Duty Clause to cite employers who knew that an OSHA standard was inadequate to protect their employees from harm.

At least one Circuit Court decision (*International Union UAW v. General Dynamics*, 815 F.2d 1570, D.C. Cir. 1987) has validated OSHA's use of the General Duty Clause in this manner. In this situation, after several injuries and eventually a death involving the use of freon in confined spaces, OSHA cited General Dynamics under the General Duty Clause for not having a confined space procedure in situations where an employee could be asphyxiated or chemically poisoned by the cleaning compound (freon) being used. General Dynamics appealed the citation to the Occupational Safety and Health Review Commission which ruled in favor of the company noting that since there was a specific OSHA exposure standard for freon (eight-hour time-weighted average), OSHA could not cite the company under the General Duty Clause. The Commission's decision was then reviewed by the Circuit Court of the District of Columbia which decided in favor of OSHA. The court stated that:

“ . . if (as alleged in this case) an employer knows a particular safety standard is inadequate to protect his workers against the specific hazard it is intended to address, or that the conditions in his place of employment are such that the safety standards will not adequately deal with the hazards to which his employees are exposed, he has a duty under Section 5(a)(1) to take whatever measures may be required by the Act, over and above those mandated by the safety standard, to safeguard his workers.”

Compliance Management

Conclusion

Section 5(a)(1) of the Occupational Safety and Health Act of 1970 places additional responsibilities on the employer and the safety manager to ensure that a safe work environment is provided to all employees. The General Duty Clause is being increasingly applied to a wide variety of situations, many of which have not been addressed by a specific OSHA standard. What may be even more disconcerting, however, is that general duty citations can also be issued if OSHA feels that additional safety equipment or procedures are necessary beyond what is required in an OSHA standard. Thus, the General Duty Clause is making it increasingly difficult for companies to fully comply with OSHA's requirements.

One way to deal with the increasing threat of general duty violations is to make good faith efforts to correct existing workplace hazards and continually assess the workplace to identify and address new hazards as they appear. Some steps you can take to accomplish this goal include:

- Regularly review your accident and injury records to identify injury patterns or areas for concern.
- Investigate every accident, injury, or near-miss in the workplace to determine the specific cause and to determine whether any action needs to be taken to prevent the accident or injury from recurring.
- Conduct job hazard analyses on a regular basis in order to identify the specific hazards associated with every job and to identify new job hazards.
- Document your training efforts and conduct periodic retraining as necessary.
- Consider establishing an employee safety committee in the workplace.

One final thought on the General Duty Clause. When you have met the letter of the law, step back, and critically assess whether some processes might still be unsafe. If there are, you may need to go beyond the letter of the law to provide the employees with a safe worksite. If you do not, you may fall victim to the General Duty Clause.

Hazard Communications Standard

OSHA developed the Hazard Communication Standard (HCS) to protect workers in all industries from dangerous exposures to hazardous materials. The standard was originally based on a simple concept — that employees have both a need and a right to know about the hazards and identities of the chemicals they are exposed to when working. In 2012, OSHA changed the HCS drastically, using the concept that the employees have a “right to understand” about the hazards of chemicals they are exposed to. They also need to know what they can do to protect themselves.

The HCS establishes uniform requirements to make sure that the hazards of all chemicals used in U.S. workplaces are evaluated and classified and that this hazard information is communicated to employers and exposed employees. Basically, the rule incorporates a downstream flow of information. This means that chemical manufacturers have the primary

Notes

Vehicle Maintenance Pro

Notes

responsibility for generating and disseminating information and chemical users must obtain the information and transmit it to their exposed employees.

Evaluating and classifying chemical hazards involves technical concepts and is a process that requires the professional judgement of experienced experts. This is why the rules make it the responsibility of the producers and importers of the materials, who must then pass that information to the purchasers and end-users. The HCS is designed so that employers who simply use chemicals (such as motor carriers) are not required to evaluate the hazards of those substances.

Employers that don't produce or import chemicals need only focus on those parts of the rule that deal with establishing a workplace program and communicating information to their workers.

On March 26, 2012, OSHA published a new rule to align the HCS with a new global system developed by the United Nations, called the Globally Harmonized System of Classification and Labeling of Chemicals (GHS). This important change adapts the HCS into a more uniform way of transmitting information that all chemical manufacturers, importers and distributors, along with employers, must use to communicate the hazards of chemicals to workers.

The rule became effective May 26, 2012; however, there is a phase-in period for certain elements.

Phase-in period for Hazcom 2012

Date	Requirement(s)	Who
December 1, 2013	Train employees on the new label elements and safety data sheet (SDS) format.	Employers
June 1, 2015 December 1, 2015	Compliance with all modified provisions of this final rule, except: The Distributor shall not ship containers labeled by the chemical manufacturer or importer unless it is a GHS label	Chemical manufacturers, importers, distributors and employers
June 1, 2016	Update alternative workplace labeling and hazard communication program as necessary, and provide additional employee training for newly identified physical or health hazards.	Employers
Transition Period to the effective completion dates noted above	May comply with the March 26, 2012, rule, the old rule, or both.	Chemical manufacturers, importers, distributors, and employers

Because there is a phase-in period, employers can still comply with the older HCS requirements through the dates above.

The HCS requires information to be prepared and transmitted regarding all hazardous chemicals. It covers both physical hazards (such as flammability), and health hazards (such as irritation, lung damage, and cancer).

Compliance Management

Most chemicals used in the workplace have some hazard potential and are covered by the HSC rule (old and new).

Employers that use hazardous chemicals need to have a program in place to ensure the hazard information is provided to exposed employees. “Use” means to package, handle, react, or transfer. This is an intentionally broad scope, and includes any situation where a chemical is present in such a way that employees may be exposed under normal conditions or in an emergency.

If your employees are exposed to chemicals, you will need to develop a written hazard communication program that covers:

- A chemical inventory list;
- Container labels and other forms of warning;
- Collection and availability of safety data sheets (or SDSs, formerly known as material safety data sheets, or MSDSs); and
- Employee information and training.

Here is a checklist that can be helpful when trying to comply with the HCS:

- Obtain a copy of the HCS rule
- Make sure to comply with the HCS 2012 requirements by the specified timeframes
- Read and understand the rule’s requirements as it pertains to employers
- Prepare a written hazard communication program
- Assign responsibilities
- Prepare a chemical inventory
- Ensure that all chemical containers are labeled
- Ensure that there is an SDS for each chemical
- Provide training for all workers with exposure risks
- Review the program routinely (set a review date)

The basis for all “hazard communication” is that the chemical has been evaluated and classified as to its hazards. This responsibility generally falls to the chemical manufacturer or importer. OSHA requires that these parties evaluate and classify each substance using pre-determined “Hazard Classes,” (e.g., “flammable gas,” “corrosive,” etc.) and assign a “Category” to show severity of the hazard. The lower the Category number, the higher the severity within that Class (for example, a Category 1 flammable gas is more flammable than a Category 2). Depending on the Class, there can be up to 5 Categories. As a result of the GHS/Hazcom revisions in 2012, all of this information is standardized, both in the evaluation and classification method, as well as in label elements, SDS elements, and hazard statements. In other words, if a chemical is determined to be a “Category 1 flammable gas” then there is a predefined list

Notes

Vehicle Maintenance Pro

Notes

of pictograms, label elements, SDS wording, etc., that manufacturers or importers must utilize.

Note: Employers are not required to classify chemicals unless they choose not to rely on the classification performed by the chemical manufacturer or importer of the chemical to satisfy this requirement.

The following list identifies some types of potentially hazardous chemicals that may be present in a maintenance facility:

Acids	Glues
Adhesives	Greases
Aerosols	Industrial oils
Asbestos	Janitorial supplies
Battery fluids	Kerosene
Benzene	Lacquers
Catalysts	Lead
Caustics	Oxalic Acid
Cleaning agents	Paints
Coal tar pitch	Plastic resins
Coatings	Resins
Degreasing agents	Sealers
Detergents	Shellacs
Dusts	Solders
Etching agents	Solvents
Fiberglass	Strippers
Flammables	Sufactants
Foaming resins	Thinners
Fuels	Varnishes
Gasoline	Xylene

Compliance Management

All workplaces where employees are exposed to hazardous chemicals are required to have a written plan describing how hazard communication will be carried out in that facility. Plan preparation is not just a paper exercise — all of the elements must be implemented in order to be in compliance with the rule. This is one of the most important aspects of your compliance program. It is also one of the first items that an OSHA compliance officer will examine to determine if your hazard communication program is adequate.

The plan does not have to be lengthy or complicated. It is intended to be a blueprint for implementation of your program — an assurance that all aspects of the requirements have been addressed. It serves to communicate to your employees and to OSHA exactly what you have done to comply with the HCS. In general, the written program must describe how the requirements for labels and other forms of warning, safety data sheets, employee information, and training are going to be met in your facility.

Remember that the written program needs to reflect what you are doing in your workplace. If you use a generic program, it must be adapted to address the facility it covers. For example, the written plan must list the chemicals present at the site, indicate who is to be responsible for the various aspects of the program in your facility, and indicate where written materials will be made available to employees. Your written program must cover the following topics.

The next step is developing an inventory of chemicals. This is the inventory of chemicals for which you must have SDSs. The list may be compiled for the workplace as a whole or for individual work areas. Remember to include any consumer products that you have determined are covered by the standard as well as any substances you may inadvertently produce, such as carbon monoxide. This list must be made available to employees, upon request.

You need only list the chemical name, but OSHA suggests that for your own use, you include all information that will assist in clearly identifying the substance in question, such as chemical name, common or trade name, manufacturer's product name, and CAS number.

Your written program should address the following points regarding labeling:

- Designate the person responsible for ensuring all containers are labeled;
- Designate the person responsible for ensuring all shipped containers are labeled;
- Describe any labeling system used, either on shipped containers or in-plant (include examples of labels used);
- Describe written alternatives to labeling of in-plant containers, if used (for example, putting the label information on stationary tanks);
- Procedures to review and update label information when necessary and to ensure that labels that fall off or become unreadable are immediately replaced;

Notes

Vehicle Maintenance Pro

Notes

- A copy of posters and other written materials used to inform employees about the HCS, or where the information is located.

The label must contain the following elements:

- **Pictogram:** a symbol plus other graphic elements, such as a border, background pattern, or color that is intended to convey specific information about the hazards of a chemical. Each pictogram consists of a different symbol on a white background within a red square frame set on a point (i.e. a red diamond). There are nine pictograms under the GHS. However, only eight pictograms are required under the HCS.
- **Signal words:** a single word used to indicate the relative level of severity of hazard and alert the reader to a potential hazard on the label. The signal words used are “danger” and “warning.” “Danger” is used for the more severe hazards, while “warning” is used for less severe hazards.
- **Hazard Statement:** a statement assigned to a hazard class and category that describes the nature of the hazard(s) of a chemical, including, where appropriate, the degree of hazard.
- **Precautionary Statement:** a phrase that describes recommended measures to be taken to minimize or prevent adverse effects resulting from exposure to a hazardous chemical, or improper storage or handling of a hazardous chemical.
- Name, address, and telephone number of the chemical manufacturer, importer, or other responsible party.

Labels are not intended to be either the sole or the most complete source of information regarding the nature or identity of all hazardous chemicals in the workplace. The chemical identity on the label must be keyed to the chemical’s SDS, which contains more extensive information.

Here are the required pictograms. **Note:** The following illustration is shown in black and white. On actual container labels, each pictogram is required to have a red border/frame.

Compliance Management

	Flame Over Circle • Oxidizers		Flame • Flammables • Self Reactives • Pyrophorics • Self-Heating • Emits Flammable Gas • Organic Peroxides		Exploding Bomb • Explosives • Self Reactives • Organic Peroxides
	Skull and Crossbones • Acute toxicity (severe)		Corrosion • Corrosives		Gas Cylinder • Gases Under Pressure
	Health Hazard • Carcinogen • Respiratory Sensitizer • Reproductive Toxicity • Target Organ Toxicity • Mutagenicity • Aspiration Toxicity		Environment • Environmental Toxicity		Exclamation Mark • Irritant • Dermal Sensitizer • Acute Toxicity (harmful) • Narcotic Effects • Respiratory Tract • Hazardous to Ozone Layer

Notes

The role of an SDS is to provide detailed information on each hazardous chemical, including its potential hazardous effects, its physical and chemical characteristics, and recommendations for appropriate protective measures. This information is useful to you as the employer responsible for designing protective programs, as well as to your employees.

As of June 1, 2015, the HCS will require new SDSs to be in a uniform format, and include the section numbers, the headings, and associated information under the headings below:

Section 1, Identification includes product identifier; manufacturer or distributor name, address, phone number; emergency phone number; recommended use; restrictions on use.

Section 2, Hazard(s) identification includes all hazards regarding the chemical; required label elements.

Section 3, Composition/information on ingredients includes information on chemical ingredients; trade secret claims.

Section 4, First-aid measures includes important symptoms/ effects, acute, delayed; required treatment.

Section 5, Fire-fighting measures lists suitable extinguishing techniques, equipment; chemical hazards from fire.

Section 6, Accidental release measures lists emergency procedures; protective equipment; proper methods of containment and cleanup.

Section 7, Handling and storage lists precautions for safe handling and storage, including incompatibilities.

Section 8, Exposure controls/personal protection lists OSHA's Permissible Exposure Limits (PELs); Threshold Limit Values (TLVs); appropriate engineering controls; personal protective equipment (PPE).

Vehicle Maintenance Pro

Notes

Section 9, Physical and chemical properties lists the chemical's characteristics.

Section 10, Stability and reactivity lists chemical stability and possibility of hazardous reactions.

Section 11, Toxicological information includes routes of exposure; related symptoms, acute and chronic effects; numerical measures of toxicity.

Section 12, Ecological information*

Section 13, Disposal considerations*

Section 14, Transport information*

Section 15, Regulatory information*

Section 16, Other information, includes the date of preparation or last revision.

***Note:** Since other Agencies regulate this information, OSHA will not be enforcing Sections 12 through 15.

You (the employer), as the end user, are entitled to receive an SDS for each chemical product you purchase. If you do not receive one automatically, you should request one. If you receive one that is obviously inadequate, with, for example, blank spaces that are not completed, you will need to request an appropriately completed one. If your request for a data sheet or for a corrected data sheet goes unanswered within a reasonable amount of time (OSHA suggests 30 days), you should contact your local OSHA area office for assistance in obtaining the SDS. If you are still unable to get the data sheet, consider purchasing from another vendor.

Ingredient	CAS No	Percent	Hazardous
Methylene Chloride	75-09-2	40%	Yes
Ethyl Alcohol	64-17-5	30%	Yes
Acetic Acid	64-19-7	15%	Yes
Paraffinic Petroleum Distillates	64742-65-0	15%	Yes

4. First Aid Measures

Inhalation: Remove to fresh air. Get medical attention for any breathing difficulty. If breathing stops, administer artificial respiration.
Ingestion: Do not induce vomiting. Keep individual calm. Obtain medical attention immediately.
Skin Contact: Remove contaminated clothing and shoes. Wash exposed area with soap and water for at least 15 minutes. Get medical advice if irritation develops. Wash contaminated clothing before reuse.
Eye Contact: Flush thoroughly with running water for at least 15 minutes, occasionally lifting the eyelids. Obtain medical attention.

5. Fire Fighting Measures

Fire: Fire is possible if concentrated vapors are exposed to elevated temperatures.
Fire Extinguishing Media: Water spray, dry chemical, alcohol foam, or carbon dioxide.
Special Information: In the event of a fire, wear full protective clothing and NIOSH-approved self-contained breathing apparatus with full facepiece operated in the pressure demand or other positive pressure mode.

6. Accidental Release Measures

Ventilate area of leak or spill. Wear appropriate personal protective equipment as specified in Section 8. Spills: Pick up spill for recovery or disposal and place in a closed container. Keep spilled material away from sewage/drainage systems and waterways.

7. Handling and Storage

Keep in a tightly closed container, stored in a cool, dry, ventilated area. Protect against physical damage. Isolate from incompatible substances. Observe all warnings and precautions listed for the product.

8. Exposure Controls/Personal Protection

Airborne Exposure Limits:
- OSHA Permissible Exposure Limit (PEL):
methylene chloride = 5000 ppm (TWA);
ethyl alcohol = 1000 ppm;
acetic acid = none established;
paraffinic petroleum distillates = 400 ppm.
- ACGIH Threshold Limit Value (TLV):
methylene chloride = 50 ppm (TWA);
ethyl alcohol = 1000 ppm;
acetic acid = none established;
paraffinic petroleum distillates = 400 ppm.

Ventilation System:
Sufficient to maintain vapor concentration below TLV. Do not use in a closed or confined space.

Personal Respirators (NIOSH Approved):
If the exposure limit is exceeded, wear an appropriate NIOSH N95 respirator, full-facepiece respirator, or airlined hood.

Skin Protection:
Wear impervious protective clothing, including gloves and apron, to prevent skin contact.

Eye Protection:
Use chemical safety goggles or full face shield when splashing is a concern. Maintain eye-wash fountain and quick-drench facility in the work area.

Other Control Measures:
Protective equipment for laboratory bench use should be chosen using professional judgment based on the size and type of reaction.

Notice: Chemical and other data represented in this safety data sheet image is for example purposes only.

Notes

Vehicle Maintenance Pro

Notes

9. Physical and Chemical Properties

Appearance:
Clear, yellowish liquid.
Odor:
Sweet, aromatic odor.
Solubility:
1.4 grams per 100 grams at 77°F
Specific Gravity:
1.2 at 77°F
pH:
No information found.
% Volatiles by volume @ 21°C (70°F):
Not available
Boiling Point:
No information found.

Melting Point:
199°C (390°F) Decomposes.
Freezing Point:
-96.7°C (-142.1°F)
Flash Point:
16°C (61°F)
Flammability:
Non-flammable liquid. Vapor will burn at high temperatures.
Vapor Density (Air=1):
No information found.
Vapor Pressure (mm Hg):
No information found.
Evaporation Rate (BuAc=1):
No information found.

10. Stability and Reactivity

Stability:
Stable under ordinary conditions of use and storage.
Hazardous Decomposition Products:
Burning may produce carbon monoxide, carbon dioxide, nitrogen oxides.

Hazardous Polymerization:
Will not occur.
Incompatibilities:
Strong oxidizers and reactive metals.
Conditions to Avoid:
Incompatibles and hot surfaces which can cause thermal decomposition.

11. Toxicological Information

Methylene chloride: oral rat LD50: 16000mg/kg; inhalation rat LC50: 52gm/m3; investigated as a tumorigen, mutagen, reproductive effector.
Ethyl alcohol: oral rat LD50= 7060mg/kg; inhalation rat LC50= 20,000ppm/10H; investigated as a tumorigen, mutagen, reproductive effector.
Acetic acid: No LD50/LC50 information found relating to normal routes of occupational exposure.
Paraffinic petroleum distillates: Not known.

12. Ecological Information

Environmental Fate:
When released into the soil, this material may biodegrade to a moderate extent. When released into the soil, this material is expected to leach into groundwater. When released into water, this material may biodegrade to a moderate extent. When released into the air, this material may be moderately degraded by reaction with photochemically produced hydroxyl radicals. When released into air, this material is expected to have a half-life between 10 and 30 days.

Ecotoxicological Data:
96 hr. NOEL (minnow) 110 mg/L
24 hr EC50 (Daphnia Magna) 460 mg/L

13. Disposal Considerations

Recover or recycle if possible. It is the responsibility of the waste generator to determine the proper waste classification and disposal methods in compliance with applicable federal, state, and local regulations. Do not dispose of in the environment, in drains or water courses. Drain container thoroughly. Send to recycler/reclaimer.

14. Transport Information

Transport in accordance with all federal, state, and local regulations.
UN number 2929
UN proper shipping name Toxic liquid, flammable, n.o.s.
Hazards class 6.1; Packing Group III

15. Regulatory Information

-----\Chemical Inventory Status - Part I\-----

16. Other Information

NFPA Ratings: Health: 3 Flammability: 1 Reactivity: 0
HMIS Ratings: Health: 3 Flammability: 1 Physical Hazard: 0
This SDS was prepared by U. R. Chemical.

Revision Information: Revised 05/27/12

Notice: Chemical and other data represented in this safety data sheet image is for example purposes only.

Compliance Management

SDSs must be readily accessible to employees when they are in their work areas. This can be accomplished in many different ways. You will need to decide what is the best media and storage method for your particular workplace.

For example, SDSs can be paper, electronic data, faxed materials, CD ROM, or available from SDS services. You can even use SDSs that are available on the internet. Because there is no mandatory media that must be used, data sheets are available in a wide variety of formats.

OSHA also does not have a specific requirement for storing SDSs. They can be stored in a binders (or binders) at specific locations or on your computer network. You can choose the best method for your company. Remember, when choosing a format or a storage method, the SDS must be readily available to all employees no matter what shift they work.

Training is critical to effective hazard communication. It is the forum in which hazard information can best be presented. Under the Hazard Communication Standard, all covered facilities are required to establish an effective training and information program for every employee routinely exposed to hazardous chemicals.

Prior to the initial job assignment, each employee who has exposure risks to hazardous chemicals must be provided information and training. Scheduled required training is not required under the regulation. However, additional training has to be done whenever a chemical with new physical or health hazards is introduced into the work area.

There are no specific instructor requirements. you simply need to make sure that whoever does the chemical-specific training thoroughly understands the safe handling aspects of the chemicals being covered. If you have several people, such as supervisors, conducting training for their work areas, sit in on a session or two to observe how the training is being handled.

The key term used in the regulations as far as training is concerned is “understanding.” Not only do employees have to be trained, but they must walk away from that training understanding what they are working with. Giving an employee a data sheet to read does not satisfy the intent of the HCS. The training should include an opportunity for them to ask questions, thus ensuring that they understand the information.

One of the questions that is routinely asked in this area is, “What if we use one of the other labeling systems in-house?” While the Hazcom 2012 rule requires shipped containers to conform to the GHS-style labeling system, OSHA still allows employers to use their own workplace labeling systems (for example, HMIS®III and NFPA) for in-house usage. If an employer does choose to continue using an alternative labeling system, the employer must ensure that the system is updated as necessary so that it does not conflict with GHS-style labeling/classification.

Employers who use general, nonspecific in-plant labeling systems such as HMIS or NFPA must ensure through their hazard communication program that their employees can correlate the visual warning on the in-plant container with the applicable chemical and its appropriate hazard warnings.

Notes

Vehicle Maintenance Pro

Notes

The other marking and labeling system used by industry, the DOT system is also addressed in the HCS rules. Packages holding hazardous materials are required to be marked and labeled according to the DOT hazardous materials regulations (HMR) while being transported. These containers must retain the labels until the hazardous materials are removed. This requirement comes from §1910.1201, Retention of DOT Markings, Placards, and Labels, an OSHA rule related to the HCS.

The rule requires employers who receive hazardous materials to retain markings and any other information specified by HMR until the materials have been removed so they no longer pose a health or safety risk. It applies primarily to bulk packages (defined by the DOT as containers with a capacity of more than 119 gallons), but also applies to non-bulk receptacles that are repackaged and reshipped.

The HCS requires that labels, tags, and markings be attached in a way that does not conflict with the HMR. Consequently, the HCS warning labels, tags, or markings do not appear on the outer packagings of combination packagings (*e.g.* bottles in a box). The inner packagings are required to be labeled according to HCS guidelines, while the outside packaging is marked or labeled according to HMR guidelines. Without restricting the regulation to bulk packaging, employers would be faced with confusing, redundant, and sometimes inconsistent labeling requirements between DOT and OSHA.

This requirement applies only to the employer that receives the hazardous materials — not the person responsible for transporting it. The transported is subject to only the DOT HMR requirements.

Typical OSHA compliance issues

If you find yourself responsible for OSHA compliance in your company, and don't quite know where to turn, it's not a surprise. The regulations of this agency are voluminous and complex — far too complex to cover in any complete fashion here. Basically, the bulk of regs you have to be concerned about are found in 29 CFR, Part 1910. (See the listing of the table of contents of this Part in the Compliance Section to get an idea of the subjects covered.

The following list of topics are also likely to be found in your maintenance area, or related parts of the company you work for. The topic includes the 1910 subpart where those regulations can be found:

- Floors, walkways, and stairs (Subpart D, 1910.21-1910.30).
- Confined spaces (Subpart J, 1910.146).
- Personal protective equipment (Subpart I, 1910.132-1910.138).

Compliance Management

Specialized work areas

Servicing large tires and rims

OSHA has a standard requiring the training of all technicians on the servicing of multi-piece and single piece rim wheels used on large vehicles such as trucks, tractors, trailers, buses and off-road machines. These regulations also specify the equipment that must be used, and the condition it must be in. See §1910.177 for full details.

You have to provide a program to train all employees who service these rim/wheels/tires on the hazards involved in servicing them and the safety procedures to be followed. The information provided to the technicians and used in the training program has to include, at a minimum, the information contained in the OSHA's charts and rim manuals.

OSHA requires that the materials (poster and/or manuals) be available in the immediate area where the work takes place for reference. While OSHA provides these materials in §1910.177, materials provided by others (such as tire and rim manufacturers, and J. J. Keller & Associates, Inc.) is acceptable, as long as it includes the required information.

As well as training the technicians, you have to make sure that each technician that works on these tires and rims demonstrates and maintains the ability to do the work safely. This includes being able to perform the following tasks safely and in accordance with the regulations, when working on multi-piece and single piece rims, wheels, and tires:

- Dismounting of tires (including deflation);
- Inspection and identification of the rim, tire, and wheel components;
- Mounting of tires (including inflation with a restraining device or other safeguards, such as using proper fluids);
- Use of the restraining device or barrier, and other equipment required to safely inflate the tires (such as a locking chuck);
- Handling of rims, wheels, and tires;
- Inflation of the tire when mounted on a vehicle;
- An understanding of the necessity of standing outside the trajectory area both during inflation of the tire and during inspection of the rim wheel following inflation; and
- Installation and removal of rims, wheels, and tires.

You need to actually evaluate each technician's ability to perform these tasks safely, and shall provide additional training as necessary to assure that each employee maintains his or her proficiency.

While some people have taken these regulations to mean that they cannot service multi-piece rims in their facilities, this is not the case. The regulations simply mean that the shop must have the proper safety equipment, and the technicians involved in this work must be full trained and equipped to do it. However, there is no regulation saying that you **MUST** work on multiple-piece rims. You can always refuse to service such rims. Due to the risks involved, many shops have done just that.

Notes

Vehicle Maintenance Pro

Notes

Following you will find illustrations of several kinds of work areas which are likely to be present in a maintenance shop, plus references to the corresponding standards and marking requirements OSHA has for each of these areas. See the sections immediately following on:

- Welding areas.
- Spray paint booths or areas.
- Maintenance shop work areas.
- Vehicle maintenance area.

Welding situation

Almost every facility has the need to do some kind of welding. The welding process presents some of the greatest hazards to both safety and health. Therefore, OSHA has some recent, very stringent regulations spelled out to protect worker safety. These regulations include certain marking requirements.

The term “welding” is used broadly to include gas welding, electric-arc welding, resistance welding, soldering, and brazing. You might have a single portable welding unit to do the occasional spot welding task, or you might have large electric welders used in daily production tasks. You may have a separate welding room or rooms, or you may have one corner of a larger area designated as your welding area.

Whatever the physical dimensions of your welding operation, you must comply with certain marking requirements. The illustrations show some typical markings. Read the text for even more requirements.

Compliance Management

Notes

Fire Extinguisher .157(c)(1) and .252(a)(2)(ii). The employer shall provide portable fire extinguishers and shall mount, locate and identify them so that they are readily accessible to employees without subjecting the employees to possible injury.

Suitable fire extinguishing equipment shall be maintained in a state of readiness for instant use. Such equipment may consist of pails of water, buckets of sand, hose or portable extinguishers depending upon the nature and quantity of the combustible material exposed.

EXIT .35 and .37(b). Lighting and marking must be adequate and appropriate. Each exit route must be adequately lighted so that an

Vehicle Maintenance Pro

Reserved

Compliance Management

employee with normal vision can see along the exit route. Each exit must be clearly visible and marked by a sign reading “Exit.”

Each exit route door must be free of decorations or signs that obscure the visibility of the exit route door. If the direction of travel to the exit or exit discharge is not immediately apparent, signs must be posted along the exit access indicating the direction of travel to the nearest exit and exit discharge. Additionally, the line-of-sight to an exit sign must clearly be visible at all times. Each doorway or passage along an exit access that could be mistaken for an exit must be marked “Not an Exit” or similar designation, or be identified by a sign indicating its actual use (e.g., closet).

Each exit sign must be illuminated to a surface value of at least five foot-candles (54 lux) by a reliable light source and be distinctive in color. Self-luminous or electroluminescent signs that have a minimum luminance surface value of at least .06 footlamberts (0.21 cd/m²) are permitted. Each exit sign must have the word “Exit” in plainly legible letters not less than six inches (15.2 cm) high, with the principal strokes of the letters in the word “Exit” not less than three-fourths of an inch (1.9 cm) wide.

An employer who demonstrates compliance with the exit route provisions of the National Fire Protection Association’s publication NFPA 101-2000, Life Safety Code, will be deemed to be in compliance with the corresponding requirements in §§1910.34, 1910.36, and 1910.37.

HOT METAL .252(b)(4)(vii). After welding operations are completed, the welder shall mark the hot metal or provide some other means of warning other workers.

CAUTION: WELDING FUMES .1200(f)(5), (I) and (ii). Under Hazard Communication, the employer must ensure that every container of hazardous chemicals in the workplace, where there is the potential of exposure, is labeled, tagged, or marked. In this case, the room is the container, the welding fumes are the hazardous chemical, and workers are being exposed to the fumes.

Except as provided in paragraphs (f)(6) and (f)(7) of this section, the employer shall ensure that each container of hazardous chemicals in the workplace is labeled, tagged or marked with the following information:

- Identity of the hazardous chemical(s) contained therein; and,
- Appropriate hazard warnings, or alternatively, words, pictures, symbols, or combination thereof, which provide at least general information regarding the hazards of the chemicals, and which, in conjunction with the other information immediately available to employees under the hazard communication program, will provide employees with the specific information regarding the physical and health hazards of the hazardous chemical.

NO SMOKING .106(e)(6)(I). Adequate precautions shall be taken to prevent the ignition of flammable vapors. Sources of ignition include but are not limited to open flames; lightning; smoking; cutting and welding; hot surfaces; frictional heat; static, electrical, and mechanical sparks;

Notes

Vehicle Maintenance Pro

Notes

spontaneous ignition, including heat-producing chemical reactions; and radiant heat.

EAR AND EYE PROTECTION REQUIRED .145 and .252(b)(3). Employees exposed to the hazards created by welding, cutting, or brazing operations shall be protected by personal protective equipment in accordance with the requirements of §1910.132. Appropriate protective clothing required for any welding operation will vary with the size, nature, and location of the work to be performed. If the employer determines that the nature of the hazard is such that failure to designate it may lead to an accidental injury, then a sign in accordance with §1910.145 or other effective means like proper training is required. Otherwise, it is optional.

USE NO OIL .253(e)(6)(iii). Gages on oxygen regulators shall be marked "USE NO OIL."

Oxygen/Acetylene Barrier .253(b)(4)(iii). Acetylene is highly flammable, and the presence of oxygen dramatically increases the hazards. Therefore, oxygen cylinders in storage shall be separated from fuel-gas cylinders or combustible materials (especially oil or grease), a minimum distance of 20 feet or by a noncombustible barrier at least five feet high having a fire-resistance rating of at least one-half hour.

Cylinders and Containers .253(b)(1)(I) and (ii). All portable cylinders used for the storage and shipment of compressed gases shall be constructed and maintained in accordance with the regulations of the U.S. Department of Transportation, 49 CFR parts 171-179.

Compressed gas cylinders shall be legibly marked, for the purpose of identifying the gas content, with either the chemical or the trade name of the gas. Such marking shall be by means of stenciling, stamping, or labeling, and shall not be readily removable. Whenever practical, the marking shall be located on the shoulder of the cylinder.

This method conforms to the American National Standard Method for Marking Portable Compressed Gas Containers to Identify the Material Contained, ANSI Z48.1-1954, which is incorporated by reference as specified in §1910.6.

Compliance Management

Notes

CAUTION: Welding may produce fumes and gases hazardous to health, etc. .252(c)(1)(iv) and (A)

A number of potentially hazardous materials are employed in fluxes, coatings, coverings, and filler metals used in welding and cutting or are released to the atmosphere during welding and cutting.

The suppliers of welding materials shall determine the hazard, if any, associated with the use of their materials in welding, cutting etc. All filler metals and fusible granular materials shall carry the following notice, as a minimum, on tags, boxes, or other containers:

Vehicle Maintenance Pro

Notes

CAUTION. Welding may produce fumes and gases hazardous to health. Avoid breathing these fumes and gases. Use adequate ventilation. See ANSI Z49.1-1967. Safety in Welding and Cutting published by the American Welding Society.

CAUTION: CONTAINS FLUORIDES .252(c)(1)(iv)(c). Brazing and gas welding fluxes containing fluorine compounds shall have a cautionary wording to indicate that they contain fluorine compounds. One cautionary wording recommended by the American Welding Society for brazing and gas welding fluxes reads as follows:

CAUTION

CONTAINS FLUORIDES

This flux when heated gives off fumes that may irritate eyes, nose, and throat.

1. Avoid fumes-use only in well-ventilated spaces.
2. Avoid contact of flux with eyes or skin.
3. Do not take internally.

CAUTION: WELDING FUMES .1200(f)(5). Under Hazard Communication, the employer must ensure that every container of hazardous chemicals in the workplace, where there is the potential of exposure, is labeled, tagged, or marked. In this case, the room is the container, the welding fumes are the hazardous chemical, and workers are being exposed to the fumes.

Warning Labels on packages on shelves .1200(f). Under Hazard Communication, the employer must ensure that every container of hazardous chemicals in the workplace is labeled, tagged, or marked with the chemical name and the hazard warning.

OTHER WELDING MARKINGS, NOT PICTURED

WARNING: CONTAINS CADMIUM .252(c)(1)(iv)(b). Brazing (welding) filler metals containing cadmium in significant amounts shall carry the following notice on tags, boxes, or other containers:

WARNING

CONTAINS CADMIUM-POISONOUS

FUMES MAY BE FORMED ON HEATING

Do not breathe fumes. Use only with adequate ventilation such as fume collectors, exhaust ventilators, or air-supplied respirators. See ANSI Z49.1-1967.

If chest pain, cough, or fever develops after use, call physician immediately.

Manifolding of Cylinders .253(c)(3)(v). The following sign shall be conspicuously posted at each low-pressure oxygen manifold (for use with cylinders having a Department of Transportation service pressure not exceeding 200 psig):

LOW-PRESSURE MANIFOLD

Compliance Management

DO NOT CONNECT HIGH-PRESSURE CYLINDERS

MAXIMUM PRESSURE-250 psig (1.7MPa)

Service Piping Systems .253(d)(4)(ii) and (iii). Aboveground piping systems shall be marked in accordance with the American National Standard Scheme for the Identification of Piping Systems, ANSI A13.1-1956. Station outlets shall be marked to indicate the name of the gas.

Acetylene Generators .253(f)(1). Generators shall be plainly marked with:

1. The maximum rate of acetylene in cubic feet per hour for which they are designed.
2. The weight and size of carbide necessary for a single charge.
3. The manufacturer's name and address.
4. The name or number of the type of generator.

Calcium Carbide Storage .253(g)(1)(ii). Packages containing calcium carbide shall be conspicuously marked "CALCIUM CARBIDE -DANGEROUS IF NOT KEPT DRY" or with equivalent warning.

Spray paint booth or area

Most spray painting materials are flammable so areas where spray painting is done can present particular safety hazards. OSHA defines a "spraying area" as any area in which dangerous quantities of flammable vapors or mists, or combustible residues, dusts, or deposits are present due to the operation of spraying processes.

You might have a more enclosed structure where your painting is done. This would be a "spray booth," a power-ventilated structure provided to enclose or accommodate a spraying operation to confine and limit the escape of spray, vapor, and residue, and to safely conduct or direct them to an exhaust system.

Notes

Vehicle Maintenance Pro

Notes

Fire Extinguisher .107(f)(4), .157(a), (c)(1), (d)(1), and (e)(2) - (4). An adequate supply of suitable portable fire extinguishers must be installed near all spraying areas. You must mount, locate, and identify them so that they are readily accessible to employees.

When portable fire extinguishers are provided for employee use, they must be selected and distributed based on the classes of anticipated workplace fires and on the size and degree of the hazard which would affect their use. You will notice that many fire extinguishers will indicate the fire classes they are capable of extinguishing; however, these markings are not required.

Instruction labels for using the fire extinguisher are often times provided by the extinguisher manufacturer, but are not required.

Although not required by OSHA, many employers choose to tag their extinguisher to indicate what type of extinguishing agent it contains, what the full weight is, when it was inspected, who performed the inspection, and the annual maintenance check result (the extinguisher was serviced, recharged, or new). This documents the required monthly visual inspection.

Also, many employers who must comply with hydrostatic testing and maintenance procedures, choose to label their extinguishers with the date of the last hydrostatic test, though not required.

Emergency Eyewash .151(c) and ANSI Z358.1-1998 (informational marking). Suitable facilities for quick drenching or flushing of the eyes and body must be provided in the work area for emergency use if workers' eyes or bodies are exposed to injurious corrosive materials. While not required by OSHA, ANSI Z358.1-1998, American National Standard for

Compliance Management

Emergency Eyewash and Shower Equipment, recommends that companies use signs to identify eyewash locations.

Right to Know/Material Safety Data Sheets (MSDSs) .1200(g)(10). Material safety data sheets must be readily accessible to employees. A right to know or MSDS station containing MSDSs does not need to be posted in the workplace; however, it is a convenient way to keep them accessible to employees in the work area in the event of an emergency.

Hazard Communication Labels On Containers .1200(f)(5). The employer must ensure that every container of hazardous chemicals in the workplace is labeled, tagged, or marked with the chemical name and an appropriate hazard warning. It is an acceptable format to use the red, blue, orange, and white label, as long as specific information on the chemical's hazards and toxic organ effects is given during training. The label depicted in the graphic is the Hazardous Materials Identification System III developed by the National Paint & Coatings Association. We have left the ratings blank; however, the ratings would be entered on the label in an actual situation.

Marked Pressure Gage .94(c)(7)(iii). Clean fresh air, free of contamination from adjacent industrial exhaust systems, chimneys, stacks, or vents, must be supplied to a spray booth or room in quantities equal to the volume of air exhausted through the spray booth.

Where the air supply to a spray booth or room is filtered, the fan static pressure must be calculated on the assumption that the filters are dirty to the extent that they require cleaning or replacement. The rating of filters must be governed by test data supplied by the manufacturer of the filter. A pressure gage must be installed to show the pressure drop across the filters. This gage must be marked to show the pressure drop at which the filters require cleaning or replacement. Filters must be replaced or cleaned whenever the pressure drop across them becomes excessive or whenever the air flow through the face of the booth falls below that specified in Table G-10 in §1910.94.

Warning: Use Only Non-Sparking Tools .107(g)(2) and (m)(2). All spraying areas shall be kept as free from the accumulation of deposits of combustible residues as practical, with cleaning conducted daily if necessary. Scrapers, spuds, or other such tools used for cleaning purposes shall be of non-sparking material. Only non-sparking tools must be used in any area where organic peroxides are stored, mixed, or applied.

Caution: Keep door closed when spray painting (informational marking). While this sign is not required by OSHA, it will encourage employees to keep the door closed while spray painting. Therefore, vapors will be less likely to enter the areas outside the paint booth and the ventilation system can work efficiently to remove paint vapors from within the paint booth.

Inspection Record for Automatic Sprinkler System .159(c)(2) and (3). Although not required by OSHA, many employers and sprinkler inspectors choose to tag automatic sprinkler systems to indicate inspection tests and dates. This documents the required inspections such as the annual main drain flow test, the opening of the test valve every two

Notes

Vehicle Maintenance Pro

Notes

years, and the acceptance tests; state and local required tests; and the tests recommended by NFPA 25-1998, Inspection, Testing and Maintenance of Water-Based Fire Protection Systems, and other NFPA standards.

The employer must properly maintain an automatic sprinkler system installed to comply with OSHA regulations. The employer must assure that a main drain flow test is performed on each system annually. The inspector's test valve must be opened at least every two years to assure that the sprinkler system operates properly.

The employer must conduct proper acceptance tests on sprinkler systems installed for employee protection after January 1, 1981, and record the dates of such tests. Proper acceptance tests include:

- Flushing of underground connections,
- Hydrostatic tests of piping in system,
- Air tests in dry-pipe systems,
- Dry-pipe valve operation, and
- Test of drainage facilities.

No Smoking .107(g)(7), (l)(4)(iii), and (m)(2). "No Smoking" signs in large letters on contrasting color background shall be conspicuously posted at all spraying areas and paint storage rooms.

This requirement produces many citations each year.

"No Smoking" signs in large letters on contrasting color background must be conspicuously posted at all powder-coating areas and powder storage rooms as well.

Smoking must be prohibited and "No Smoking" signs must be prominently displayed and only non-sparking tools must be used in any area where organic peroxides are stored, mixed or applied.

Warning: Carbon Dioxide .160(b)(5). If you have a fixed extinguishing system for fire protection, the employer shall post hazard warning or caution signs at the entrance to, and inside of, areas protected by fixed extinguishing systems which use agents in concentrations known to be hazardous to employees safety and health.

Red Oily Waste Can .107(g)(3) and .144(a)(1)(ii). Residue scrapings and debris contaminated with residue must be immediately removed from the premises and properly disposed of. Approved metal waste cans must be provided wherever rags or waste are impregnated with finishing material and all such rags or waste deposited therein immediately after use. OSHA does not require oily waste cans to be red. This is simply a popular practice.

On a somewhat related note, safety cans or other portable containers of flammable liquids having a flash point at or below 80 degrees Fahrenheit, table containers of flammable liquids (open cup tester), excluding shipping containers, must be painted red with some additional clearly visible identification either in the form of a yellow band around the can

Compliance Management

or the name of the contents conspicuously stenciled or painted on the can in yellow.

Oily Waste Can Empty Every Night .107(g)(3) (informational marking). The contents of waste cans, containing rags or waste impregnated with finishing material, must be properly disposed of at least once daily or at the end of each shift.

Markings Not Shown

Safe Distance Sign .107(h)(6). A safe distance must be maintained between goods being painted and electrodes or electrostatic atomizing heads or conductors of at least twice the sparking distance. A suitable sign indicating this safe distance must be conspicuously posted near the assembly.

Maintain Ventilation Warning Sign .107(j)(4)(v). Automobile refinishing spray booths or enclosures, otherwise installed and maintained in full conformity with §1910.107, may alternately be used for drying with portable electrical infrared drying apparatus when, among other things, the drying apparatus contains a prominently located, permanently attached warning sign indicating that ventilation should be maintained during the drying period and that spraying should not be conducted in the vicinity that spray will deposit on apparatus.

Grounding Warning .107(i)(6) and (l)(7)(iii). All electrically conductive objects in the electrostatic hand-spraying area must be adequately grounded. This requirement applies to paint containers, wash cans, and any other objects or devices in the area. The equipment must carry a prominent permanently installed warning regarding the necessity for this grounding feature.

For powder-coating operations, all electrically conductive objects within the charging influence of the electrodes must be adequately grounded. The powder-coating equipment must carry a prominent, permanently installed warning regarding the necessity for grounding these objects.

Maintenance shop

Another typical scene in most facilities is the maintenance shop. Here you may do major or minor repairs, and general maintenance. You might have some chemicals — gasoline, solvents, cleaning supplies. You might have some electrical devices — drills, saws, meters. There are any number of hazards that could exist in this environment.

These are some of the marking requirements you may have to comply with.

Notes

Vehicle Maintenance Pro

Notes

Flammable: Keep Fire Away .106(d)(3)(ii). Storage cabinets in which you keep flammable liquids, such as gasoline, must be labeled in conspicuous lettering, “FLAMMABLE - KEEP FIRE AWAY.”

Gasoline Can Markings .144(a)(1)(ii). Safety cans or other portable containers of flammable liquids that have a flash point at or below 80° F, table containers of flammable liquids (open cup tester), excluding shipping containers, have to be painted red with some additional, clearly visible identification either in the form of a yellow band around the can

Compliance Management

or the name of the contents clearly stenciled or painted on the can in yellow.

Danger High Voltage Marking (informational marking). While a HIGH VOLTAGE marking is not required for cabinets, boxes, and fittings other than pull and junction boxes for systems over 600 volts, nominal under §1910.305(b)(3)(iii), you may wish to mark other cabinets, boxes, and fittings over 600 volts, nominal, with the HIGH VOLTAGE marking. We marked the panel in our graphic with a DANGER HIGH VOLTAGE marking for informational purposes.

Lockout/Tagout .147(c)(2), (5)(ii), and (iii). If an energy isolating device is not capable of being locked out, then you may use a tagout system. The tagout devices must warn against hazardous conditions if the machine or equipment is energized and shall include a legend such as the following: DO NOT START, DO NOT OPEN, DO NOT CLOSE, DO NOT ENERGIZE, DO NOT OPERATE. This includes vehicles that are being worked on!

Lockout and tagout devices used throughout your facility must be standardized in at least one of the following criteria: color, shape, or size and print and format. This aids employee recognition.

Tagout devices, including their means of attachment, shall be substantial enough to prevent inadvertent or accidental removal. Tagout device attachment means shall be of a non-reusable type, attachable by hand, self-locking, and non-releasable with a minimum unlocking strength of no less than 50 pounds and having the general design and basic characteristics of being at least equivalent to a one-piece, all-environment-tolerant nylon cable tie.

Fire Extinguisher .106(d)(7) and .157(c)(1). Suitable fire control devices must be available at locations where flammable and combustible liquids are stored. At least one portable fire extinguisher having at least a 12-B units rating must be located outside of, but not more than 10 feet from, the door opening into any room used for storage. At least one portable fire extinguisher having at least a 12-B units rating must be located not less than 10 feet, nor more than 25 feet, from any Class I or Class II liquid storage area located outside of a storage room but inside a building.

If you are using portable fire extinguishers, you must mount, locate, and identify them so that they are readily accessible to employees.

Danger: No Smoking .106(d)(7)(iii) and (e)(6). Open flames and smoking shall not be permitted in flammable or combustible liquid storage areas.

Adequate precautions shall be taken to prevent the ignition of flammable vapors. Smoking is prohibited, except in designated localities. “No Smoking” signs must be conspicuously posted where hazards from flammable liquid vapors is normally present. Sources of ignition include but are not limited to open flames, lightning, and smoking.

Hazard Communication Labels .1200(f)(5). Employers must ensure that every container of hazardous chemicals in the workplace is labeled, tagged, or marked with the chemical name and an appropriate hazardwarning. If the containers already have labels on them when they

Notes

Vehicle Maintenance Pro

Notes

arrive in your facility, you are not required to relabel them as long as the label has the chemical name and the appropriate hazard warnings. If you decide to relabel, an acceptable format to use is the red/blue/yellow/white label, as long as specific information on the chemical's hazards are given during training.

Right to Know/Material Safety Data Sheet Station .1200(g)(10). Material safety data sheets (MSDSs) must be readily accessible to employees. A Right to Know or MSDS station containing MSDSs does not need to be posted in the workplace; however, it is a convenient way to keep MSDSs accessible to employees in the work area in the event of an emergency.

Hazardous Waste Marking 40 CFR 262.32 and 49 CFR 172.304. Before transporting hazardous waste off-site, a generator must mark each container of 119 gallons or less with the following words and information in accordance with the requirements of 49 CFR 172.304:

HAZARDOUS WASTE - Federal Law Prohibits Improper Disposal. If found, contact the nearest police or public safety authority or the U.S. Environmental Protection Agency.

Generator's Name and Address _____ .

Generator's EPA Identification Number _____ .

Manifest Tracking Number _____ .

Red Waste Container .1030(d)(4) and (g)(1). Contaminated sharps and regulated waste must be placed in properly-labeled containers. Warning labels must be affixed to containers of regulated waste containing blood or other potentially-infectious material.

First Aid Supplies .151(b) (informational marking). First aid supplies shall be readily available.

Eye Protection Required §1910.133(a), .145(c)(2), and .252(b)(3). Employees must use appropriate eye or face protection when exposed to eye or face hazards from flying particles. Caution signs can be posted to indicate a possible hazard against which proper precautions should be taken. If the employer determines that the nature of the hazard is such that failure to designate it may lead to an accidental injury, then a sign in accordance with §1910.145 or other effective means, like proper training, is required. Otherwise, it is optional.

Employees exposed to the hazards created by welding, cutting, or brazing operations shall be protected by personal protective equipment in accordance with the requirements of §1910.132 of this part. Appropriate protective clothing required for any welding operation will vary with the size, nature, and location of the work to be performed.

Respiratory Protection .134(a). Respirators must be provided by the employer when such equipment is necessary to protect the health of the employee. Respiratory protection must be provided for air contaminated with harmful dust, fog, fumes, mist, gas, smoke, spray, or vapor.

Compliance Management

If the employer determines that the nature of the hazard is such that failure to designate it may lead to an accidental injury, then a sign in accordance with §1910.145 or other effective means, like proper training, is required. Otherwise, it is optional.

Radial Saws .213(h)(5). Ripping and ploughing must be against the direction in which the saw turns. The direction of the saw rotation must be conspicuously marked on the hood. In addition, a permanent label not less than 1½ by ¾ inch shall be affixed to the rear of the guard at approximately the level of the arbor, reading as follows: “Danger: Do Not Rip or Plough From This End.”

Markings Not Shown

Hearing Protection Required (informational marking). Whenever an employee is exposed to sound levels exceeding the levels prescribed by OSHA, the employer must ensure that hearing protection is worn. This informational marking serves to remind employees that hearing protection may need to be worn when power tools are operated.

Portable Containers of Flammable Liquid .144(a)(1)(ii). Safety cans or other portable containers of flammable liquids that have a flash point at or below 80° F, table containers of flammable liquids (open cup tester), excluding shipping containers, have to be painted red with some additional, clearly visible identification either in the form of a yellow band around the can or the name of the contents clearly stenciled or painted on the can in yellow.

Respirator certification .134(d)(1)(ii), (3)(iv), and (j). Select a NIOSH-certified respirator. For protection against particulates that create atmospheres that are not immediately dangerous to life or health, you may provide:

- An atmosphere-supplying respirator;
- An air-purifying respirator equipped with a filter certified by NIOSH under 30 CFR 11 as a high efficiency particulate air (HEPA) filter, or an air-purifying respirator equipped with a filter certified for particulates by NIOSH under 42 CFR 84; or
- For contaminants consisting primarily of particles with mass median aerodynamic diameters (MMAD) of at least 2 micrometers, an air-purifying respirator equipped with any filter certified for particulates by NIOSH.

Ensure that all filters, cartridges and canisters used in the workplace are labeled and color coded with the NIOSH approval label and that the label is not removed and remains legible.

Vehicle maintenance area

Many companies repair and maintain their own fleet of vehicles and have facilities on-site to accomplish this. There are a variety of signs and labels required in a vehicle maintenance area, regardless of whether the fleets being maintained are 5 cars or 175 trucks. The markings will vary depending upon the tasks performed in the maintenance area. The illustrations show some typical situations that may be found at any facility.

Notes

Vehicle Maintenance Pro

Notes

Vehicle Maintenance — Mezzanine

Caution: Eye And Ear Protection Required .145(c)(2). Caution signs can be posted to indicate a possible hazard against which proper precautions should be taken. If the employer determines that the nature of the hazard is such that failure to designate it may lead to an accidental injury, then a sign in accordance with §1910.145 or other effective means, like proper training, is required. Otherwise, it is optional.

ACME COMPANY .133(a)(4). Eye and face personal protective equipment must be distinctly marked to facilitate identification of the manufacturer. **DISCLAIMER:** ACME, ACME, Inc., or ACME Company

Compliance Management

as used in this workplace situation is a fictional creation and has no relationship to any business or organization, past or present. Any similarity in the name or the situations presented is purely coincidental.

Carbon Monoxide Wall Placard (informational marking). Under the hazard communication standard, every workplace exposure that an employee experiences is the responsibility of the employer. The worker has the right to know what he is being exposed to. If you have motors running in the vehicle maintenance area, it is more than likely that you have carbon monoxide fumes. Hazard communication training is required for employees that have carbon monoxide in their work area. In addition, you may post a sign to raise awareness regarding this exposure.

Exit .35 and .37(b). Lighting and marking must be adequate and appropriate. Each exit route must be adequately lighted so that an employee with normal vision can see along the exit route.

Each exit must be clearly visible and marked by a sign reading "Exit." Each exit route door must be free of decorations or signs that obscure the visibility of the exit route door. If the direction of travel to the exit or exit discharge is not immediately apparent, signs must be posted along the exit access indicating the direction of travel to the nearest exit and exit discharge. Additionally, the line-of-sight to an exit sign must clearly be visible at all times. Each doorway or passage along an exit access that could be mistaken for an exit must be marked "Not an Exit" or similar designation, or be identified by a sign indicating its actual use (e.g., closet).

Each exit sign must be illuminated to a surface value of at least five foot-candles (54 lux) by a reliable light source and be distinctive in color. Self-luminous or electroluminescent signs that have a minimum luminance surface value of at least .06 footlamberts (0.21 cd/m²) are permitted. Each exit sign must have the word "Exit" in plainly legible letters not less than six inches (15.2 cm) high, with the principal strokes of the letters in the word "Exit" not less than three-fourths of an inch (1.9 cm) wide.

An employer who demonstrates compliance with the exit route provisions of the National Fire Protection Association's publication NFPA 101-2000, Life Safety Code, will be deemed to be in compliance with the corresponding requirements in §§1910.34, 1910.36, and 1910.37.

Floor Marking .22(b)(1) and (2). Permanent aisles and passageways in the workplace must be appropriately marked. Where mechanical handling equipment is used, sufficient safe clearances shall be allowed for aisles, at loading docks, through doorways, and wherever turns or passage must be made. Aisles and passageways shall be kept clear and in good repair, with no obstruction across or in the aisles that could create a hazard.

Right To Know/Material Safety Data Sheet Station .1200(g)(10) (informational marking). Material safety data sheets (MSDSs) must be readily accessible to employees. A right to know or MSDS station containing MSDS sheets does not need to be posted in the workplace;

Notes

Vehicle Maintenance Pro

Notes

however, it is a convenient way to keep MSDS sheets accessible to employees in the work area in the event of an emergency.

Load Rating Plate .22(d)(1). In every building or structure used for mercantile, business, industrial, or storage purposes, the loads approved by the building official shall be marked on plates of approved design and shall be affixed by the owner of the building, or his authorized agent, in a conspicuous place in each space to which they relate. The plates should not be removed or defaced. If lost, removed, or defaced, they should be replaced by the owner or his agent.

It is unlawful to place a load on a floor, roof, or other structure greater than that for which the floor or roof of a building or other structure was approved by the building official.

MAX 6600 RPM .215(d)(1) and .243(c)(5). The spindle speed of the machine must be checked before mounting of the wheel to be certain that it does not exceed the maximum operating speed marked on the wheel.

DANGER Defective Equipment .177(e)(2). Multi-piece wheel components and single piece wheels must be inspected prior to assembly. Any wheel or wheel component which is bent out of shape, pitted from corrosion, broken, or cracked must not be used and must be marked or tagged unserviceable and removed from the service area. Damaged or leaky valves must be replaced.

Compliance Management

Vehicle Maintenance Compressed Gases Area

Cylinders and Containers .253(b)(1). Compressed gas cylinders must be legibly marked, for the purpose of identifying the gas content, with either the chemical or the trade name of the gas.

Such marking shall be by means of stenciling, stamping, or labeling, and shall not be readily removable. Whenever practical, the marking shall be located on the shoulder of the cylinder.

This method conforms to the American National Standard Method for Marking Portable Compressed Gas Containers to Identify the Material Contained, ANSI Z48.1-1954. Use No Oil §1910.253(e)(6) Gages on oxygen regulators shall be marked "USE NO OIL."

Notes

Vehicle Maintenance Pro

Notes

No Smoking .106(e)(6). Adequate precautions shall be taken to prevent the ignition of flammable vapors. Sources of ignition include, but are not limited to, open flames, lightning, smoking, and cutting and welding.

Caution: Eye Protection Required .145(c)(2) and .242(b). Compressed air may only be used for cleaning purposes when the pressure is reduced to less than 30 p.s.i. and then only when effective chip guarding and personal protective equipment is used.

Caution signs can be posted to indicate a possible hazard against which proper precautions should be taken. If the employer determines that the nature of the hazard is such that failure to designate it may lead to an accidental injury, then a sign in accordance with §1910.145 or other effective means, like proper training, is required. Otherwise, it is optional.

Fire Hose .158(c)(1). Where reels or cabinets are provided to contain fire hoses, the employer must be sure that they are conspicuously identified and used only for fire equipment.

5 TONS .244(a)(1). The operator must make sure that the jack used has a rating sufficient to lift and sustain the load. The rated load must be legibly and permanently marked in a prominent location on the jack by casting, stamping, or other suitable means.

NOTICE Out Of Order .244(a)(2)(viii). Jacks which are out of order must be tagged accordingly, and must not be used until repairs are made.

Vehicle Maintenance — Dip Tank & Used Oil

Many of the materials shown and discussed in this section are also covered in the EPA Compliance Management section of this manual. This section is looking strictly at the OSHA aspects of having these materials in your shop.

Compliance Management

Notes

Emergency Telephone Numbers .151(a). OSHA medical and first aid requirements provide that employers must ensure the ready availability of medical personnel for advice and consultation on health matters. While there is no specific requirement to post emergency telephone numbers, it is certainly a good idea to make this information available to employees in the event of an emergency to ensure that medical personnel are readily available when needed.

OSHA No. 300-A Form .32. An annual summary of occupational injuries and illnesses for each establishment must be posted by employers. The summary must be presented on the OSHA No. 300-A form (or equivalent according to §1904.32(b)(2)(iii)) and must contain information regarding the calendar year covered, the company name, the name and address of the establishment, average number of employees covered by the OSHA 300 Log, the total hours worked by all employees covered by

Vehicle Maintenance Pro

Notes

the OSHA 300 Log, a company executive's signature certifying the accuracy of the information, the executive's title and phone number, and the date. The summary for the previous calendar year is to be posted no later than February 1 and must remain posted until April 30.

Carbon Monoxide Wall Placard (informational marking). Under the hazard communication standard, every workplace exposure that an employee experiences is the responsibility of the employer. The worker has the right to know what he is being exposed to. If you have motors running in the vehicle maintenance area, it is more than likely that you have carbon monoxide fumes. Hazard communication training is required for employees that have carbon monoxide in their work area. In addition, you may post a sign to raise awareness regarding this exposure.

Hazard Communication Labels On Containers .1200(f)(5). The employer must ensure that every container of hazardous chemicals in the workplace is labeled, tagged, or marked with the chemical name and an appropriate hazard warning. In this illustration, portable containers that are often found throughout a vehicle maintenance facility are shown with labels, along with the parts-cleaner unit which contains a chemical solvent. The red, blue, yellow label shown on the portable bottles and the parts cleaner are an acceptable labeling format to use in-house to comply with the hazard communication standard, as long as specific information on the chemical's hazards are given during training.

Exit .35 and .37(b). Lighting and marking must be adequate and appropriate. Each exit route must be adequately lighted so that an employee with normal vision can see along the exit route. Each exit must be clearly visible and marked by a sign reading "Exit."

Each exit route door must be free of decorations or signs that obscure the visibility of the exit route door. If the direction of travel to the exit or exit discharge is not immediately apparent, signs must be posted along the exit access indicating the direction of travel to the nearest exit and exit discharge. Additionally, the line-of-sight to an exit sign must clearly be visible at all times. Each doorway or passage along an exit access that could be mistaken for an exit must be marked "Not an Exit" or similar designation, or be identified by a sign indicating its actual use (e.g., closet).

Each exit sign must be illuminated to a surface value of at least five foot-candles (54 lux) by a reliable light source and be distinctive in color. Self-luminous or electroluminescent signs that have a minimum luminance surface value of at least .06 footlamberts (0.21 cd/m²) are permitted. Each exit sign must have the word "Exit" in plainly legible letters not less than six inches (15.2 cm) high, with the principal strokes of the letters in the word "Exit" not less than three-fourths of an inch (1.9 cm) wide.

An employer who demonstrates compliance with the exit route provisions of the National Fire Protection Association's publication NFPA 101-2000, Life Safety Code, will be deemed to be in compliance with the corresponding requirements in §§1910.34, 1910.36, and 1910.37.

Compliance Management

Fire Extinguisher .157(c)(1). When portable fire extinguishers are provided for employee use, they must be selected and distributed based on the classes of anticipated workplace fires and on the size and degree of the hazard which would affect their use. You will notice that many fire extinguishers will indicate the fire classes they are capable of extinguishing; however, this is not required.

If you are using portable fire extinguishers, you must mount, locate, and identify them so that they are readily accessible to employees.

Instruction labels for using the fire extinguisher are often times provided by the extinguisher manufacturer, but are not required according to OSHA. However, if your employees are designated to use portable fire extinguishers, you must train them in the use of the appropriate equipment. For portable fire extinguishers this training must be given upon initial employment and at least annually thereafter.

Portable fire extinguishers must be visually inspected monthly. They must also have a maintenance check annually. Although not required by OSHA, many employers choose to tag their extinguisher to indicate what type of extinguishing agent it contains, what the full weight is, when it was inspected, who performed the inspection, and the annual maintenance check result (the extinguisher was serviced, recharged, or new).

In addition to an external visual examination, you must ensure that an internal examination of cylinders and shells to be tested is made prior to hydrostatic tests. Stored pressure extinguishers do not require an internal examination.

You must assure that portable extinguishers are hydrostatically tested at the intervals as required.

Used Oil Label 40 CFR 279.22(c). Containers and aboveground tanks used to store used oil at generator facilities must be labeled or marked clearly with the words, "Used Oil." Fill pipes used to transfer used oil into underground storage tanks at generator facilities must be labeled or marked clearly with the words, "Used Oil."

Drained Used Oil Filters Label (possible state requirement). There is no federal requirement for labeling properly gravity hot-drained oil filters, drained according to 40 CFR 261.4(b)(13). However, if the filters are not properly drained then the filters are not exempt and fall under 40 CFR 279 and must be labeled with the words, "Used Oil."

Some states may have more stringent rules which require your company to label properly gravity hot-drained oil filters. In California, for example, containers of these filters must be marked with the words "Drained Used Oil Filters" along with the initial date of accumulation.

New and Used Battery Storage Posting (informational marking). Batteries can pose many hazards, especially when stored in unventilated areas. While not a requirement, it is a good idea for companies to post safety signs stating that the hydrogen gas given off by batteries may be explosive in addition to the hazards of acid burns and lead exposures.

Universal Waste - Battery(ies) 40 CFR 273.14. Universal waste batteries (i.e., each battery), or a container in which the batteries are

Notes

Vehicle Maintenance Pro

Notes

contained, must be labeled or marked clearly with any one of the following phrases: "Universal Waste-Battery(ies)," or "Waste Battery(ies)," or "Used Battery(ies)."

Markings Not Shown

Hot Metal §1910.252(b)(4)(vii). After welding operations are completed, the welder shall mark the hot metal or provide some other means of warning other workers.

Caution: Welding May Produce Fumes And Gases Hazardous to Health, etc. .252(c)(1)(iv)(A). A number of potentially hazardous materials are employed in fluxes, coatings, coverings, and filler metals used in welding and cutting or are released to the atmosphere during welding and cutting.

The suppliers of welding materials shall determine the hazard, if any, associated with the use of their materials in welding, cutting, etc. All filler metals and fusible granular materials shall carry the following notice, as a minimum, on tags, boxes, or other containers:

CAUTION: Welding may produce fumes and gases hazardous to health. Avoid breathing these fumes and gases. Use adequate ventilation. See ANSI Z49.1-1967.

Caution: Welding Fumes May Be Present .1200(f)(5). Under the hazard communication standard, the employer must ensure that every container of hazardous chemicals in the workplace, where there is the potential of exposure, is labeled, tagged, or marked. In this case, the room would be the container and the welding fumes would be the hazardous chemical to which employees are exposed. This situation is similar to the situation discussed above where labeling would be required for any carbon monoxide fumes that may be present in the area.

Personal Protective Equipment Required (Welding Area) .252(b)(3) and (Battery Handling Area) .132. Employees exposed to the hazards created by welding, cutting, or brazing operations shall be protected by personal protective equipment in accordance with the requirements of §1910.132. Appropriate protective clothing required for any welding operation will vary with the size, nature, and location of the work to be performed.

Employees who handle batteries may be exposed to battery acids. For this reason, they must be protected by personal protective equipment in accordance with the requirements of §1910.132. Appropriate protective clothing should include gloves, eye and face protection, foot protection, and an apron. Signs may be used to reinforce this requirement.

Eyewash Station §1910.151(c) and ANSI Z358.1-1998. Where the eyes or body of any person may be exposed to injurious corrosive materials (like battery acid), suitable facilities for quick drenching or flushing of the eyes and body shall be provided within the work area for immediate emergency use. Signs marking the location of the eyewash station are helpful in emergencies. While not required by OSHA, ANSI Z358.1-1998, American National Standard for Emergency Eyewash and Shower Equipment, recommends signs be used to identify eyewash locations.

Compliance Management

Remember, this is only a sampling of the diverse topics that OSHA regulates in the workplace.

Hazardous waste operations and emergency response (HAZWOPER)

This OSHA regulation, found in 29 CFR 1910.120, may affect your company. Following is a brief explanation of this complex regulation.

Hazardous waste is a serious safety and health problem that continues to endanger human and animal life and environmental quality. Hazardous waste — discarded chemicals that are toxic, flammable, or corrosive (see EPA Compliance section) — can cause fires, explosions, and pollution of air, water, and land. Unless hazardous waste is properly treated, stored, or disposed of, it will continue to do great harm to all living things that come into contact with it now or in the future.

Because of the seriousness of the safety and health hazards related to hazardous waste operations, the Occupational Safety and Health Administration (OSHA) has issued a standard specifically developed to protect workers in this environment and to help them handle hazardous wastes safely and effectively. This regulation can be found at 29 CFR 1910.120.

The standard covers workers employed in cleanup operations at uncontrolled hazardous waste sites and at EPA-licensed waste treatment, storage and disposal (TSD) facilities; as well as workers responding to emergencies involving hazardous materials (e.g., spills).

State, county, and municipal employees such as police, ambulance workers, and firefighters with local fire departments, will be covered by the regulations issued by the 25 states operating their own OSHA-approved safety and health programs. EPA regulations will cover these employees in states without state plans. These regulations will be based on OSHA's standard.

An effective and comprehensive safety and health program is essential in reducing work-related injuries and illnesses and in maintaining a safe and healthy work environment. The standard, therefore, requires each employer to develop and implement a written safety and health program that identifies, evaluates, and controls safety and health hazards and provides emergency response procedures for each hazardous waste site or treatment, storage, and disposal facility.

This written program must include specific and detailed information on the following topics:

- An organizational workplan.
- Site evaluation and control.
- A site-specific program.
- Information and training program.
- Personal protective equipment program.
- Monitoring.

Notes

Vehicle Maintenance Pro

Notes

- Medical surveillance program.
- Decontamination procedures.
- Emergency response program.

The written safety and health program must be periodically updated and made available to all affected employees, contractors, and subcontractors. The employer also must inform contractors and subcontractors, or their representatives, of any identifiable safety and health hazards or potential fire or explosion hazards before they enter the work site.

Surviving an OSHA inspection

Workplace inspections are performed by OSHA compliance officers who are knowledgeable and experienced in the occupational safety and health field and who are trained in OSHA standards and in the recognition of safety and health hazards. Similarly, states with their own occupational safety and health programs conduct inspections using qualified state compliance safety and health officers.

Following on the next pages is some information on how an OSHA inspection is carried out, inspection priorities used by the agency, and a description of the inspection process.

Inspections are usually conducted without advance notice. In fact, alerting an employer without proper authorization in advance of an OSHA inspection can bring a fine of up to \$1,000 and/or a six-month jail term. This is true for OSHA compliance officers as well as state inspectors.

There are, however, special circumstances under which OSHA may give notice to the employer, but such a notice will normally be less than 24 hours. These circumstances include:

- Imminent danger situations which require correction as soon as possible.
- Inspections which must take place after regular business hours or which require special preparation.
- Cases where notice is required to assure that the employer and employee representative or other personnel will be present.
- Cases where an inspection must be delayed for more than 5 working days when there is good cause.
- Situations in which the OSHA area director determines that advance notice would produce a more thorough or effective inspection.

Employers who receive advance notice of an inspection must inform their employees' representative or arrange for OSHA to do so.

If an employer refuses to admit an OSHA compliance officer or if an employer attempts to interfere with the inspection, the Act permits appropriate legal action.

Compliance Management

Based on a 1978 Supreme Court ruling (*Marshall v. Barlow's Inc.*), OSHA usually may not conduct warrantless inspections without valid consent. They may, however, inspect after acquiring a judicially-authorized search warrant based upon administrative probable cause or upon evidence of a violation.

The remainder of this section is divided into five parts: inspection priorities; preparing for the inspection; the inspection; the inspection process; inspection results; and appeals process.

Inspection priorities

Obviously, not all workplaces covered by the Act can be inspected immediately. The worst situations need attention first. Therefore, OSHA has established a system of inspection priorities.

Imminent danger

Imminent-danger situations are given top priority. An imminent danger is any condition where there is reasonable certainty that a danger exists that can be expected to cause death or serious physical harm immediately or before the danger can be eliminated through normal enforcement procedures.

Serious physical harm is any type of harm that could cause permanent or prolonged damage to the body or which, while not damaging the body on a prolonged basis, could cause such temporary disability as to require in-patient hospital treatment. OSHA considers that "permanent or prolonged damage" has occurred when, for example, a part of the body is crushed or severed; an arm, leg, or finger is amputated; or sight in one or both eyes is lost.

This kind of damage also includes that which renders a part of the body either functionally useless or substantially reduced in efficiency on or off the job. An example: bones in a limb shattered so severely that mobility or dexterity will be permanently reduced.

Temporary disability requiring in-patient hospital treatment includes injuries such as simple fractures, concussions, burns, or wounds involving substantial loss of blood and requiring extensive suturing or other healing aids.

Injuries or illnesses that are difficult to observe are classified as serious if they inhibit a person in performing normal functions, cause reduction in physical or mental efficiency, or shorten life.

Health hazards may constitute imminent-danger situations when they present a serious and immediate threat to life or health.

For a health hazard to be considered an imminent danger, there must be a reasonable expectation (1) that toxic substances such as dangerous fumes, dusts or gases are present, and (2) that exposure to them will cause immediate and irreversible harm to such a degree as to shorten life or cause reduction in physical or mental efficiency, even though the resulting harm is not immediately apparent.

Notes

Vehicle Maintenance Pro

Notes

Employees should inform the supervisor or employer immediately if they detect or even suspect an imminent-danger situation in the workplace. If the employer takes no action to eliminate the danger, an employee or the authorized employee representative may notify the nearest OSHA office and request an inspection.

The request should identify the workplace location, detail the hazard or condition and include the employee's name, address and telephone number. Although the employer has the right to see a copy of the complaint if an inspection results, the name of the employee will be withheld if the employee so requests.

The OSHA area director reviews the information and immediately determines whether there is a reasonable basis for the allegation. If it is decided the case has merit, the area director will alert the OSHA regional administrator and the regional solicitor, and assign a compliance officer to conduct an immediate inspection of the workplace.

Upon inspection, if an imminent-danger situation is found, the compliance officer will ask the employer to voluntarily abate the hazard and to remove endangered employees from exposure. Should the employer fail to do this, OSHA, through the regional solicitor, may apply to the nearest Federal District Court for appropriate legal action to correct the situation.

Before the OSHA inspector leaves the workplace, he or she will advise all affected employees of the hazard. Should OSHA "arbitrarily or capriciously" decline to bring court action, the affected employees may sue the Secretary of Labor to compel the Secretary to do so. Such action can produce a temporary restraining order (immediate shutdown) of the operation or section of the workplace where the imminent danger exists.

Walking off the job because of potentially unsafe workplace conditions is not ordinarily an employee right. To do so may result in disciplinary action by the employer. However, an employee does have the right to refuse (in good faith) to be exposed to an imminent danger. OSHA rules protect employees from discrimination if:

- Where possible, he or she asked the employer to eliminate the danger, and the employer failed to do so; and
- The danger is so imminent that there is not sufficient time to have the danger eliminated through normal enforcement procedures; and
- The danger facing the employee is so grave that "a reasonable person" in the same situation would conclude there is a real danger of death or serious physical harm; and
- The employee has no reasonable alternative to refusing to work under these conditions.

If an imminent-danger situation is found, the compliance officer will ask the employer to voluntarily abate the hazard and to remove endangered employees from exposure. Should the employer fail to do this, OSHA, through the regional solicitor, may apply to the Federal District Court for an injunction prohibiting further work as long as unsafe conditions exist.

Compliance Management

Fatality or multiple hospitalization incidents

Second priority is given to investigation of fatalities and incidents resulting in hospitalization of three or more employees.

Such catastrophes must be orally reported by phone or in person to OSHA by the employer within 8 hours. OSHA investigates to determine the cause of such accidents, whether existing OSHA standards were violated, and whether additional standards are necessary to help avoid a recurrence of similar accidents.

Employee complaints

Third priority is given to formal employee complaints of alleged violations of standards or of unsafe or unhealthful working conditions.

The Act gives each employee the right to request an OSHA inspection when the employee feels he or she is in imminent danger from a hazard or when he or she feels that there is a violation of an OSHA standard that threatens physical harm.

OSHA will maintain confidentiality if requested, will inform the employee of any action it takes regarding the complaint, and if requested, will hold an informal review of any decision not to inspect.

Programmed inspections

Next in priority are programmed inspections aimed at specific high-hazard industries, occupations or health substances, or other industries identified in OSHA's current inspection procedures. Industries are selected for inspection on the basis of such factors as the injury incidence rates, previous citation history, employee exposure to toxic substances, or random selection. Special-emphasis programs may also be developed and may be regional or national in scope, depending on the distribution of the workplaces involved. Comprehensive safety inspections in manufacturing will be conducted normally in those establishments with lost-workday injury rates at or above the BLS national rate for manufacturing currently in use by OSHA. States with their own occupational safety and health programs may use somewhat different systems to identify industries for inspection.

Follow-up inspections

A follow-up inspection determines if previously -cited violations have been corrected. If an employer has failed to abate a violation, the compliance officer informs the employer that he/she is subject to "Failure to Abate" alleged violations and proposed additional daily penalties while such failure to abate or violation continues.

Records review

A records review is an examination of the employer's injury and illness records to determine whether there will be a comprehensive inspection of the workplace. The compliance officer reviews the OSHA 300 Log of

Notes

Vehicle Maintenance Pro

Notes

occupational injuries and illnesses and employment data of the establishment. Using these data, the compliance officer calculates the DART (days away from work, restricted work, or job transfer) and DAFWII (days away from work injury and illness) rates for the establishment. These figures are compared to the national average for the industry segment, which are published by the Bureau of Labor Statistics (BLS). If the calculated DART and DAFWII rates are below the BLS rates, the compliance officer will not normally conduct a comprehensive safety inspection. However, if the rates are above the national average, an inspection will be conducted.

The inspection process

After the opening conference, the compliance officer and accompanying representatives proceed through the establishment to inspect work areas for safety or health hazards.

The route and duration of the inspection are determined by the compliance officer. While talking with employees, the compliance officer makes every effort to minimize work interruptions. The compliance officer observes safety and health conditions and practices, consults with employees, takes photos and instrument readings, examines records, collects air samples, measures noise levels, surveys existing engineering controls, and monitors exposure to toxic fumes, gases, and dust.

Trade secrets observed by the compliance officer will be kept confidential. An inspector who releases confidential information without authorization is subject to a \$1,000 fine and/or one year in jail. The employer may require that the employee representative have a confidential clearance for any area in question.

Employees are consulted during the inspection tour. The compliance officer may stop and question workers, in private, about safety and health conditions and practices in their own work-places. Each employee is protected, under the Act, from discrimination for exercising his or her safety and health rights.

OSHA places special importance on posting and recordkeeping. The compliance officer will inspect records of deaths, injuries and illnesses which the employer is required to keep. He or she will check to see that the OSHA 300A Summary has been posted and that the OSHA workplace poster (OSHA 2203 or 3165) is prominently displayed. Where records of employee exposure to toxic substances and harmful physical agents have been required, they are also examined for compliance with the recordkeeping requirements.

The compliance officer also explains that while the following items are not required for all OSHA standards they should be recorded to accurately monitor and assess occupational hazards.

- **Initial and periodic monitoring**, including the data of measurement, for operations involving exposure; sampling and analytical methods used and evidence of their accuracy; number, duration, and results of samples taken; type of respiratory protective devices worn; and name, social security number, and the results of all

Compliance Management

employee exposure measurements. This record should be kept for 30 years.

- **Employee physical/medical examinations**, including the name and social security number of the employee; physician's written opinions; any employee medical complaints related to exposure to toxic substances; and information provided to the examining physician. These records should be maintained for the duration of employment plus 30 years.
- **Employee Training.** These records should be kept for one year beyond the last date of employment of that employee.

The compliance officer also explains the requirements of the Hazard Communication Standard. Under that rule, manufacturing employers must establish a written, comprehensive hazard communication program which includes provisions for container labeling, material safety data sheets, and an employee training program. The program must contain a list of the hazardous chemicals in each work area and the means the employer will use to inform employees of the hazards non-routine tasks.

During the course of the inspection the compliance officer will point out to the employer any unsafe or unhealthful working conditions observed. At the same time, the compliance officer will discuss possible corrective action if the employer so desires.

Some apparent violations detected by the compliance officer can be corrected immediately. When they are corrected on the spot, the compliance officer records such corrections to help in judging the employer's good faith in compliance. Even though corrected, however, the apparent violations may still serve as the basis for a citation and, if appropriate, a notice of proposed penalty.

An inspection tour may cover part or all of an establishment, even if the inspection resulted from a specific complaint, fatality, or catastrophe.

Closing conference

After the inspection tour, a closing conference is held between the compliance officer, the employer, and the employer representative. It is a time for free discussion of problems and needs; a time for frank questions and answers.

The compliance officer also will give the employer a copy of "Employer Rights and Responsibilities Following an OSHA Inspection," and then briefly discuss the information in the booklet and answer any questions.

The compliance officer discusses with the employer all unsafe or unhealthful conditions observed on the inspection and indicates all apparent violations for which a citation may be issued or recommended. The employer is also informed of appeal rights. The compliance officer will not indicate any specific proposed penalties. Only the OSHA area director has that authority.

During the closing conference, the employer may wish to produce records to show compliance efforts and to provide information which can help

Notes

Vehicle Maintenance Pro

Notes

OSHA determine how much time may be needed to abate an alleged violation.

When appropriate, more than one closing conference may be held. This is usually necessary when health hazards are being evaluated or when laboratory reports are required.

If the employee representative did not participate in the opening conference held with the employer, a closing discussion is held with the employee representative, if requested, to discuss matters of direct interest to employees.

The compliance officer explains that OSHA area officers are full-service resource centers that inform the public of OSHA activities and programs, comment periods, or public hearings; provide technical experts and materials, including courses offered at the OSHA Training Institute; refer callers to other agencies and professional organizations as appropriate; and promote effective safety and health programs through voluntary protection programs and expanded employer abatement assistance efforts.

Inspection results

After the compliance officer reports the findings, the area director determines if citations will be issued and if penalties will be proposed.

Citations

Citations inform the employer and employees of the regulations and standards alleged to have been violated and the length of time set for their abatement. The employer will receive citations and notices of proposed penalties by certified mail. The employer must post a copy of each citation at or near the place the violation occurred, for three days or until the violation is abated, whichever is longer.

Follow-up inspection and failure to abate

If you receive a citation, a follow-up inspection may be conducted to verify that you have:

- Posted the citation as required;
- Corrected the violations as required in the citation; and/or
- Adequately protected employees during multi-step or lengthy abatement periods.

In addition to providing for penalties for failure-to-post citations and failure-to-abate violations, the Act clearly states that you have a continuing responsibility to comply with the Act and assure your employees of safe and healthful working conditions. Any new violations discovered during a follow-up inspection will be cited.

To achieve abatement by the date set forth in the citation, it is important that abatement efforts be promptly initiated.

Compliance Management

Employer discrimination

The Act prohibits employers from discharging or otherwise discriminating against an employee who has exercised any right under this law, including the right to make safety and health complaints or to request as OSHA inspection. Complaints from employees who believe that they have been discriminated against will be investigated by OSHA. If the investigation discloses probable violations of employee rights, court action may follow.

Organize for safety

After you have analyzed the shop's layout for the best vehicle traffic patterns and orderly workflow, lightened, brightened, and aired the interior, put all equipment in its place, and properly posted hazards, you can look at how safely the staff operates. If you've decided that procedures need to be tightened up and you'd like to set some standards, there is nothing controversial about setting safety standards and enforcing them. By doing this you are demonstrating the fleet's interest in its employees' health and welfare on the job, and assuring compliance with the OSHA regulations. It is an excellent way to start bringing the concept of standards into the shop, and to build cooperation and trust in your staff.

The safety standard

Just like the other maintenance standards, the fleet's safety policy should be in writing. Action needs to be taken to enforce those standards. The Maintenance Pro is responsible on both counts — setting the policy and enforcing it. Before you begin to write safety standards for your shop you must believe that such a program will benefit both the fleet and its employees. You must also be convinced that:

- Preventing injuries is good business.
- All injuries are preventable.
- Management is responsible for preventing injuries.
- Employees have the right to a safe working environment.
- Employees can be trained to work safely.
- A safety program will not work without the cooperation of employees.

The safety inspection

Safety professionals refer to the inspection as a safety audit. It means going around the shop while work is in progress and identifying safety hazards. A safety inspection must be conducted frequently, because even if a shop has been designed with safety in mind, it doesn't automatically stay that way! To begin a regular inspection procedure, you may decide to:

- Hire an outside consultant. The professional will do a thorough job and create a checklist for your shop that can be used for future

Notes

Vehicle Maintenance Pro

Notes

inspections; hiring an outside professional may give credibility to the project and take you off the hook for being the bad guy.

- Conduct the inspection yourself. You should develop, then, a written checklist and consult some safety references and literature for help in creating that list (don't forget DOT, EPA and OSHA regulations — they can be a starting point).
- Appoint a "safety committee" of employees. This can be a way to get technicians involved and ensure better cooperation later when the standards are put into practice. You can also ask for volunteers, but make sure you know and they know that fleet management will be behind them 100%. All suggestions may not be followed, but all will be heard.

Any safety inspection should concentrate on four areas, says a specialist who has developed guidelines which can be applied to the trucking industry too:

- storage and use of hazardous and flammable materials,
- electrical equipment,
- personal protective equipment, and
- housekeeping.

Let's look at each of these areas individually:

Flammable substances such as paints, solvents, gasoline, etc. must be handled with great care. These kinds of materials must be stored in sturdy cabinets with doors. Only the materials needed for each working day (or better, for each job) should be removed from the cabinets, and containers must be returned.

If such products are in bulk storage, be sure that employees know how to draw off and transfer them according to prescribed methods. Solvent drums should be grounded to prevent static electricity buildup; all storage containers should be kept tightly sealed except during transfer. Only approved safety cans should be used for transfer.

Electrical equipment multiplies quickly in a shop, so if you're starting from scratch, plan the location of all electrically-operated equipment at the beginning. Determine phasing of each machine; make sure that capacity won't be less than demand. Be sure that there are enough outlets and add extra ones rather than using three-in-one connectors and other make-do solutions.

Electrical hand power tools should be inspected regularly for wear and/or damage. Some things to keep in mind for tools and equipment:

- Tools or extension cords with frayed, cracked, or missing insulation should not be used. Protect cords from oil, heat, and cutting; if damaged, cords should be replaced, not patched.
- Switches, outlets, or junction boxes should be covered. Don't permit any do-it-yourself wiring. Bare wires, broken fixtures, outlets, etc. must be reported right away.

Compliance Management

- All power tools must have a ground connection (separate groundwire or three-pronged plug); don't use an ungrounded adapter.
- Sparks from power tools can ignite vapors from open containers of flammable materials and spray booths. Spray areas should have explosion-proof lights, and circuits must not be overloaded. Equipment that is not equipped with explosion-proof motors must be used at least 20 feet away from spray areas.

Personal protective equipment is often annoying to employees, and it does take time to find and put on a pair of goggles. The potential for injury in a maintenance shop is great and every employee from helper to first-class technician should be aware that taking proper precautions is part of being a professional:

- Tools and heavy parts are hazards to feet; safety shoes with metal toe inserts and non-slip soles should be worn by all shop employees.
- There are special gloves for almost every job in the shop: welding gloves, rubber gloves for handling caustics, acids, batteries, and solvents, and gloves for handling glass or jagged metal should all be provided for the personnel. Make sure that they have a place and are used for every special job.
- Eye and face protection devices also vary according to the job. Special tinted goggles for gas welding, brazing, etc. and helmets with special lenses for all welding are examples. Goggles, face shields, or prescription industrial-safety glasses (does your shop pay for these? It is a nice perk) must be used in any work area where grinding, sanding, drilling, etc. is going on or where glare, radiation, or splashes of harmful liquids are hazards. A technician working under a vehicle where pieces may fall into the eyes is another situation that should require the use of safety glasses or goggles. Specialized tasks may also require eye protection. Eye and face protection is very important when working on air conditioners, for example.
- Respiratory protection when sanding or grinding is necessary. The filter mask should fit well around nose and mouth. Filters should be checked frequently. Air-supply respirators or approved organic vapor (charcoal) cartridge respirators should be worn whenever the employee is mixing or applying painting materials (product labels will indicate which type of respiratory protection is recommended and/or required). Be sure that each employee's respirator fits correctly.
- Harmful noise levels over a period of time can cause hearing loss. Ear plugs are inexpensive and easy to use; headset-type devices are more costly, but they provide superior protection. Cutting, sanding or drilling metal, using air impacts, hammering, and running engines are all situations where hearing protection should be required.
- The specific maintenance tasks in the shop should be checked for hazards; for example, truck air conditioning, cooling system, battery work, etc. have hazardous liquids; any time a technician works

Notes

Vehicle Maintenance Pro

Notes

under a vehicle, whether on a hoist or over a pit, there is potential danger. Every shop employee should be on the lookout for unsafe acts. There are also specific rules for tire and rim work. Multipiece tire rims have been known to fly apart during inflation or deflation. Accidents happen with single-piece rims too. The shop must have standard procedures for working with safety cages. Displaying posters which illustrate procedures can remind employees of the correct way to do things.

If you have decided that the standard should be written by a safety committee, the committee members should establish the safe and correct way to conduct shop inspections and service procedures. Safety is also important in the use of hand tools. Some simple rules:

- use the right tool
- use the tool properly
- maintain the tool regularly, and
- use approved eye protection.

The screwdriver, for example, is one of the most misused tools. Like not matching the tip with the screw. Or using a hammer on the screwdriver. Or holding the work in one hand while using a screwdriver with the other. Tips need watching. A hand file should be used to recondition the blade, not a bench grinder (replacement blades are available as well!). Are hammers used improperly? Are technicians encouraged to purchase special tools (or will the shop purchase them) if they are safer to use?

Good housekeeping is actually the first step in a safety program. Train your people to put things away. Equipment goes back in its proper place; junk gets disposed of immediately. The jagged edges of metal can cause damage; insist that technicians use gloves when bringing rusty metal pieces to the trash (and make sure that their tetanus shots are up to date). First-aid kits and emergency telephone numbers should be available in several locations.

Aisles and walkways must be kept free of tools, creepers, electrical wires, hoses, etc. to prevent tripping accidents. These additional important areas should also be kept clear of obstructions: fire exits, fire extinguishers, electrical fixtures/switches, heating equipment, and any stored hazardous materials.

Did you spill? Did it leak? Clean it up. Immediately. Grease, oil, water, and other liquids are not only a hazard, but a mess besides. Make sure that personnel clean up after themselves. technicians should not only wipe up the floor, but also clean up any part of the vehicle that they are working on. It doesn't take that much extra effort and the engine compartment of the truck will stay cleaner and easier to inspect, for example.

Those greasy shop towels and rags belong in a covered metal container away from any heat and should be disposed of daily. Changes of clothing should also be on hand (and while we're at it, insist that personnel be dressed neatly; torn clothing and hanging buttons create a work hazard). A shower in the technician's washroom is a practical safety measure. The

Compliance Management

sink there should be a janitorial model so technicians can scrub to the shoulders.

Floors should be swept and washed daily. A shop vac is ideal so that dust and debris aren't blown into the air. technicians should ensure that their bays are cleaned up after each job. Storage areas should always look neat and organized. Have specified locations for equipment, painting outlines on the floor if necessary. Racks and shelves should be strong; check that things are stacked safely, not too high, not too heavy, not hanging over. Obviously heavy items belong on the lower shelves. Be sure that transfer equipment is available to move heavy items and to spare employees' backs. Consider a portable shop crane to move heavy parts around.

It's important that your safety standards be part of every employee's daily routine. They are also part of every employee's job orientation and should be reviewed regularly. Posting safety signs can be a useful reminder, but change them frequently when employees no longer see them. Periodic safety campaigns that concentrate on one particular work procedure or habit are a good way to review the standards methodically. You and any other supervisory staff set the tone for enforcement. No Smoking signs mean just that — for everyone.

Fire prevention and hazardous materials training should also be conducted frequently and regularly. Make sure that everyone knows about the different kinds of fires and firefighting equipment. Similarly, training should be conducted on the kinds of hazardous substances present in the shop and how they are to be disposed of safely.

Equipment and tools (and personal protective devices like respirators, asbestos gloves, etc.) should be regularly inspected and repaired or replaced. Protective guards should also be on all machines where required.

OSHA Training

The first decisions you must make are what topics you want to train on and how to accomplish the training. Some topics, such as shop safety, machine safety, emergency procedures, tire mounting and dismounting, forklift operation, and hazardous materials (hazard communications) are required. Other topics you will want to train on to reduce the odds of injury in your facility (slips and falls as an example). Most OSHA training standards are performance-oriented, specifying the results but not mandating the methods to be used. Therefore, you can set up the type of training program that fits best into your operation.

There are a number of different approaches that can be taken. You could use videos, interactive computer programs, classroom instruction, or a combination of methods. The best attack is to set up training which allows employees an opportunity to ask questions to ensure that they understand the information presented to them.

WARNING: Giving an employee a sheet of paper to read does not satisfy the intent of the standards.

The next decision to make is who will do the training. OSHA allows you to select the instructors. However, it is up to you to make sure they are

Notes

Vehicle Maintenance Pro

Notes

qualified (knowledgeable) in the area they are instructing. Let's look at selecting an instructor for conducting hazardous materials training.

You may want to split the training into two parts — the information section and the chemical-specific training because of the technical nature of the material. Then you could have one person give all employees the information training, and have area supervisors handle the training for the chemicals used in their work areas (more specific knowledge).

Be sure that whoever does the chemical-specific training thoroughly understands the safe handling aspects of the chemicals he will be covering. Many times a supervisor is more production-oriented rather than safety-oriented, and may emphasize shortcuts that are not recommended for the safe use of a hazardous substance. If you have several people, such as supervisors, conducting training for their work areas, sit in on a session or two, to observe how the training is being handled and to show your support for safety in the workplace.

Having written training programs is your documentation of how you have complied with any training requirements (such as the the Hazard Communication Standard).

This section provides sample training programs that a maintenance pro can use to train technicians on issues that OSHA is concerned with. These programs are designed to be short and easy to use. Ideally, these programs can be completed in 5 to 30 minutes at the start or the end of the workday. They can also be expanded and included in a new-employee orientation.

This is not a full and complete training program. You will need to assess the hazards and behaviors present in your facility to determine if other programs are necessary.

Entrances and exits training

Entrances and exits handout

All buildings must have a way of allowing occupants fast exit to the outside or a safe place of refuge in case of an emergency. Emergency exit routes are not something that you think about all of the time, but a lot of effort goes into making sure they are safe and ready to use.

What is an exit route?

An "exit route" is a clear path of exit travel from any point in a workplace to a place of safety. The exit route can include aisles, stairs, ramps, etc. A workplace must have at least two exit routes that are remote from each other. If a fire or other emergency blocks access to one exit route, the other exit route can be used.

Exit routes must be kept free of obstructing material or equipment, and they must have enough lighting. The purpose of an exit route is to reach an exit — the exit route cannot lead employees toward a dead end or through a room that can be locked.

Compliance Management

The exit route must be wide enough to handle all of the people who may use it.

Signs must be posted along the exit route to show the direction of travel to the nearest exit.

The exit route may not direct employees toward areas where there are unprotected materials that burn very quickly, emit poisonous fumes, or are explosive.

What is an exit?

An “exit” is part of the exit route. Exits are separated from other areas and provide a protected way of travel to the exit discharge. Exits must be separated from the rest of the workplace, and they must be protected by a self-closing fire door.

Each exit must be easy to see and marked with an “Exit” sign.

Any door that might be mistaken for an exit must be marked “Not an Exit” or with a sign showing what the door leads to, “Storeroom” for example.

Exit doors must be easy to open without having to use keys or tools.

Exits must lead to a safe area with enough room for all of the people who are likely to use the exit.

What must my employer do?

Your employer will explain how to locate exits in your facility and what you should do if you are required to exit the building in an emergency.

What must I do?

You must know at least two exits from your area of the workplace.

You must not block or obstruct exits or paths of exit, and alert your employer if you notice exits are blocked.

Entrances and exits training exercise

Exit route tour

Take the trainees on a tour of an exit route that they may need to take during a drill or emergency evacuation. At each point along the way, ask the trainees to note examples of how the exit route meets the regulation’s requirements.

They should be able to point out “Exit” signs, adequate width of the exit route, an exit route that is free of obstructions, direction of travel that doesn’t lead toward hazards, direction of travel marked along the way, the use of fire doors at exits, adequate space for people beyond the exit, etc. When you see an example of how the requirements are being met, be sure to discuss it if the trainees haven’t noticed it.

Notes

Vehicle Maintenance Pro

Notes

Assembly area

Show the trainees the assembly area(s) where they will assemble for a headcount following an emergency evacuation. Explain how the headcount will be handled.

Entry protocol

Show the trainees the entrance(s) they will be expected to use, and demonstrate any company-specific access/check-in procedures for employees and visitors.

Fire Protection

Fire protection handout

Because of the deadly danger of fire, it's to your benefit to know what to do if a fire starts. You should be aware of certain procedures to protect yourself and others from injury during fires and other emergencies. Your employer will conduct regular emergency drills so that you and your coworkers will know what to do and where to proceed during an emergency. You should be familiar with:

- How to report fires, hazardous chemical spills, and other emergencies.
- The route you are assigned to take during a building evacuation.
- Who to ask for more information.

Alarm systems

Most companies use alarm systems to alert employees to evacuate an area or to take a specific action. You must be able to recognize these alarms. In areas where production noise could prevent an alarm from being heard, flashing lights are often installed as a second, visual alarm.

Emergency shutdown of equipment

If time permits before evacuation, turn off any equipment you are operating, such as forklifts or conveyors. Your employer may designate certain workers to shutdown critical facility systems, such as gas and electrical power, before evacuating the work area.

Evacuation

Your employer will develop emergency escape routes for the various locations in your facility. Floor plans or work-area maps clearly define emergency escape routes and are commonly used to convey this information.

Your employer will designate certain employees to take a head count of all workers after evacuation and to inform emergency responders of any missing personnel.

Compliance Management

When a fire starts...

When a fire starts on-site, think first of your safety and the safety of others. Sound the alarm and alert the fire department. Try to put out the fire **only if you have been trained** to use extinguishers, and the fire is small and tame enough to be extinguished by a hand-held extinguisher or whatever other firefighting equipment or supplies are available to you on the job site.

Be aware of smoke and noxious fumes. These fumes enter the lungs and leave persons unconscious and at the mercy of the smoke and flames.

Fire protection exercise

Discussion

Lead trainees in discussing/analyzing fire protection topics as they apply to your workplace. As workers discuss the details of how effective fire prevention devices are, they learn more about them and are better prepared to act in the event of a fire.

The discussion described in the exercise may provide ideas or activities for fire prevention at your facility. Seek cooperation from participants' supervisors and use them to the extent that they are feasible. Tell your trainees' supervisors ahead of time that new ideas may be generated, and seek their support for implementation. Supervisors, in addition, may also be willing to follow-up on and reinforce what trainees have learned in the session — an extremely valuable tool for any trainer.

It is a good idea for companies to discuss specific fire protection measures at their facilities.

Make sure you have enough copies of fire protection handouts so that each participant has his or her own.

Electrical safety

Electrical safety handout

Electricity is an integral part of our lives both at home and in the workplace. Using safe work practices while working on or near de-energized electrical parts can decrease your chances of being injured from electricity.

Employees who work on or near de-energized electrical parts require training on how equipment is de-energized and locked out/tagged out, how to safely work on or near de-energized parts, and what safeguards to use.

How can it hurt me?

High-voltage shocks can cause serious injury or sometimes death. The effects of an electrical shock on the body can range from a tingle to immediate cardiac arrest. Severe shocking can cause more damage than can be seen with the naked eye.

Notes

Vehicle Maintenance Pro

Notes

Electrical currents travel in closed circuits through conducting material. You can receive a shock when a part of your body comes into contact with:

- Both wires of an electrical circuit.
- One wire of an energized circuit and the ground.
- Part of a machine which is “hot” because it is contacting an energized wire and the ground.

What must my employer do?

Your employer will discuss what is expected of you in regards to working with electricity or electrical parts, and inform you of those “qualified persons” who are employed at your facility.

Electrical safety exercise

After concluding the training, have the participants report back at the end of the day any electrical problems located in the facility.

Personal protective equipment (PPE)

Perhaps the most useful type of activity for training on PPE is first demonstrating the proper way to put it on, use it, and take it off. Then, give participants time to work with the equipment themselves, to find out what fits best, and to ask any questions on how it is used.

Follow-up with individual employees after training to watch them work while wearing the PPE, and offer suggestions if they have any problems or questions.

Collect all the types of PPE that your workers will need while they use tools. Provide a variety of sizes so that workers can find PPE that fits.

Lockout/tagout

Lockout/tagout handout

OSHA statistics show that six percent of all deaths in the workplace result from the unexpected activation of a machine or other piece of equipment during maintenance or other servicing.

OSHA developed lockout/tagout regulations which require employers to develop procedures for isolating energy sources when servicing or maintaining equipment and machinery.

Two terms which relate directly to this system are:

Lockout — the placement of a device that blocks the flow of energy from a power source to a piece of equipment.

Tagout — the process of attaching a tag to a disconnect switch or other energy-isolating device to warn others not to restore energy to the tagged equipment.

Who is involved?

Compliance Management

Lockout/tagout involves three types of employees with different levels of responsibility:

- Authorized — employees who perform the servicing, maintenance, and set-up of equipment or machinery and apply the locks and tags to this equipment.
- Affected — employees who operate or use the equipment or machines which are locked/tagged out when servicing, maintained, or set-up.
- Other — employees who are neither affected nor authorized employees.

Lockout devices must:

- Be durable and substantial.
- Identify the person who applied it.
- Only be removed by the person who applied it.

What must my employer do?

Your employer will provide details about the company's lockout/tagout program.

Lockout/tagout exercise

Energy source location

Objectives: For this exercise, you will view slides, overheads, or the actual piece of equipment. Have the trainees locate all the energy sources. Give them several minutes to do this. Then, have a group discussion on the energy sources that they found. Make a list of these energy sources on an overhead, flipchart, or writing board. Make sure that vehicles are included as examples of equipment.

Isolation devices

Objectives: Using the list obtained for the energy source location, have a group discussion on how the energy may be isolated. Discuss the location of the isolating device and how it will be kept in place.

Lockout/tagout demonstration

Objectives: On a piece of equipment, show how to lock it out. Have the employees help with the procedure. First review the written lockout/tagout procedure for this piece of equipment. Then, follow the steps below(in order).

1. Inform affected employees.
2. Locate energy sources.
3. Shutdown equipment.
4. Isolate equipment from energy source.
5. Apply locks and tags.
6. Release stored energy.

Notes

Vehicle Maintenance Pro

Notes

7. Verify isolation of equipment from energy source and release of stored energy.

Note: Consider modifying the lockout/tagout procedure used on shop equipment to include vehicles being repaired, and add the procedures to this training unit. Possible methods include:

- The control of the key switch or start button on vehicles with a mechanical device (lockout).
- The use of a device to not allow the connection of a power unit to a trailer being serviced (lockout).
- The use of tags on vehicles and trailers indicating the only party authorized to start/move the vehicle (tagout).

Machine guarding

Machine guarding handout

Machine guards are your first line of defense against injuries caused by machine operation. Each machine must have adequate safeguards to protect operators from the machine's hazards.

Having an understanding of how a machine works and how the guards can protect you will result in a reduced risk of injury.

All guards must:

- Prevent contact.
- Be secured in place or otherwise be tamper proof.
- Create no new hazard.
- Allow for lubrication with the guard still in place.
- Not interfere with the machine operation.

Types of safeguarding

Several types of safeguarding include:

- Guards — fixed, interlocking, adjustable, or self-adjusting.
- Devices — sensing, pullback, restraint, operational controls, or gates.
- Location or distance — locating the machine so that hazardous areas are not normally accessible.
- Automated feeding and ejection methods - eliminate operator exposure to the hazards.
- Miscellaneous aids — shields, feeding-tools, holding devices, or awareness barriers.

What must I do?

You should always report missing, damaged, or inoperative guards. It is not safe to operate machinery without properly working guards.

Compliance Management

If the guard is damaged or becomes inoperative while you are working, shut the machine down, and have the guard inspected by a qualified person. The guard may need to be repaired or replaced before work can safely proceed.

If unexpected machine start-up could cause injury, use the lockout/tagout program.

Machine guarding exercise

1. Review of operating instructions.

Objectives: As an exercise to reinforce the importance of using guards and following operating procedures, take the trainees on a tour of the machines they work with. Ask employees to identify the guards, operating controls, emergency stops, adjustment points for job set-up, and parts that need routine maintenance (lubrication, cleaning, etc.). Point out how the design of the guard fits the operation of the machine. Demonstrate any adjustments to the guard that may be needed. Have the trainees walk through the operating procedures that they follow to confirm that the machine is being operated properly.

This exercise will work best if it can be scheduled for a time when the machine is not running. Extra copies of the operating instructions should be available for the trainees.

2. Designing machine safeguards.

Objectives: Prepare a table-top exercise for your trainees. The exercise will present the trainees with a machine, and they are to outline how the machine needs to be guarded. Good source material would be one of your company's machines that is going to be modified, or a machine in the process of being built. You could also use plans for new equipment to describe the machine. You will need to describe what the machine is used for, and how it works. The trainees will also need to know where the operators stand and how materials are fed into the machine. Hand out pictures or diagrams of the machine to help the trainees get started.

Slips, trips and falls

Slips, trips, and falls handout

Slips

Slips can be caused by wet surfaces, spills, or weather hazards like ice or snow. Slips are more likely to occur when you hurry or run, wear the wrong kind of shoes, or don't pay attention to where you're walking.

You can help avoid slips by following these safety precautions:

- Practice safe walking skills. Take short steps on slippery surfaces to keep your center of balance under you, and point your feet slightly outward.
- Clean up or report spills right away. Even minor spills can be very dangerous.

Notes

Vehicle Maintenance Pro

Notes

- Don't let grease accumulate at your work place.
- Be extra cautious on smooth surfaces, such as newly-waxed floors. Also, be careful walking on loose carpeting.
- Wear the right shoes for the surfaces being walked on. Increase the friction between shoes and the walking surface by putting down sand or using abrasive strips.
- Make sure to watch where you are going. Never carry loads that you cannot see over.
- Keep work areas well lit.
- Keep work areas clean and free of clutter. Store materials properly. Move, cover, or tape down electrical cords so they are not a hazard.
- Report loose or damaged stair treads, handrails, or carpeting.

Trips

Trips occur whenever your foot hits an object and you are moving with enough momentum to be thrown off balance. You can help avoid trips when you:

- Make sure you can see where you are walking. Don't carry loads that you cannot see over.
- Keep walking and working areas well lit, especially at night.
- Keep the workplace clean and tidy. Store materials and supplies in the appropriate storage areas.
- Arrange furniture and office equipment so that it doesn't interfere with walkways or pedestrian traffic in your area.
- Properly maintain walking areas, and alert appropriate authorities regarding potential maintenance related hazards.

Falls

To avoid falls consider the following measures:

- Don't jump off vehicles, landings, or loading docks. Use the stairs or steps provided.
- Repair or replace stairs, handrails, or steps that are loose or broken.
- Keep passageways and aisles clear of clutter and well-lit.
- Wear shoes with appropriate non-slip soles.

Slips, trips, and falls exercise

Demonstration

Show proper types of footwear for the types of flooring used in your facility. Pay special attention to the types of soles in regard to slip, trip, and fall hazards.

Compliance Management

Explain the ways in which participants can keep their work areas clean and clear of clutter to prevent tripping hazards. Show ways to cover or tape down electrical cords to prevent tripping hazards.

Exercise

Divide participants into small groups. Have them tour the facility and note slip, trip, or fall hazards. You may wish to set up some sample scenarios of unsafe or hazardous situations to allow them to practice (example: mounting and dismounting vehicles and trailers).

Portable tools

Portable tools handout

It's easy to pick up and use a tool without stopping to think about its hazards. It is difficult to remember that tools pose hazards, and sometimes accidents occur before steps can be taken to avoid or eliminate those hazards.

The employer is responsible for the safe condition of tools and equipment used by employees, including tools and equipment which may be furnished by employees.

How can I protect myself?

Choose tools made from good quality, durable materials. Metal tools must be able to resist bending, cracking, chipping, and excessive wear. Wear the appropriate personal protective equipment (PPE). Wear eye, hand, and foot protection.

Everyone has probably suffered a minor scrape, cut, or bruise while using hand- or portable-powered tools, but they can also cause more serious injuries. Saws can sever a nerve, tendon, or blood vessel. A screwdriver can cause a deep puncture wound.

Dropping a heavy tool on your foot could break a bone. Using an electric power tool that is not properly grounded can cause shocks or electrocution. Be aware of the tool's hazards and use appropriate types of protective equipment to help avoid injury.

Use the right tool for the job.

Sometimes using the wrong tool for the job causes an injury. Sometimes using the right tool, but using it incorrectly is the problem. Not inspecting a tool before you use it can lead to an injury if the tool breaks. Damaged tools don't work very well.

Portable tools exercise

Name that tool

You want your employees to use the right tool for the job. Use this exercise to help familiarize the trainees with proper hand- and powered-tool names and uses. This exercise can take three directions.

Notes

Vehicle Maintenance Pro

Notes

If you don't have enough trainees to set up teams, the best approach would be to bring in examples of all the tools that the workers will be using. Have the trainees work together to identify each tool and its intended use. You can take this exercise a step further and ask the trainees to name the tool's parts, bits, blades, attachments, etc. Having the tools at the training session also provides you with an opportunity to demonstrate tool inspection. This may be the best approach for new or inexperienced employees.

A second approach would work with smaller groups. For this exercise you do not necessarily have to have the tools present. Tell the trainees that they are going to have to build or repair an item and ask them to work together to come up with a list of the tools that they would need for the project. Give them as much detail about the project as you can. Tell them what supplies are available, but don't suggest the types of tools that would be needed. When you go over the lists after everyone is finished, ask the trainees about any personal protective equipment that they would need for the job.

The third approach works best when you can have two or more teams. Each team should have at least two people, but no more than four. They will need a buzzer or other noisemaker to buzz in with their answers. For this exercise, describe how a tool is used, and describe the parts of the tool. The first team that can identify it should buzz in with the answer. Other teams get a chance if the answer is incorrect. Questions can count for less points as more description is given before a team has the answer. If you want to bring tools in for this exercise, keep them covered. Then, during a lightning round, uncover each tool and award points to the first team to identify it.

Welding safety program

Welding handout

Your employer will review the company welding safety program with you. Whenever working welding or working around welding and other hot work, you should know:

- The name and job title of the person responsible for safety in welding operations.
- The job hazards associated with welding such as: hazards from fumes and gases, radiation hazards, fire hazards, noise hazards, and electrical hazards.
- Any special procedures for the equipment being used, such as: care of compressed gas cylinders, the use of ventilation, and fire prevention methods.
- The use of engineering controls, such as flash screens and fire blankets.
- The necessary personal protective equipment required for the work being done.

Compliance Management

Welding hazards

Welding can cause a variety of hazards, including:

- Damage to skin and eyes from exposure to ultraviolet and infrared rays produced by welding.
- Welding and cutting operations.
- Fire hazards from welding or cutting near or on combustible or flammable materials, dust, vapor, or the environment.
- Explosion hazards from lack of ventilation.

How can I protect myself and others?

Here are a few practices for working safely that apply in welding situations.

When working above ground or floor level, use a platform with toeboards and standard railings or safety belt and life line. Also protect workers from stray sparks or slag in the area below an elevated surface where welding is taking place.

Aim the welding torch away from cement or stone surfaces. Moisture within these materials could cause them to explode when they reach a certain temperature.

When finished welding or cutting, warn other workers of hot metal by marking or putting up a sign. Keep floors clean by putting electrode or rod stubs in an appropriate container. Keep floors clear of tripping hazards; store tools safely.

Never use bare conductors, damaged regulators, torches, electrode holders, or other defective equipment.

Do not an arc or resistance welder while standing on damp surfaces.

Welding exercises

Hot work permit

Pass out samples of the company hot work permit. Explain when such hot work permits are required, who can issue them, and why they are necessary.

Using a blank hot work permit, have each participant fill it out, using information you have provided.

Using an overhead projector, or printed sample, provide trainees with an improperly filled out hot work permit. Have participants explain why the hot work permit is not properly filled out.

Compressed gas cylinder storage

Show participants where the welding gases are stored. Explain how the gases are stored, separation of empty and full cylinders, and how they are secured in storage.

Notes

Vehicle Maintenance Pro

Notes

Demonstrate how to properly move and secure cylinders for use. Allow participants to handle a cylinder (possibly an empty one, with protective cap in place).

Fire watch exercise

Divide participants into small groups. Read the scenario to them, and allow them time to discuss the root causes of each. Discuss as a group.

“A fire occurred when a contractor was installing a new passenger elevator. During the process, a metal plate with predrilled holes was to be installed. Because the predrilled holes did not line up properly, the contractor had to cut new holes using an acetylene torch. No hot work permit was obtained for this modification, nor were safety personnel notified that a welding operation would be conducted.

When the cutting job had been completed, a worker posted as fire watch heard a hissing sound and discovered that stray hot slag had fallen near the oxygen-supply line. This line was located well beyond the area where slag would be expected to fall. The fire watch grabbed the line with a gloved hand to cover the leak. At this point, the oxygen-supply line ignited with a flash, causing second-degree burns to the worker’s hand. When other workers shut off the oxygen supply to the tanks, the fire subsided. The injured worker was taken immediately to the health unit, then to a local hospital for treatment. Safety personnel were promptly notified, and work on the project was stopped until an investigation could be completed.”

The discussion of safety violations should include failure to:

Obtain a hot work permit.

Notify host safety department of hot work.

Remove or guard hazards near the work area.

[illegible]

Vehicle Maintenance Pro

Notes

provision says EPA can only enforce the standards in states that are not RCRA-authorized, until the states adopt the waste oil rules on their own.

- **Refrigerants** — Refrigerants containing chlorofluorocarbons (CFCs) have historically been used for refrigeration and air conditioning. When released into the air, CFCs rise into the upper layer of the earth's atmosphere. Scientific studies have concluded that the chemical reactions of CFCs and related chemicals in the atmosphere result in the depletion of the ozone layer, which protects the earth from the sun's radiation. Title VI of the Clean Air Act Amendments of 1990 requires a complete phase-out of CFCs. The specific requirements of Title VI restrict the production of ozone-depleting chemicals, and regulate their use, emissions, and disposal. Companies that sell or repair vehicle air conditioners are required to purchase and use equipment for recycling CFCs. In addition, persons using CFC recycling equipment must be certified. Title VI also requires warning labels to be placed on all containers of CFCs.
- **Used batteries** — While used lead-acid batteries — which contain lead, sulfuric acid, and plastic — may seem to be one of the most environmentally-unfriendly portions of a truck, they are in most cases successfully recycled. Estimates go as high as 95% of all spent batteries being recycled. Since there is inherent value in a spent battery, many battery manufacturers provide a "trade-in" service when new batteries are purchased, with the old battery's value being applied against the cost of the new one, and the manufacturer providing a haul-away service. However, used batteries may be considered "universal waste" per 40 CFR Part 279 in certain circumstances.
- **Underground storage tanks (UST) for fuel** — Since a 1986 RCRA amendment set up the Leaking Underground Storage Tank Trust Fund (LUST) which was to be financed through fuel taxes, and SARA established a program for UST leaks, overflows and other releases in the same year, underground storage tanks have been the focus of considerable attention. The Energy Policy Act of 2005 significantly increased the EPA's regulation of USTs. The UST provisions of the Energy Policy Act focus on preventing releases. Among other things, it expands eligible uses of the LUST Fund and includes provisions regarding inspections, operator training, delivery prohibition, secondary containment and financial responsibility, and cleanup of releases that contain oxygenated fuel additives. See the sections to follow for more specifics. EPA regulations in Parts 280 and 281 of 40 CFR deal with the subject. See the Compliance section of this manual.
- **Above ground storage tanks (AST)** — ASTs, which are an alternative to USTs, are also regulated by the EPA and/or the associated local or state agencies.
- **Wastewater** — If your business is discharging water into the municipal sewer system, into a septic field, or into local waters, there are regulations pertaining to the permitting of the facility,

Compliance Management

content of the water, and the pretreatment of the water before discharge. These regulations raise the issue of what to do with the waste water generated as part of their normal maintenance operations, such as washing of vehicles and parts.

- **Stormwater** — Stormwater runoff, a wastewater disposal issue — fleets have two separate concerns in the area of water — how to deal with stormwater runoff and minimization of contaminants leaving their maintenance site during storms of any kind. The EPA regs in Part 122 of 40CFR contain these requirements.
- **Emergency planning and preparation** — Emergency planning and preparation is a critical component in an EPA compliance program. This includes complying with the HazComm and SARA requirements.
- **Vehicle emissions and fuel standards** — The EPA has been progressively tightening the emission standards on vehicles. The emission standards for particulate discharge and other contaminants has been significantly reduced. This action will continue, with the next reduction in emission standards coming in 2010. All heavy trucks built in 2007 must meet the new emission standards and must be designed to use the ultra low sulfur diesel. The EPA also has regulations in place which require the vehicle to meet the emissions standards in place the year the vehicle was built. One “push” by the EPA in the emissions area has been programs to reduce idling of large vehicles. The agency has provided “model legislation” for use by state and local units of government, and has established the “Smartway Transportation Partnership” program to assist carriers with reducing idling. The Smartway program works with carriers by providing them with incentives and advice on idle-reducing systems and technologies, as well as policies. For more information on the Smartway program go to the EPA’s website at: <http://www.epa.gov/smartway/>. This topic is covered in the Vehicle Systems section of this manual.

The next several pages take a detailed look at the EPA programs listed above that have an impact on the operations of a maintenance facility. But first, let’s take a look at the EPA’s guiding principles when it comes to programs they operate.

As the nation’s environmental laws and regulations have developed over the past three decades, a new paradigm has shifted the approach to waste management. Initially, EPA focused on managing the pollution generated through treatment and disposal in an environmentally-safe manner. However, we have learned that conventional treatment and disposal can transfer pollutants from one medium to another with no net reduction.

Recognizing that source reduction is more desirable than treatment and disposal, EPA now emphasizes preventing or eliminating the generation of waste. The Pollution Prevention Act of 1990 (PPA) established pollution prevention (referred to as “P2”) as a national objective. In striving to meet the new and often more stringent environmental laws, industries have found ways to reduce or prevent pollution at the source.

Notes

Vehicle Maintenance Pro

Notes

Pollution prevention is indirectly defined in the PPA as source reduction. Source reduction is any practice that reduces or eliminates the creation of pollutants. Thus, the amount of any hazardous substance, pollutant, or contaminant entering any waste stream or otherwise released into the environment is reduced prior to recycling, treatment, or disposal. Source reduction can be achieved through equipment or technology modifications, process or procedural modifications, reformulation or redesign of products, substitution of raw materials, or improvements in housekeeping, maintenance, training, or inventory control.

The PPA established a pollution prevention hierarchy as national policy, declaring that:

- Pollution should be prevented or reduced at the source.
- Pollution that cannot be prevented should be recycled in an environmentally-safe manner.
- Pollution that cannot be prevented or recycled should be treated in an environmentally-safe manner.
- Disposal or other release into the environment should be employed only as a last resort and should be conducted in an environmentally-safe manner.

Thus, under the PPA, recycling, energy recovery, treatment, and disposal are not included within the definition of pollution prevention. However, some practices commonly described as “inprocess recycling” may qualify as pollution prevention. Although recycling is not pollution prevention, as indicated in the hierarchy, it is the next desirable practice where pollution cannot be prevented or reduced. Recycling conducted in an environmentally-sound manner shares many of the advantages of prevention as it can reduce the need for treatment or disposal and conserve energy and resources.

EPA's Office of Pollution Prevention and Toxic Substances (OPPTS) developed a pollution prevention strategy for incorporating pollution prevention concepts into EPA's ongoing environmental protection efforts. The specific objectives of the strategy are to provide guidance and direction for efforts to incorporate pollution prevention within EPA's existing regulatory and nonregulatory programs, and to set forth an initiative to achieve specific objectives in pollution prevention within a reasonable time frame.

Specific EPA programs and requirements

Hazardous waste

While the majority of the EPA's programs have adopted this PPA philosophy, several of the programs the agency operates are still based on the older concepts of reclamation and recycling to minimize pollution. The hazardous waste program is one such program.

Compliance Management

What is hazardous waste? Do hazardous waste regulations apply to your operations? If so, where do you start, what must you do? These are the questions this section will answer.

In 1976, Congress passed the Resource Conservation and Recovery Act (RCRA) which directed the U.S. Environmental Protection Agency (EPA) to develop and implement a program to protect human health and the environment from improper hazardous waste management practices. The program is designed to control the management of hazardous waste from its generation to its ultimate disposal — from “cradle-to-grave.”

EPA first focused on large companies, which generate the greatest portion of hazardous waste. Business establishments producing less than 1,000 kilograms (2,200 pounds) of hazardous waste in a calendar month (known as small quantity generators) were exempted from most of the hazardous waste management regulations published by EPA in May 1980.

In recent years, however, public attention has been focused on the potential for environmental and health problems that may result from mismanaging even small quantities of hazardous waste. For example, small amounts of hazardous waste dumped on the land may seep into the earth and contaminate underground water that supplies drinking water wells.

In November 1984, the Hazardous and Solid Waste Amendments (HSWA) were signed into law, amending RCRA. With these amendments, Congress directed EPA to establish new requirements that would bring small quantity generators who generate between 100 and 1,000 kilograms (kg) of hazardous waste in a calendar month into the hazardous waste regulatory system.

EPA issued final regulations for these 100 to 1,000 kg/mo generators on March 24, 1986. Most of the requirements were effective September 22, 1986. However, certain storage requirements went into effect March 1987; exception reporting, March 1988.

The Toxicity Characteristic Rule became effective for small quantity generators on March 29, 1991. The rule added 25 organic chemicals (including regulatory levels) to the existing list of RCRA-regulated chemicals. The rule also replaced the Extraction Procedure leach test with the Toxicity Characteristic Leaching Procedure (TCLP).

What is a hazardous waste? A hazardous waste is a waste with properties that make it dangerous or potentially harmful to human health or the environment. The universe of hazardous wastes is large and diverse. Hazardous wastes can be liquids, solids, contained gases, or sludges. They can be the by-products of manufacturing processes or simply discarded commercial products, like cleaning fluids or pesticides.

In regulatory terms, a RCRA hazardous waste is a waste that appears on one of the four hazardous wastes lists (F-list, K-list, P-list, or U-list), or exhibits at least one of four characteristics — ignitability, corrosivity, reactivity, or toxicity. Hazardous waste is presently regulated under Subtitle C of the RCRA .

Notes

Vehicle Maintenance Pro

Notes

Listed wastes. By definition, EPA determined that some specific wastes are hazardous. These wastes are incorporated into lists published by the Agency. These lists are organized into three categories:

- The F-list (non-specific source wastes) identifies wastes from common manufacturing and industrial processes, such as solvents that have been used in cleaning or degreasing operations. Because the processes producing these wastes can occur in different sectors of industry, the F-listed wastes are known as wastes from non-specific sources. Wastes included on the F-list can be found in the regulations at 40 CFR §261.31.
- The K-list (source-specific wastes) includes certain wastes from specific industries, such as petroleum refining or pesticide manufacturing. Certain sludges and wastewaters from treatment and production processes in these industries are examples of source-specific wastes. Wastes included on the K-list can be found in the regulations at 40 CFR §261.32.
- The P-list and the U-list (discarded commercial chemical products) include specific commercial chemical products in an unused form. Some pesticides and some pharmaceutical products become hazardous waste when discarded. Wastes included on the P- and U-lists can be found in the regulations at 40 CFR §261.33.

Wastes with specific characteristic. Waste that does not meet any of the listings explained above may still be considered a hazardous waste if exhibits one of the four characteristics defined in 40 CFR Part 261 Subpart C — ignitability (D001), corrosivity (D002), reactivity (D003), and toxicity (D004 - D043).

- **Ignitability** — Ignitable wastes can create fires under certain conditions, are spontaneously combustible, or have a flash point less than 60°C (140°F). Examples include waste oils and used solvents. For more details, see 40 CFR §261.21.
- **Corrosivity** — Corrosive wastes are acids or bases (pH less than or equal to 2, or greater than or equal to 12.5) that are capable of corroding metal containers, such as storage tanks, drums, and barrels. Battery acid is an example. For more details, see 40 CFR §261.22.
- **Reactivity** — Reactive wastes are unstable under normal conditions. They can cause explosions, toxic fumes, gases, or vapors when heated, compressed, or mixed with water. Examples include lithium-sulfur batteries and explosives. For more details, see 40 CFR §261.23.
- **Toxicity** — Toxic wastes are harmful or fatal when ingested or absorbed (e.g., containing mercury, lead, etc.). When toxic wastes are land disposed, contaminated liquid may leach from the waste and pollute ground water. Toxicity is defined through a laboratory procedure called the Toxicity Characteristic Leaching Procedure (TCLP). The TCLP helps identify wastes likely to leach concentrations of contaminants that may be harmful to human health or the environment. For more details, see 40 CFR §261.24.

Compliance Management

As a business, it is your responsibility to determine if your wastes are considered hazardous. The EPA regulations in the next section includes a list of hazardous wastes and the methodology for deciding if a waste is indeed a hazardous waste.

Three of the most common wastes of concern that are generated in vehicle maintenance shops (tires, waste oil, and batteries) are not handled as hazardous waste, unless they have been contaminated by a waster that meets the hazardous waste definition (batteries may or may not be classified as hazardous waste, depending on the recycling intent and content of the battery). However, they are addressed in other EPA regulations. These items are covered as separate topics later in this chapter.

What is a “generator” — Hazardous waste is created by what the EPA refers to as “generators.” A generator is any person, or site, whose processes and actions create hazardous waste. There are now three categories of generators:

- Large Quantity Generators, who generate over 1,000 kilograms of hazardous waste per month.
- Small Quantity Generators, who generate 100-1,000 kilograms of hazardous waste per month.
- Conditionally Exempt Small Quantity Generators (CESQG) generate 100 kilograms or less per month of hazardous waste, or 1 kilogram or less per month of acutely hazardous waste.

As the volume of hazardous waste increases, so does the number of government regulations. Here is an explanation of the three categories of generators:

Large Quantity Generators (LQG) generate 1,000 kilograms per month or more of hazardous waste, or more than 1 kilogram per month of acutely hazardous waste. Requirements for LQGs include:

- LQGs may only accumulate waste on site for 90 days. Certain exceptions apply.
- LQGs do not have a limit on the amount of hazardous waste accumulated on site.
- There must always be at least one employee available to respond to an emergency.
- This employee is the emergency coordinator responsible for coordinating all emergency response measures.
- LQGs must have detailed, written contingency plans for handling emergencies.
- LQGs must submit a biennial hazardous waste report.

Notes

Vehicle Maintenance Pro

Notes

Small Quantity Generators (SQG) generate more than 100 kilograms, but less than 1,000 kilograms, of hazardous waste per month. Requirements for SQGs include:

- SQGs may accumulate hazardous waste on site for 180 days without a permit (or 270 days if shipping a distance greater than 200 miles).
- The quantity of hazardous waste on site must never exceed 6,000 kilograms.
- There must always be at least one employee available to respond to an emergency.
- This employee is the emergency coordinator responsible for coordinating all emergency response measures.
- SQGs are not required to have detailed, written contingency plans for handling emergencies.

Conditionally Exempt Small Quantity Generators (CESQG) generate 100 kilograms or less per month of hazardous waste, or 1 kilogram or less per month of acutely hazardous waste. Requirements for CESQGs include (see also 40 CFR 261.5):

- CESQGs must identify all the hazardous waste generated.
- CESQGs may not accumulate more than 1,000 kilograms of hazardous waste at any time.
- CESQGs must ensure that hazardous waste is delivered to a person or facility who is authorized to manage it.

All large and small quantity generators are required to (see also 40 CFR 262):

- Obtain an EPA Identification number (available from your state environmental office).
- Comply with the uniform hazardous waste manifest system.
- Handle wastes properly before shipment (packaging, labeling, marking, placarding, accumulation time, etc.).
- Comply with record keeping and reporting requirements.

Regulatory reminder. Note that some states may have additional requirements in the area of hazardous waste. You should contact your state environmental control office, the regional EPA office, or a national trade association (or its local chapter) to familiarize yourself with any state/local requirements that may apply to you.

EPA Identification Number. A LQG or SQG must not treat, store, dispose of, transport, or offer for transportation, hazardous waste without having received an EPA Identification Number issued by the EPA. Transporters and facilities that store, treat, or dispose of hazardous waste must also have an EPA Identification Number.

These twelve character identification numbers, used by both EPA and the states, are part of a national data base to track hazardous waste activities. The application for the number serves the purpose of notifying

Compliance Management

the state and federal government that your company is involved in hazardous waste activity. The ID number that you receive is used on all documents relating to hazardous waste: manifests, biennial reports, labels.

To get your U.S. EPA Identification Number call or write your state hazardous waste management agency or your EPA regional office and ask for a copy of EPA Form 8700-12. Note: A few states use a form that is different from the federal form shown in the sample. Your state will send you the appropriate form to complete.

Complete all parts for 1 through 6.

Y ☐ N ☐ 1. Generator of Hazardous Waste

If "Yes", choose only one of the following - a, b, or c.

- ☐ a. LQG: Greater than 1,000 kg/mo (2,200 lbs./mo.) of non-acute hazardous waste; or
- ☐ b. SQG: 100 to 1,000 kg/mo (220 - 2,200 lbs./mo.) of non-acute hazardous waste; or
- ☐ c. CESQG: Less than 100 kg/mo (220 lbs./mo.) of non-acute hazardous waste

In addition, indicate other generator activities.

Y ☐ N ☐ d. United States Importer of Hazardous WasteY ☐ N ☐ e. Mixed Waste (hazardous and radioactive) Generator**Y ☐ N ☐ 2. Transporter of Hazardous Waste****Y ☐ N ☐ 3. Treater, Storer, or Disposer of Hazardous Waste (at your site)** Note: A hazardous waste permit is required for this activity.**Y ☐ N ☐ 4. Recycler of Hazardous Waste (at your site)****Y ☐ N ☐ 5. Exempt Boiler and/or Industrial Furnace**

If "Yes", mark each that applies.

- ☐ a. Small Quantity On-site Burner Exemption
- ☐ b. Smelting, Melting, and Refining

Y ☐ N ☐ 6. Underground Injection Control**B. Universal Waste Activities****Y ☐ N ☐ 1. Large Quantity Handler of Universal Waste (accumulate 5,000 kg or more) [refer to your State regulations to determine what is regulated]. Indicate types of universal waste that apply:**Manage

- a. Batteries ☐
- b. Pesticides ☐
- c. Mercury containing equipment ☐
- d. Lamps ☐
- e. Other (specify) ☐
- f. Other (specify) ☐
- g. Other (specify) ☐

Y ☐ N ☐ 2. Destination Facility for Universal Waste

Note: A hazardous waste permit may be required for this activity.

C. Used Oil Activities

Mark all boxes that apply.

Y ☐ N ☐ 1. Used Oil Transporter If "Yes", mark each that applies.

- ☐ a. Transporter
- ☐ b. Transfer Facility

Y ☐ N ☐ 2. Used Oil Processor and/or Re-refiner If "Yes", mark each that applies.

- ☐ a. Processor
- ☐ b. Re-refiner

Y ☐ N ☐ 3. Off-Specification Used Oil Burner**Y ☐ N ☐ 4. Used Oil Fuel Marketer**

If "Yes", mark each that applies.

- ☐ a. Marketer Who Directs Shipment of Off-Specification Used Oil to Off-Specification Used Oil Burner
- ☐ b. Marketer Who First Claims the Used Oil Meets the Specifications

EPA Form 8700-12 (Revised 7/2006)

Page 2 of 3

EPA ID NO: _____	OMB#: 2050-0028 Expires 06/30/2009

11. Description of Hazardous Wastes (See instructions on page 21.)						
A. Waste Codes for Federally Regulated Hazardous Wastes. Please list the waste codes of the Federal hazardous wastes handled at your site. List them in the order they are presented in the regulations (e.g., D001, D003, F007, U112). Use an additional page if more spaces are needed.						
B. Waste Codes for State-Regulated (i.e., non-Federal) Hazardous Wastes. Please list the waste codes of the State-regulated hazardous wastes handled at your site. List them in the order they are presented in the regulations. Use an additional page if more spaces are needed for waste codes.						
12. Comments (See instructions on page 21.)						
13. Certification. I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations. For the RCRA Hazardous Waste Part A Permit Application, all operator(s) and owner(s) must sign (see 40 CFR 270.10 (b) and 270.11). (See instructions on page 21.)						
Signature of operator, owner, or an authorized representative	Name and Official Title (type or print)				Date Signed (mm/dd/yyyy)

Notes

waste numbers, check in the EPA Regulations under §261.32-.33. If you do not understand the information in the Appendix, or if you cannot match your wastes with those listed, seek help from one of the previously-mentioned sources.

One site — One number. If you have several sites or business locations where you produce or handle hazardous wastes, you will need to complete one copy of the form for each site. Each site will receive its own EPA Identification Number.

Once you make sure your form is filled out completely and correctly, sign the certification in Item 13. Send the form to the state hazardous waste agency or if your state requires it, to the appropriate regional EPA office. Be sure to check with either the regional EPA office or the state environmental office for the proper mailing address.

The information on the form will be recorded by both EPA and the state. You will then be assigned an EPA Identification Number. This number will be unique to the site identified on your form. Use this number on all hazardous waste paperwork requiring an EPA Identification Number. The hazardous waste manifest, for instance, in space 1, requires you to list your EPA Identification Number.

The EPA Identification Number will stay with the business site or location that you registered. If you move to another location, you must notify EPA or the state and submit a new form. If the new location previously handled hazardous waste, and already had an ID number, you will be assigned that number for the site after you have notified EPA.

If you store, treat, or dispose of your hazardous waste on site in any manner (other than the permissible recycling and reclamation described in the regulations), you must obtain a permit. This step should not be taken lightly.

TSD permitting — Obtaining a permit to store, treat, or dispose of your hazardous wastes on your site can be a costly and very time-consuming process. This process is described in 40 CFR Part 270. To obtain such a permit you must:

- Notify the EPA regional office or your state office of environmental control of your hazardous waste activity.
- Apply for a Hazardous Waste Permit (this is a different credential than an EPA Identification Number). The forms are available through the EPA regional office or your state office of environmental control.
- Complete Part 10A of the 8700-12 correctly (you will need to refile the 8700-12 to reflect your new activity).
- Comply with the standards described in 40 CFR Parts 264, 265, 266, and 270.

Remember, as long as you do not exceed the limitations discussed earlier in the generator discussion, you are only considered a generator. If you exceed the limitation for your type of generator, then you will have to apply for a TSD permit as a storer.

Compliance Management

If you are not sure whether you qualify as a storer or transporter of hazardous waste, or if you are interested in finding out more about the subject, call your state hazardous waste management agency or EPA regional office for help.

Hazardous waste transportation — The next step involved in hazardous waste normally involves getting it hauled away. Bear in mind the phrase “cradle-to-grave” responsibility. This means that if you produce the waste, it is your responsibility forever. You must ensure that it is hauled properly, and disposed of or treated properly.

Therefore, carefully choosing a hauler and designating a waste management facility is very important. You want to make sure that you are dealing with reputable haulers and disposers. The hauler will be handling your wastes beyond your control while you are still responsible for their proper management. Similarly, the waste management facility will be the final destination of your hazardous waste for treatment, storage, or disposal.

If your transporter takes your drums of hazardous waste and dumps them out on some back road, he will be fined, but YOU will have to help pay for the cleanup. Cleanup costs for a simple spill of several drums of hazardous waste that have soaked into the ground can be hundreds of thousands of dollars.

Therefore, before choosing a hauler and/or designating a facility, check with the following sources, if possible:

- Associates in the same business as you who may have used a specific hazardous waste hauler or designated facility in the past and were satisfied.
- Trade associations, which may keep a file on companies that have a good reputation for handling hazardous wastes.
- Your Better Business Bureau or Chamber of Commerce to find out if any complaints have been registered against a hauler or facility.
- Your state hazardous waste management agency or EPA regional office, which can tell you whether or not the company has a U.S. EPA ID number, and may know whether or not the company has had any problems.

Also, make sure that they have the necessary permits and insurance, and that the hauler’s vehicles are in good condition.

After checking these sources, make your selection of a hauler and a disposal site. Contact both the transporter and the designated disposal facility directly to verify that they have EPA Identification Numbers, and that they can and will handle your waste.

This process can be time-consuming, so start checking well ahead of the time that you will need to ship your waste. Careful selection is very important.

Notes

Vehicle Maintenance Pro

Notes

To prepare a hazardous waste for treatment you must:

- Package the waste in accordance with the applicable Department of Transportation regulations on packaging under 49 CFR Parts 173, 178, and 179.
- Label each package in accordance with the applicable Department of Transportation regulations on hazardous materials under 49 CFR Part 172.
- Mark each package of hazardous waste in accordance with the applicable Department of Transportation regulations on hazardous materials under 49 CFR Part 172.
- Mark each container of 119 gallons or less used in such transportation with the following words and information in accordance with the requirements of 49 CFR 172.304:

HAZARDOUS WASTE — Federal Law Prohibits Improper Disposal. If found, contact the nearest police or public safety authority or the U.S. Environmental Protection Agency.

Generator's Name and Address _____.

Generator's EPA Identification Number _____.

Manifest Tracking Number _____.

Finally, as the generator you must complete a hazardous waste manifest.

The hazardous waste manifesting system is designed to seamlessly track hazardous waste from the time it leaves the generator facility where it was produced, until it reaches the off-site waste management facility that will store, treat, or dispose of the hazardous waste.

The system allows the waste generator to verify that its waste has been properly delivered, and that no waste has been lost or unaccounted for in the process. The key component of this system is the Uniform Hazardous Waste Manifest (UHW). This form is prepared by all generators who transport, or offer for transport, hazardous waste for off-site treatment, recycling, storage, or disposal.

The manifest is required by both Department of Transportation and EPA. Each party that handles the waste signs the manifest and retains a copy for themselves. This ensures critical accountability in the transportation and disposal processes. Once the waste reaches its destination, the receiving facility returns a signed copy of the manifest to the generator, confirming that the waste has been received by the designated facility.

Compliance Management

On the following pages you will find a sample copy of a uniform hazardous waste manifest. Look this over. When you sign the certification in ITEM 15 you are personally confirming that:

- The manifest is complete and accurately describes the shipment.
- The shipment is ready for transport.
- You have considered whether, given your budget, your waste management arrangements are the best to reduce the amount and hazardous nature of your wastes.

REMEMBER: Just because you have shipped the hazardous waste off your site and it is no longer in your possession, your liability has not ended. You are potentially liable for any mismanagement of your hazardous waste.

Waste tires

The Environmental Protection Agency (EPA) has compiled a summary of each state's scrap tire management legislation and programs in a publication, *State Scrap Tire Programs, A Quick Reference Guide (updated last in 1999)*. This guide is intended to provide state regulators, as well as members of industry, with a quick reference on state scrap tire programs across the country.

Vehicle Maintenance Pro

Notes

The guide contains eight sections for each state program:

- The State Contact section provides the name, address, phone number, and fax number of the scrap tire program manager for the state. Websites and e-mail information are given when available.
- The Legislation and Regulations section briefly outlines the history of scrap tire legislation for the state.
- The Funding Sources/Fees section addresses the state funds and collection fees authorized by the state.
- The Collector, Seller, and Hauler Regulations section summarizes the regulations that apply to these entities.
- The Storage and Processor Regulations and the Disposal Restrictions sections outline relevant regulatory requirements.
- The Financial/Market Incentives section discusses grants and other programs that foster better scrap tire disposal/recycling waste management and reduction.
- The Additional Information section provides information about activities of interest related to scrap tires in a particular state, such as special field tests or studies, and innovative uses for scrap tires.

The guide can be accessed on EPA's website at www.epa.gov/epaoswer/non-hw/tires/scrapti.pdf or obtained from the RCRA/Superfund Hotline at (800) 424-9346.

Even with all of the reuse and recycling efforts, almost one-quarter of scrap tires end up in landfills each year. Landfilling scrap tires can cause problems due to their uneven settlement and tendency to rise to the surface, which can harm landfill covers. To minimize these problems, many states require chipping or grinding of tires prior to disposal. Sometimes scrap tires are also incorporated into the landfill itself as part of daily cover, or in a landfill cap.

In recent years, the placement of shredded scrap tires in monofills — a landfill, or portion of a landfill, that is dedicated to one type of material — has become more common. Monofills may be used where no other markets are available and municipal solid waste landfills do not accept tires. Monofills are preferable to above ground storage of tires in piles, due to fire hazards and human health hazards. State landfill regulations:

- 38 states ban whole tires from landfills.
- 35 states allow shredded tires to be placed in landfills.
- 11 states ban all tires from landfills.
- 17 states allow processed tires to be placed into monofills.
- 8 states have no restrictions on placing scrap tires in landfills.

Because waste tires are managed at the state level, and there is a wide variation in the state regulations, a maintenance pro will need to use the EPA materials to locate the correct state contact to determine what is necessary to comply.

Compliance Management

Waste oil

EPA issued a final rule on May 20, 1992, which effectively was a decision not to decide, at least for the time being. Waste oil (used oil) destined for disposal will not be specifically listed as a hazardous waste, according to the agency. The non-decision was made, based on the fact that all used oils do not always meet the technical criteria for being listed as a hazardous waste. Therefore, the regulatory status quo was preserved in the case of used oil.

This section summarizes the EPA's used oil management standards — a set of “good housekeeping” requirements for used oil handlers. These requirements are detailed in Title 40 CFR Part 279.

Why does the EPA take used oil so seriously? It is the main pollutant found in drinking water. In very graphic terms, a single gallon of waste oil can ruin a million gallons of fresh water, and make it unsuitable for drinking. To make matters worse, a great deal of used oil finds its way into the water table because various people pour it down sewers or onto the ground at the rate of more than 100 million gallons per year.

Why is it so dangerous? First of all, oil is insoluble, it won't dissolve in water. Second, it is persistent — in other words, it doesn't break down easily. Finally, used oil contains a mixture of chemicals and heavy metals (particularly lead) which are hazardous to health.

EPA's regulatory definition of used oil is as follows: Used oil is any oil that has been refined from crude oil or any synthetic oil that has been used and as a result of such use is contaminated by physical or chemical impurities.

Simply put, used oil is exactly what its name implies — any petroleum-based or synthetic oil that has been used. During normal use, impurities such as dirt, metal scrapings, water, or chemicals can get mixed in with the oil, so that in time the oil no longer performs well. Eventually, this used oil must be replaced with virgin or re-refined oil to do the job at hand. EPA's used oil management standards include a three-pronged approach to determine if a substance meets the definition of used oil. To meet EPA's definition of used oil, a substance must meet each of the following three criteria:

- **Origin** — The first criterion for identifying used oil is based on the origin of the oil. Used oil must have been refined from crude oil or made from synthetic materials. Animal and vegetable oils are excluded from EPA's definition of used oil.
- **Use** — The second criterion is based on whether and how the oil is used. Oils used as lubricants, hydraulic liquids, heat transfer fluids, buoyants, and for other similar purposes are considered used oil. Unused oil such as bottom clean-out waste from virgin fuel oil storage tanks or virgin fuel oil recovered from a spill, do not meet EPA's definition of used oil because these oils have never been “used.” EPA's definition also excludes products used as cleaning agents or solely for their solvent properties, as well as certain petroleum-derived products like antifreeze and kerosene.

Notes

Vehicle Maintenance Pro

Notes

- **Contaminants** — The third criterion is based on whether or not the oil is contaminated with either physical or chemical impurities. In other words, to meet EPA's definition, used oil must become contaminated as a result of being used. This aspect of EPA's definition includes residues and contaminants generated from handling, storing, and processing used oil. Physical contaminants could include metal shavings, sawdust, or dirt. Chemical contaminants could include solvents, halogens, or saltwater.

Here are four quick definitions of the parties involved in used oil production and movement that are important to know when discussing used oil:

- **Generators** are businesses that handle used oil through commercial or industrial operations or from the maintenance of vehicles and equipment. Generators are the largest segment of the used oil industry. Examples of common generators are car repair shops, service stations, quick lube shops, government motor pools, grocery stores, metal working industries, and boat marinas. Farmers who produce less than an average of 25 gallons of used oil per month are excluded from generator status. Individuals who generate used oil through the maintenance of their personal vehicles and equipment are not subject to regulation under the used oil management standards.
- **Collection centers** and aggregation points are facilities that accept small amounts of used oil and store it until enough is collected to ship it elsewhere for recycling. Collection centers typically accept used oil from multiple sources that include both businesses and individuals. Aggregation points collect oil only from places run by the same owner or operator and from individuals.
- **Transporters** are companies that pick up used oil from all sources and deliver it to re-refiners, processors, or burners. Transfer facilities include any structure or area where used oil is held for longer than 24 hours, but not longer than 35 days. Examples of transfer facilities are loading docks and parking areas.
- **Burners** burn used oil for energy recovery in boilers, industrial furnaces, or in hazardous waste incinerators. Generators are allowed to burn used oil in space heaters provided they burn only their own used oil and used oil provided by household do-it-yourself generators, the waste oil is not contaminated, the space heater has a capacity of less than 500,000 BTUs per hour, and the combustion gases are correctly vented.

If your facility generates used oil, there are certain good housekeeping practices that you must follow. These management standards are common sense, good business practices designed to ensure the safe handling of used oil, to maximize recycling, and to minimize disposal. The standards apply to all used oil handlers, regardless of the amount of the oil they handle. Although different used oil handlers may have specific requirements, the following requirements are common to all types of handlers. These requirements relate to storage and to cleaning up leaks and spills, as follows:

Compliance Management

- Label all containers and tanks as Used Oil.
- Keep containers and tanks in good condition.
- Don't allow tanks to rust, leak, or deteriorate.
- Fix structural defects immediately.
- Never store used oil in anything other than tanks and storage containers.

Used oil may also be stored in units that are permitted to store regulated hazardous waste. Tanks and containers storing used oil do not need to be RCRA-permitted, however, as long as they are labeled and in good condition. Storage of used oil in lagoons, pits, or surface impoundments that are not permitted under RCRA is prohibited.

Collectors and transporters are required to have secondary containment on any of their storage tanks. Secondary containment is not required for generators, but it is highly recommended (you are responsible for spills at your facility).

Take steps to prevent leaks and spills. Keep machinery, equipment containers, and tanks in good working condition and be careful when transferring used oil. Have sorbent materials available on site.

If a spill or leak occurs, stop the oil from flowing at the source. If a leak from a container or tank can't be stopped, put the oil in another holding container or tank.

Next, contain any spilled oil. For example, containment can be accomplished by erecting sorbent berms or by spreading a sorbent over the oil and surrounding area. Clean up the oil and recycle the used oil as you would have before it was spilled. If recycling is not possible, you first must make sure the used oil is not a hazardous waste and dispose of it appropriately.

All used cleanup materials, from rags to sorbent booms, that contain free-flowing used oil also must be handled according to the used oil management standards. Remember, all leaked and spilled oil collected during cleanup must be handled as used oil.

The EPA does have licensing, identification, or recordkeeping requirements on used oil generators. The EPA regulations begin with the transporter. Transporters hauling used oil must have a valid EPA ID number, and generators, collection centers, and aggregation points must use transporters with EPA ID numbers for shipping used oil off site.

To sum this requirement up, tracking the used oil from "cradle to grave" is the transporter's job. As the "generator" you just have to be sure the company that is doing the transporting is a licensed transporter.

Generators, collection centers, aggregation points, and any handler that transports used oil in shipments of less than 55 gallons do not need an ID number, but may need a state or local permit. You can transport limited amounts of used oil yourself, up to one 55-gallon drum, to a central fleet location, if you want to do that.

Notes

Vehicle Maintenance Pro

Notes

So what do you do with the used oil that is produced as a byproduct of your maintenance operations? There are a couple of options for a maintenance pro to consider:

Use as heating oil — The technology involved in the space heaters which burn the used oil has made great strides toward clean and efficient performance. It may not be possible to completely heat a facility with used oil, but used oil can be used to supplement the primary heating system.

As was mentioned earlier, waste oil generators are allowed to burn used oil in space heaters provided they burn only their own used oil and used oil provided by household do-it-yourself generators, the waste oil is not contaminated, the space heater has a capacity of less than 500,000 BTUs per hour, and the combustion gases are correctly vented.

Arrange for recycling/disposal — No maintenance pro should let used oil leave the facility without knowing exactly where it's going and with whom. Particularly if your used oil falls in the hazardous waste column, you need to keep in mind the "cradle-to-grave" rule about hazardous waste and who's responsible for it.

Even with recycling vendors though, how do you know if the guy is reputable? You can make a personal visit to some vendors you consider to be possibilities, or you can go with a "brand-name" company you can check out easily, or you could join an industry cooperative group to take advantage of group expertise (WAG is an example — Waste Audit Group sponsored by the American Trucking Associations). At the very least, make sure the transporter involved with the recycling vendor has a valid EPA ID number.

Be aware of state variances — Generators, processors, transporters, and burners of used oil should keep in mind that individual states have the option of creating used oil regulations that are more stringent than the federal or that impose additional management controls. A review of pertinent state regulations is always suggested to insure your compliance with them, as well as the federal regulations. For example, California, Connecticut and New Jersey are among about 15 states that consider used oil a hazardous or special waste and consequently have additional used oil management standards.

In addition to EPA's used oil management standards, your business may be required to comply with federal and state hazardous waste regulations if your used oil becomes contaminated from mixing it with hazardous waste. If used oil is mixed with hazardous waste, it probably will have to be managed as a hazardous waste.

Refrigerants

EPA regulatory requirements have been put in place to try to keep refrigerant chemicals from being introduced into the atmosphere. Two of these are commonly used in vehicle cooling and refrigeration systems, CFC-12 and HCFC-134a. One of the largest uses of CFC-12 in the U.S. is as a refrigerant in motor vehicle air conditioners (MVACs).

Compliance Management

Section 609 of the Act gives EPA the authority to establish requirements to prevent the release of refrigerants during the servicing of MVACs and to require recycling of refrigerants. Widespread refrigerant recycling reduces the demand for virgin CFC-12 and thus extends the time that it will be available. The following sections describe the requirements of the law and its potential impact on the service facilities.

Recycling vs. Reclamation.In the discussion below, recycling means the use of a machine to remove impurities and oil and then recharge the refrigerant into either the same car or a different car. Recycled refrigerant is not as pure as reclaimed refrigerant. Recycling occurs in the service shop.

Reclamation means the removal of all oil and impurities beyond that provided by on-site recycling equipment, and reclaimed refrigerant is essentially identical to new, unused refrigerant. Reclamation cannot be performed in the service shop. Rather, the shop generally sends refrigerant back to either the manufacturer or directly to a reclamation facility.

CFC 12

Handling CFC-12 — CFC-12, also known as R-12 or freon, has been determined to be an ozone-depleting chemical and is being phased out.

Venting — Section 608 of the Clean Air Act prohibits releasing CFC-12 into the atmosphere. The prohibition on venting CFC-12 has been in effect since 1992.

Section 609 Regulatory History — The original regulation promulgated under section 609 was published in July 1992. That regulation established standards for equipment that recovers and recycles CFC-12 refrigerant from motor vehicle air conditioners, rules for training and testing technicians to handle this equipment, and recordkeeping requirements for service facilities and for refrigerant retailers.

A supplemental final rule published in May 1995 established a standard for equipment that recovers, but does not recycle CFC-12, and training and testing technicians to handle this equipment.

Approved equipment technicians repairing or servicing CFC-12 MVACs must use either recover/recycle or recover-only equipment approved by EPA. Recover/recycle equipment cleans the refrigerant so that oil, air, and moisture contaminants reach acceptably low levels.

Technician training and certification — Technicians who repair or service CFC-12 and HFC-134a motor vehicle air conditioners must be trained and certified by an EPA-approved organization. Training programs must include information on the proper use of equipment, the regulatory requirements, the importance of refrigerant recovery, and the effects of ozone depletion. To be certified, technicians must pass a test demonstrating their knowledge in these areas. A list of approved testing programs is available from the EPA Hotline and the EPA website.

Recordkeeping requirements — Service shops must maintain records of the name and address of any facility to which refrigerant is

Notes

Vehicle Maintenance Pro

Notes

sent. If refrigerant is recovered and sent to a reclamation facility, the name and address of that facility must be kept on file.

Service shops are also required to maintain records (on-site) showing that all service technicians are properly certified.

Certification requirements — Service shops must certify to EPA that they have acquired and are properly using approved refrigerant recovery equipment, and that each person using the equipment has been properly trained and certified. The certification statement shall include the name and address of the service establishment, the name of the equipment manufacturer, equipment model and serial number, and equipment date of manufacture. A sample certification form available at the EPA website shows the information that should be included in the signed statement.

Sales restrictions — Section 609 has long prohibited the sale of small cans of ozone-depleting refrigerants to anyone other than a certified technician. The sale of any size container of CFC-12 to anyone other than certified technicians was prohibited under section 608 of the Act beginning on November 14, 1994. This provision is intended to discourage “do-it-yourselfers” who recharge their own systems. Such individuals often release refrigerant because they typically do not have access to recovery/recycling equipment.

The EPA’s goal with the prohibition on public sale of CFC-12 is to encourage “do-it-yourselfers” to bring their cars and trucks to certified technicians who can properly fix air conditioners using approved equipment.

Retrofitting vehicles to alternative refrigerants — Although section 609 of the Act does not govern retrofitting, section 612 of the Act, which describes the Agency’s Significant New Alternatives Policy (SNAP) program, does require that when retrofitting a CFC-12 vehicle for use with another refrigerant, the technician must first extract the CFC-12, must cover the CFC-12 label with a label that indicates the new refrigerant in the system and other information, and must affix new fittings unique to that refrigerant.

In addition, if a technician is retrofitting a vehicle to a refrigerant that contains CFC-12, the technician must ensure that only barrier hoses are used in the A/C system. Finally, if the system includes a pressure-relief device, the technician must install a high-pressure compressor shutoff switch to prevent the compressor from increasing pressure until the refrigerant is vented.

HFC-134a

Handling HFC-134a — HFC-134a, also known as R-134a, is the most common replacement for CFC-12. It is still in production and available, but has some restrictions.

Venting — As is the case with CFC-12, section 608 of the Clean Air Act prohibits releasing HFC-134a refrigerant into the atmosphere. The prohibition on venting HFC-134a has been in effect since November 1995.

Section 609 Regulatory History — In March, 1996, EPA proposed a rule to require recycling of HFC-134a. The rule proposed standards for

Compliance Management

recover-only and recover/recycle equipment and rules for training and testing technicians to handle this equipment. EPA requested comments from the public about this proposed rule, and, after reviewing the comments, published a final rule on December 30, 1997. This final rule went into effect in 1998.

Technicians who repair or service HFC-134a MVACs must recover the refrigerant and either recycle it on-site, or send it off-site to a reclamation facility so that it may be purified according to ARI Standard 700. Technicians must use EPA-approved equipment to perform the refrigerant recovery and recycling. A list of approved recover/recycle and recover-only equipment is available from the Hotline and the EPA website.

Note that certain EPA-approved models can recycle both CFC-12 and HFC-134a refrigerants.

What about converting CFC-12 equipment for use with HFC-134a systems? EPA regulations prohibit technicians from changing fittings on the same unit back and forth so that the unit is used for CFC-12 in the morning, HFC-134a in the afternoon, then back to CFC-12 again, etc. The EPA regulations specify that when equipment is converted for use with a new refrigerant, the converted unit must be able to meet the applicable equipment standard set forth in the regulations for the refrigerant it is reclaiming or recycling.

The EPA intends to issue regulations placing certain restrictions on these retrofits in the future. Those restrictions may require that the manufacturer's service representative, rather than the automotive service technician, perform the retrofit, that a unit may only be retrofitted if retrofit procedures have been certified by an independent testing laboratory such as Underwriters Laboratories, and that an appropriate label is affixed to the unit.

In addition, the retrofitted unit must meet the technical specifications of SAE standard J2210 and must have the capacity to purify used refrigerant to SAE standard J2099 for safe and direct return to the air conditioner following repairs.

Currently, however, in the absence of any EPA regulations, a service facility may perform such a retrofit, or may have the equipment manufacturer's service representative perform the retrofit, as long as the fittings are changed in accordance with EPA's Significant New Alternative Policy (SNAP) program regulations.

The Agency cautions technicians, however, that even though recovering a given refrigerant using permanently-converted equipment is legal, it may not be technically desirable. The equipment is designed to be compatible with specific refrigerants, and incompatible materials may cause short circuits, damage to seals, and compressor failure.

Technicians should check with the recovery equipment manufacturer for recommendations about the recovery of refrigerants other than the refrigerant the equipment was originally intended to recover. Conversion of recovery equipment for use with other refrigerants may also invalidate any warranties offered by the equipment manufacturer.

Notes

Vehicle Maintenance Pro

Notes

Technician training and certification — Technicians who repair or service HFC-134a MVACs must be trained and certified by an EPA-approved organization. If a technician is already trained and certified to handle CFC-12, he/she does not need to be recertified to handle HFC-134a.

Recordkeeping requirements — Service shops must certify to EPA that they own approved HFC-134a equipment. Note that this certification is a one-time requirement, so that if a shop purchased a piece of CFC-12 recycling equipment in the past, and sent the certification to EPA, the shop does not need to send a second certification to EPA when it purchases a second piece of equipment, no matter what refrigerant that equipment is designed to handle.

If refrigerant is recovered and sent to a reclamation facility, the shop must retain the name and address of that reclaimer.

Sales restrictions — Right now, there is no restriction on the sale or purchase of HFC-134a, so anyone may purchase it.

Other refrigerants

Handling other refrigerants that substitute for CFC-12 — The EPA has issued a list of approved replacements for CFC-12 (provided below). Section 608 of the Clean Air Act prohibits venting any of the substitutes into the atmosphere. As with CFC-12 and HFC-134a, technicians working on MVAC systems containing these alternatives must have been trained in accordance with Section 609. If the technician has been trained on either CFC-12 or HFC 134a, the technician does not need to be retrained. Here is a list of the approved replacements:

Refrigerant Name	Date Approved	Manufacturer
HFC-134a	3/18/94	Several
FRIGC FR-12	6/13/95	Intercool Distribution
Free Zone/RB-276	5/22/96	Hi Tech Refrigerants, LLC
Ikon-12	5/22/96	Ikon Corp.
R-406A/GHG	10/16/96	People's Welding
GHG-HP	10/16/96	People's Welding
GHG-X4/Autofrost/Chill-It	10/16/96	People's Welding and McMullen Oil Products
Hot Shot/Kar Kool	10/16/96	ICOR
Freeze 12	10/16/96	Technical Chemical
GHG-X5	6/3/97	People's Welding
SP34E	12/18/00	Solpower
RS-24	12/20/02	Refrigerant Products Ltd
R-420A	3/29/06	RMS of Georgia

Using older equipment to recover blended refrigerants — Technicians have a number of choices in recovering new refrigerants. One option is that a technician may permanently dedicate an older piece of equipment the shop owns to recovering one or more blend refrigerants. The technician may also use this equipment to recover contaminated CFC-12 and HFC-134a and other “mystery mixtures.” This equipment,

Compliance Management

however, may not be used to recover uncontaminated CFC-12 or HFC-134a. Refrigerant recovered using this kind of “junk” tank must then be shipped off-site for reclamation or destruction.

Using new equipment to recover blends — Another option for recovering blended refrigerant is to use a new piece of EPA-approved equipment designed to recover, but not recycle, any single, specific refrigerant. The EPA regulation published in December 1997, includes an appendix that describes the standards that this new equipment must meet. In addition, EPA is currently working with independent testing laboratories and equipment manufacturers to devise a standard for new equipment that can recover, but not recycle, multiple refrigerants and contaminated CFC-12 and HFC-134a.

Equipment used for specific refrigerant — All of the EPA approved substitute refrigerants listed above have had equipment specifications assigned to them. These specifications include connection sizes and color coding. Here is a table showing the specifications:

Refrigerant	High Side Service Port			Low Side Service Port		
	Diameter (inches)	Pitch (threads/inch)	Thread Direction	Diameter (inches)	Pitch (threads/inch)	Thread Direction
CFC-12 (post-1987)	9/16"	24	Right	7/16"	20	Right

Notes

Vehicle Maintenance Pro

Notes

Recycling blends as of June 1, 1998 — The EPA allows recycling of refrigerant blends used in motor vehicle air conditioning systems (MVACs), provided that recycling equipment meets the Underwriters Laboratories (UL) requirements and the refrigerant is returned to the vehicle from which it was removed. The only exception is for fleets of vehicles with a common owner; recycled blend refrigerant may be moved among vehicles within such a fleet. EPA detailed this policy in a June 1, 1998 open letter to the industry.

Recover/recycle equipment for use with substitutes — EPA currently prohibits the conversion of existing CFC-12 or HFC-134a recycling equipment for either temporary or permanent use with a blend refrigerant, unless the equipment is used only to recover, but not to recycle, the specific refrigerant.

Recordkeeping Requirements — Service facilities that work on vehicles that use substitutes must certify to EPA that they own approved equipment designed to service these refrigerants. Note that this certification is a one-time requirement, so that if a shop purchased a piece of CFC-12 or HFC-134a recycling equipment in the past, and sent the certification to EPA, the shop does not need to send a second certification to EPA when it purchases a second piece of equipment, no matter what refrigerant that equipment is designed to handle.

If refrigerant is recovered and sent to a reclamation facility, the shop must retain the name and address of that reclaimer.

One final word on refrigerants. As of 2010 HCFC-22 (which is also referred to as R-22 or by one of its trade names, Freon® 22 and HCFC-142b) will begin to be phased out. Starting January 1, 2010, the production and import of HCFC-22 for newly manufactured equipment will stop in the United States. The production/import limit will be set at a level that is suitable for servicing existing equipment.

Between 2010 and 2020, HCFC-22 and HCFC-142b will be produced or imported for the exclusive purpose of servicing existing equipment.

As of January 1, 2015, as part of the phaseout of all HCFCs, the sale and use of HCFC-22 will be banned except for transformation or servicing refrigeration and air-conditioning applications. EPA will not permit newly manufactured HCFC-22 to be used for charging new equipment.

Starting January 1, 2020, the production and import of HCFC-22 will be banned entirely in the United States. Once this happens, only recycled/reclaimed or stockpiled quantities of HCFC-22 will be available for servicing existing equipment.

Used batteries

If you generate, collect, transport, store, or regenerate lead-acid batteries for reclamation purposes, you may be exempt from certain hazardous waste management requirements. Use the following table to determine which requirements apply to you. Alternatively, you may choose to manage your spent lead-acid batteries under the Universal Waste rule in 40 CFR Part 273.

Compliance Management

If your batteries * * *	And if you * * *	Then you * * *	And you * * *
(1) Will be reclaimed through regeneration (such as by electrolyte replacement).		are exempt from 40 CFR Parts 262 (except for §262.11), 263, 264, 265, 266, 268, 270, 124 of this chapter, and the notification requirements at section 3010 of RCRA.	are subject to 40 CFR Parts 261 and 262.11 of this chapter.
(2) Will be reclaimed other than through regeneration.	generate , collect, and/or transport these batteries.	are exempt from 40 CFR Parts 262 (except for §262.11), 63, 264, 265, 266, 270, 124 of this chapter, and the notification requirements at section 3010 of RCRA.	are subject to 40 CFR Parts 261 and 262.11, and applicable provisions under Part 268.
(3) Will be reclaimed other than through regeneration.	store these batteries but you aren't the reclaimer.	are exempt from 40 CFR Parts 262 (except for §262.11), 263, 264, 265, 266, 270, 124 of this chapter, and the notification requirements at section 3010 of RCRA.	are subject to 40 CFR Parts 261, 262.11, and applicable provisions under Part 268.
(4) Will be reclaimed other than through regeneration.	store these batteries before you reclaim them.	must comply with 40 CFR 266.80(b) and as appropriate other regulatory provisions described in 266.80(b).	are subject to 40 CFR Parts 261, 262.11, and applicable provisions under.
(5) Will be reclaimed other than through regeneration.	don't store these batteries before you reclaim them.	are exempt from 40 CFR Parts 262 (except for §262.11), 263, 264, 265, 266, 270, 124 of this chapter, and the notification requirements at section 3010 of RCRA.	are subject to 40 CFR 262 (except for §262.11) Parts 261, 262.11, and applicable provisions under Part 268.

Remember, you may not be able to treat lead-acid batteries as Universal Waste. This is because the electrolyte contained inside the battery will disallow classifying them as Universal Waste in some cases!

EPA regs specifically set out procedures for recycling lead-acid batteries. The batteries are only “green” as long as they stay in one piece from the time they leave your shop until they reach an approved recycler for breakdown in a safe environment.

“Junkers” will break up the batteries they buy with a sledge hammer and haul the lead plates to a smelter. Since the battery electrolyte contains sulfuric acid, in addition to the lead plates, you are obviously dealing with a hazardous waste if the battery is broken open before it reaches a proper recycling point.

Notes

Vehicle Maintenance Pro

Notes

If you risk using a “junker” you could be held responsible for his actions under Superfund “cradle-to-grave” waste legislation. A current horror story has 20 or more potentially responsible parties (PRPs) being held accountable for cleanup and legal fees attached to a Superfund site in Virginia, after a battery-breaking operation declared bankruptcy and disappeared when the operation was closed down by regulators in 1985. Research and business records helped identify the 20 PRPs who are now being held responsible for more than \$20 million. This case is only an example of what can happen to a fleet or shop manager caught in the web of an unscrupulous junker. Don’t let it happen to you.

Be sure your employees know how to handle batteries correctly, along with storing them. If you are careful, you can avoid most breakage and acid spills. Keep these tips in mind:

- Store batteries right-side up, preferably on a skid so they are raised off the ground and away from potential damage by water, rain, etc.
- Store batteries in a dry area away from any source of flame or spark.
- Don’t try to move batteries alone — they should be lifted by two people, using a carrier.
- Don’t put excess pressure on the ends of a lead-acid battery.
- Always use PPE that will protect from the effects of the acid.

The best practice with used batteries is to establish a recycling system with a reputable supplier or recycler. This keeps them classified as Universal Waste and avoids many of the problems associated with the disposal of batteries.

Underground storage tanks

Not all UST systems are federally regulated, although they may be regulated by the state or local agency that implements an UST program, and you should first check with them.

A federally-regulated UST is defined as “any one or combination of tanks (including underground pipes connected thereto) that is used to contain an accumulation of regulated substances, and the volume of which (including underground pipes connected thereto) is 10 percent or more beneath the surface of the ground.” Federally-regulated USTs meet one or more of the following criteria:

- Have a capacity of more than 110 gallons.
- Contain regulated substances as defined as hazardous under the Comprehensive Environmental Response, Compensation, and Liability Act (with exceptions).
- Do not contain hazardous wastes regulated (i.e., listed or identified) under Subtitle C of the Solid Waste Disposal Act or a mixture of such hazardous waste and another regulated substance.

Compliance Management

- Are not part of a wastewater treatment system that is part of a wastewater treatment facility regulated under Section 402 or 307(b) of the Clean Water Act.

Under 40 CFR Part 280.11, the following groups of tanks are not included in the definition of an UST:

- Farm or residential tanks of 1,100 gallons or less capacity used for storing motor fuel for noncommercial purposes.
- Tanks used for storing heating oil for consumptive use on the premises where stored.
- Septic tanks.
- Tank systems in pipeline facilities (including gathering lines) regulated under the Natural Gas Pipeline Safety Act of 1968 (49 U.S.C. App. 1671 et seq.), the Hazardous Liquid Pipeline Safety Act of 1979 (49 U.S.C. App. 2001, et seq.), or in an intrastate pipeline facility regulated under State laws comparable to the provisions of law referred to in the two previous clauses.
- Surface impoundments, pits, ponds, or lagoons.
- Storm water or wastewater collection systems.
- Flow-through process tanks.
- Liquid trap or associated gathering lines directly related to oil or gas production and gathering operations.
- Tanks in underground areas such as basements, cellars, and mineworking drifts, shafts or tunnels, if they are located on or above the surface of the floor.

You should refer to 40 CFR Part 280 for a complete definition. For general questions about the federal UST program, you can contact EPA's RCRA, Superfund, and EPCRA Hotline at (800) 424-9346.

Requirements for USTs installed after December 22, 1988

The following requirements apply to USTs installed after December 22, 1988:

- The tank and piping must be certified as being properly installed according to industry codes.
- The tank must be equipped with spill and overfill prevention equipment.
- Correct tank filling practices must be followed.
- The tank and piping must be protected from corrosion.
- The tank and piping must be equipped with leak detection.

Notes

Vehicle Maintenance Pro

Notes

Requirements for USTs installed before December 22, 1988

USTs installed before December 22, 1988, must comply with the following by December 1998:

- Steel USTs and piping must have corrosion protection; and
- USTs must have spill and overfill prevention equipment.

USTs that are not upgraded to meet the new UST requirements must be removed from service.

Requirements on USTs and UST operators as a result of the Energy Policy of 2005

On August 8, 2005, President Bush signed the Energy Policy Act of 2005. Title XV, Subtitle B of this act (entitled the Underground Storage Tank Compliance Act) contains amendments to Subtitle I of the Solid Waste Disposal Act — the original legislation that created the underground storage tank (UST) program. This new law significantly affects federal and state underground storage tank programs, will require major changes to the programs, and is aimed at reducing underground storage tank releases to our environment.

The underground storage tank provisions of the Energy Policy Act focus on preventing releases. Among other things, it expands eligible uses of the Leaking Underground Storage Tank (LUST) Trust Fund and includes provisions regarding inspections, operator training, delivery prohibition, secondary containment and financial responsibility, and cleanup of releases that contain oxygenated fuel additives.

Leaking USTs

40 Part CFR 280 describes the response required upon discovering that an UST is leaking. In general, an UST owner or operator is required to perform the following:

- Immediately mitigate fire and explosion hazards by containing the leak or spill;
- Within 24 hours, report the release to the appropriate regulatory authority;
- Determine the extent of soil or groundwater contamination present;
- Within 20 days of discovering the release, report cleanup progress to the appropriate regulatory authority;
- Perform a full-site investigation to determine whether the release has impacted the environment;
- Develop a plan for removing the released substance from the groundwater, if applicable; and
- Within 45 days of discovering the release, report the results of the site investigation and the plan for remediating groundwater to the appropriate regulatory authority.

Compliance Management

Depending upon the results of the site investigation, further remediation, monitoring, or reporting may be required by the regulatory authority.

Closing USTs

USTs may be closed temporarily or permanently. Temporary closure of an UST is required for USTs that are not used for 3 to 12 months. An UST may be permanently closed by either removing the UST from the ground or by filling the UST in the ground with an inert solid material such as sand.

Notification forms

On November 8, 1985, EPA published a notification form to be used to provide information about underground storage tanks. This form can be found in Appendix I to Section 280.

However, the regulation specifies that designated state or local agencies, not EPA, receive the notification. EPA has provided in Part 280, Appendix II a list of these agencies. Owners of underground storage tanks are advised to consult this list to determine:

1. To whom the notification must be sent, and
2. Whether the state in which the underground tank is located requires the use of the EPA form or an alternate state form for notification purposes.

Notification requirements

On or before May 8, 1986, every owner of an underground storage tank was required to submit notice of the existence of the tank to the appropriate agency.

Tanks taken out of service after January 1, 1974, must have a notice sent by May 8, 1986 (unless the tank has been removed from the ground).

Any owner who brings into use an underground tank after May 8, 1986, has 30 days to submit a notice of the tank's existence.

To ensure that the UST requirements become as widely known as possible, there is a non-owner obligation. After October 24, 1988, any person who sells a UST must notify the purchaser of the owner's notification obligations under this regulation. The form provided in Part 280, Appendix III may be used to comply with this requirement.

Interim prohibitions for deferred UST systems

No underground storage tanks under deferral (wastewater treatment systems, holding radioactive material, etc.) may be installed for the purpose of storing regulated substances unless such tank:

1. Will prevent releases due to corrosion or structural failure for the life of the tank.

Notes

Vehicle Maintenance Pro

Notes

2. Is designed to prevent the release of any stored substance (e.g., is cathodically protected, constructed of noncorrosive material, or steel clad with a noncorrosive material).

3. The material used in the construction or lining of the tank is compatible with the substance to be stored.

Performance standards for new UST systems

In order to prevent releases due to structural failure, corrosion, or spills and overfills, new UST systems must meet the following requirements.

Tanks: Each tank must be properly designed and constructed, and meet national standards in one of the following construction methods.

1. Fiberglass-reinforced plastic.
2. Steel construction and cathodically protected.
3. Steel-fiberglass-reinforced-plastic composite.
4. Metal without additional corrosion protection measures, when feasible.

Pipings: Similar to tanks, pipings must be properly designed and constructed, and meet national standards, using one of the following methods of construction.

1. Fiberglass-reinforced plastic.
2. Steel construction and cathodically protected.
3. Metal without additional corrosion protection measures, when feasible.

Spill and overfill prevention equipment: Equipment must be used that will prevent spilling and overfilling when a product is transferred to the UST system. Alternatives to this may be used if they can be shown to be as effective at protecting human health and the environment.

All tanks and pipings must be properly installed. Owners/operators must ensure that one of the six methods of certification, testing, or inspection (found in Section 280.20(e)) is used to demonstrate compliance by providing a certificate of compliance on the UST notification form.

Release detection

Owners and operators of new and existing UST systems must provide a method of release detection that:

1. Can detect a release from any portion of the tank and the connected underground piping that routinely contains product.
2. Is installed, calibrated, operated, and maintained in accordance with the manufacturer's instructions, including routine maintenance and service checks for operability or running condition.
3. Meets the established performance requirements with any performance claims and their manner of determination described in writing by the equipment manufacturer or installer.

Compliance Management

When a release detection method operated in accordance with the performance standards indicates a release may have occurred, owners and operators must notify the implementing agency.

Any existing UST system that cannot apply a method of release detection that complies with these requirements must complete the closure procedures by the date on which release detection is required for that UST system.

Financial responsibility for petroleum USTs

EPA's financial responsibility rule for petroleum USTs became effective January 24, 1989 except for certain specified petroleum UST owners/operators. All petroleum marketing firms owning 1-12 USTs at more than one facility or fewer than 100 USTs at a single facility, and non-marketers with net worth of less than \$20 million have until December 31, 1993, according to the EPA final rule. That is a year after the date by which local governments must be in compliance. More than 40 states have already created assurance funds to help UST owners, according to the EPA. For information on the final rule and financial responsibility call the EPA/RCRA/Superfund Hotline at 800-424-9348. These financial responsibility requirements are applicable to owners or operators of "petroleum UST systems" with the following exceptions:

- Federal or state entities that own or operate USTs containing petroleum.
- Owners and operators of USTs excluded from the technical standards.

All owners or operators must maintain an annual aggregate of \$1 million or \$2 million depending on the number of USTs owned or operated.

In order to cover costs of corrective action and third party liability, all owners and operators of USTs must obtain financial assurance in the following amounts.

\$1,000,000 per occurrence for facilities:

- that produce, refine or market petroleum; and
- whose USTs have an average monthly throughput of 10,000 gallons.

\$500,000 per occurrence for facilities:

- that do not produce, refine or market petroleum; and
- whose USTs have an average monthly throughput of less than 10,000 gallons.

UST owners or operators may satisfy the requirements using the following mechanisms: insurance or risk retention group coverage, surety bond, guarantee, letter of credit, financial test of self-insurance, trust fund, a state-required mechanism, or a state fund or other state assurance.

Aboveground storage tanks

What about aboveground storage?

An aboveground storage tank (AST) is a tank whose entire surface area is completely aboveground. Also, the entire surface area of the tank (including the tank bottom) can be visually inspected (40 CFR §260.10). An underground storage tank (UST), on the other hand, is a “tank” whose entire surface area is totally below the surface of and covered by the ground (40 CFR §260.10).

A “tank” is a stationary device which is constructed primarily of non-earthen materials (e.g., wood, concrete, steel, plastic) which provide structural support (40 CFR §260.10).

Replacing underground storage tanks with aboveground storage is one option that some fleets are taking, but it is not an automatic cure-all for the environmental problems attached to USTs. You may just be trading one set of problems for another. What kind of environmental risk can be posed by aboveground storage tank systems (ASTs)?

Federal AST requirements under 40 CFR Part 112

All ASTs should have a secondary containment area that contains spills and allows leaks to be more easily detected. The containment area surrounding the tank should hold 110 percent of the contents of the largest tank plus freeboard for precipitation. Secondary containment for ASTs must be impermeable to the materials being stored. Methods include berms, dikes, liners, vaults, and double-walled tanks. A manually controlled sump pump should be used to collect rain water that may accumulate in the secondary containment area. Any discharge should be inspected for petroleum or chemicals prior to being dispensed.

Routinely monitor ASTs to ensure they are not leaking. An audit of a newly-installed tank system by a professional engineer can identify and correct problems such as loose fittings, poor welding, and poorly-fit gaskets. After installation, inspect the tank system periodically to ensure it is in good condition. Depending on the permeability of the secondary containment area, more frequent containment area checks may be necessary. Areas to inspect include tank foundations, connections, coatings, tank walls, and the piping system. Integrity testing should be done periodically by a qualified professional and in accordance to applicable standards. Another method is tracking gallons removed from the tank, checking tank outage to determine how much is in the tanks, and tracking filling. This accounting system can be set up by a professional engineer familiar with the tank.

If an AST has remained out of service for a year or more, many States require owners to continue to maintain and monitor the tank, declare the tank inactive, or remove it. If the tank is declared inactive, remove all substances from the AST system (including pipes) and completely clean the inside. Secure tanks by bolting and locking all valves, as well as capping all gauge openings and fill lines. Clearly label tanks with the date and the words “Out of Service.” Samples may be required when removing tanks to determine if any contamination has occurred. Most

Compliance Management

States require out-of-service tanks to be inspected and meet leak detection requirements before they are put back into service.

Additional AST prevention measures

The following prevention measures go beyond the Federal regulations under 40 CFR Part 112, but are highly recommended.

The location of the facility must be considered in relation to drinking water wells, streams, ponds and ditches (perennial or intermittent), storm or sanitary sewers, wetlands, mudflats, sandflats, farm drain tiles, or other navigable waters. The distance to drinking water wells and surface water, volume of material stored, worst-case weather conditions, drainage patterns, land contours, and soil conditions must also be taken into account.

ASTs should have corrosion protection for the tank. Options include elevating tanks, resting tanks on continuous concrete slabs, installing double-walled tanks, cathodically protecting the tanks, internally lining tanks, inspecting tanks according to American Petroleum Institute standard, or a combination of the options listed above. All underground piping to the tank should be double-walled or located above ground or cathodically protected so you can inspect it when it fails.

To maximize system safety, seal the floors, containment area, and sump pump pit with an appropriate coating (e.g., petroleum-resistant coating). Any accumulated water should be inspected for petroleum or chemicals prior to discharge

Accumulated minor spillage, over time, may result in a film or sheen on collected rain water, making it unsuitable for discharge to the soil or drains. Periodic cleanup of the containment areas (e.g., sweeping with a broom and using limited absorbent) can prevent unnecessary dirt and contaminant buildup.

While not a preventative measure for source-water protection, preventing evaporation has economic and air-quality benefits. To keep out rain and reduce evaporation losses and moisture condensation, paint tanks a reflective color, install them in an east-west direction, install a low-pressure valve on top of the tank, and cover the structure. A roof structure covering a 10,000 gallon tank will conserve 600 to 1,000 gallons of gasoline per year, which would have escaped by evaporation without the shade cover.

Some potential problems with ASTs are:

- spillage,
- failure of tank bottoms,
- ground surface contamination, and
- ground water contamination because of migration from the tanks.

Concerning the storage of hazardous waste in ASTs, you must look in the hazardous waste regulations (Parts 260 through 268) to determine what is required. Parts 262, 264 and 265 of the Resource Conservation and

Notes

Vehicle Maintenance Pro

Notes

Recovery Act (RCRA), Subtitle C, also impact ASTs as these requirements apply to hazardous waste generators and treatment, storage, and disposal facilities.

Some ASTs fall under OSHA requirements (29 CFR §1910.106) if they contain flammable or combustible liquids. The rules apply to liquids with flashpoints below 200°F. In this case, the objective of the regulations is to protect workers from fires, rather than protecting the environment from spills.

Be aware, the majority of regulations affecting ASTs are found at the state and local level.

Check with your state and local agencies to see if there are more stringent AST requirements that you need to know about.

Still interested?

If you are considering a move to an AST, keep these considerations in mind: cost (be sure to include any required secondary containment), deliveries (because an AST requires a pumping system, there could be more system problems), climate conditions (ASTs are more susceptible to extremes of heat and cold), safety (ASTs are more likely to catch fire), space availability and accessibility (remember to figure in sufficient space for the tank and all the secondary containment equipment, as well as piping), aesthetics and security (be sure to consider how the tank is going to look in the community — it does make a difference in how it's accepted).

Spill Prevention, Control and Countermeasure Plan

If you store oil you may be regulated under the Spill Prevention, Control and Countermeasure (SPCC) regulations contained in 40 CFR Part 112. The SPCC regulations establish procedures to prevent the discharge of oil into navigable waters.

Any entity that stores more than 42,000 gallons in a below-ground tank, and more than 1,320 gallons in an aboveground storage tank, and that is in a location where a spill may affect a navigable water, is subject to this requirement.

The SPCC Plan rule includes requirements for oil spill prevention, preparedness, and response to prevent oil discharges to navigable waters and adjoining shorelines. The rule requires specific facilities to prepare, amend, and implement SPCC Plans.

The SPCC plan must detail the equipment, workforce, procedures, and steps to prevent, control, and provide adequate countermeasures to a discharge.

Compliance Management

Wastewater

Clean Water Act and NPDES

Water pollution degrades surface waters making them unsafe for drinking, fishing, swimming, and other activities. As authorized by the Clean Water Act, the National Pollutant Discharge Elimination System (NPDES) permit program controls water pollution by regulating point sources that discharge pollutants into waters of the United States. Point sources are discrete conveyances such as pipes or man-made ditches. Individual homes that are connected to a municipal system, use a septic system, or do not have a surface discharge do not need an NPDES permit; however, industrial, municipal, and other facilities must obtain permits if their discharges go directly to surface waters. In most cases, the NPDES permit program is administered by authorized states. Since its introduction in 1972, the NPDES permit program is responsible for significant improvements to our Nation's water quality.

Wastewater discharges from industrial sources may contain pollutants at levels that could affect the quality of receiving waters. The NPDES permit program establishes specific requirements for discharges from industrial sources. Depending on the type of industrial or commercial facility you operate, more than one NPDES program may apply. For example, the stormwater that runs off from the property of an industrial facility or from a construction site may require a NPDES permit under the stormwater program. An industrial facility may also discharge wastewater to a municipal sewer system and be covered under the NPDES pretreatment program. The industrial facility may also discharge wastewater directly to a surface water and require an individual or general NPDES permit. Finally, many industrial facilities, whether they discharge directly to surface water or to a municipal sewer system, are covered by effluent limitation guidelines and standards.

Pretreatment program

Publicly-owned treatment works (POTWs) collect wastewater from homes, commercial buildings, and industrial facilities and transport it via a series of pipes, known as a collection system, to the treatment plant. Here, the POTW removes harmful organisms and other contaminants from the sewage so it can be discharged safely into the receiving stream. Generally, POTWs are designed to treat domestic sewage only.

However, POTWs also receive wastewater from nonresidential users. The General Pretreatment Regulations establish responsibilities of Federal, State, and local government, industry and the public to implement Pretreatment Standards to control pollutants from the industrial users (IUs) which may pass through or interfere with POTW treatment processes or which may contaminate sewage sludge.

All IUs, whether or not subject to any other National, State, or local pretreatment requirements, are subject to the general and specific prohibitions identified in 40 CFR §§403.5(a) and (b), respectively (the Pretreatment Regulations).

Notes

Vehicle Maintenance Pro

Notes

Basically, IUs are responsible for the prevention of indirect discharge of pollutants (so called because the discharge of pollutants is into a POTW, not directly in the water stream).

The National Pretreatment Program is charged with controlling 126 specific Priority Pollutants. These pollutants are restricted from discharge into sewer systems. Here is a list of these pollutants:

001 Acenaphthene	067 Butyl benzyl phthalate
002 Acrolein	068 Di-N-Butyl Phthalate
003 Acrylonitrile	069 Di-n-octyl phthalate
004 Benzene	070 Diethyl Phthalate
005 Benzidine	071 Dimethyl phthalate
006 Carbon tetrachloride	072 benzo(a) anthracene
007 Chlorobenzene	073 Benzo(a)pyrene
008 1,2,4-trichlorobenzene	074 Benzo(b) fluoranthene
009 Hexachlorobenzene	075 Benzo(b) fluoranthene
010 1,2-dichloroethane	076 Chrysene
011 1,1,1-trichloroethane	077 Acenaphthylene
012 Hexachloroethane	078 Anthracene
013 1,1-dichloroethane	079 Benzo(ghi) perylene
014 1,1,2-trichloroethane	080 Fluorene
015 1,1,2,2-tetrachloroethane	081 Phenanthrene
016 Chloroethane	082 Dibenzo(h) anthracene
018 Bis(2-chloroethyl) ether	083 Indeno (1,2,3-cd) pyrene
019 2-chloroethyl vinyl ethers	084 Pyrene
020 2-chloronaphthalene	085 Tetrachloroethylene
021 2,4,6-trichlorophenol	086 Toluene
022 Parachlorometa cresol	087 Trichloroethylene
023 Chloroform	088 Vinyl chloride
024 2-chlorophenol	089 Aldrin
025 1,2-dichlorobenzene	090 Dieldrin
026 1,3-dichlorobenzene	091 Chlordane
027 1,4-dichlorobenzene	092 4,4-DDT
028 3,3-dichlorobenzidine	093 4,4-DDE
029 1,1-dichloroethylene	094 4,4-DDD
030 1,2-trans-dichloroethylene	095 Alpha-endosulfan
031 2,4-dichlorophenol	096 Beta-endosulfan
032 1,2-dichloropropane	097 Endosulfan sulfate
033 1,2-dichloropropylene	098 Endrin
034 2,4-dimethylphenol	099 Endrin aldehyde
035 2,4-dinitrotoluene	100 Heptachlor
036 2,6-dinitrotoluene	101 Heptachlor epoxide
037 1,2-diphenylhydrazine	102 Alpha-BHC
038 Ethylbenzene	103 Beta-BHC
039 Fluoranthene	104 Gamma-BHC
040 4-chlorophenyl phenyl ether	105 Delta-BHC
041 4-bromophenyl phenyl ether	106 PCB-1242
042 Bis(2-chloroisopropyl) ether	107 PCB-1254
043 Bis(2-chloroethoxy) methane	108 PCB-1221
044 Methylene chloride	109 PCB-1232
045 Methyl chloride	110 PCB-1248
046 Methyl bromide	111 PCB-1260
047 Bromoform	112 PCB-1016
048 Dichlorobromomethane	113 Toxaphene

Compliance Management

051 Chlorodibromomethane	114 Antimony
052 Hexachlorobutadiene	115 Arsenic
053 Hexachlorocyclopentadiene	116 Asbestos
054 Isophorone	117 Beryllium
055 Naphthalene	118 Cadmium
056 Nitrobenzene	119 Chromium
057 2-nitrophenol	120 Copper
058 4-nitrophenol	121 Cyanide, Total
059 2,4-dinitrophenol	122 Lead
060 4,6-dinitro-o-cresol	123 Mercury
061 N-nitrosodimethylamine	124 Nickel
062 N-nitrosodiphenylamine	125 Selenium
063 N-nitrosodi-n-propylamine	126 Silver
064 Pentachlorophenol	127 Thallium
065 Phenol	128 Zinc
066 Bis(2-ethylhexyl) phthalate	129 2,3,7,8-TCDD

As well as regulating these 126 pollutants, the Pretreatment program also protects POTW from materials that may pass through, interfere with the operation of, or damage the POTW or the collection system (sewer piping). This is referred to as the general Pretreatment Requirement.

General prohibitions forbid IUs from discharging any pollutant to a POTW that causes pass-through of a toxin or interferes with the function of the POTW. Specific prohibitions forbid eight categories of pollutant discharges as follows:

- Discharges containing pollutants which create a fire or explosion hazard in the POTW, including but not limited to, wastestreams with a closed-cup flashpoint of less than 140°F (60°C) using the test methods specified in 40 CFR §261.21.
- Discharges containing pollutants causing corrosive structural damage to the POTW, but in no case discharges with a pH lower than 5.0, unless the POTW is specifically designed to accommodate such discharges.
- Discharges containing pollutants in amounts causing obstruction to the flow in the POTW resulting in interference.
- Discharges of any pollutants released at a flow rate and/or concentration which will cause interference with the POTW.
- Discharges of heat in amounts which will inhibit biological activity in the POTW resulting in interference, but in no case heat in such quantities that the temperature at the POTW treatment plant exceeds 40°C (104°F) unless the Approval Authority, upon request of the POTW, approves alternative temperature limits.
- Discharges of petroleum oil, nonbiodegradable cutting oil, or products of mineral oil origin in amounts that will cause interference or pass-through.

Notes

Vehicle Maintenance Pro

Notes

- Discharges which result in the presence of toxic gases, vapors, or fumes within the POTW in a quantity that may cause acute worker health and safety problems.
- Discharges of trucked or hauled pollutants, except at discharge points designated by the POTW.

These prohibited discharge standards are intended to provide general protection for POTWs and the water stream in the area. However, their lack of specific pollutant limitations creates the need for additional controls, namely categorical pretreatment standards and local limits.

Category (CIU) pretreatment standard

Industries identified as major sources of toxic pollutants are typically targeted for effluent guideline and categorical standard development. IUs that are in one of 51 categories that are referred to as “category industrial users,” or CIUs, and are subject to more stringent permitting and pretreatment procedures than regular IUs.

Categorical pretreatment standards (i.e., categorical standards) are national, uniform, technology-based standards that apply to discharges to POTWs from CIUs and limit the indirect discharge of specific pollutants.

Effluent limitations guidelines (ELGs) are similar and are discussed later. The ELGs were developed in conjunction with categorical standards to limit the discharge of pollutants from facilities that discharge directly to waters of the U.S. (i.e., direct dischargers) as well as to POTWs.

SIUs

IUs that have a significant output (an IU that discharges an average of 25,000 gallons per day or more; an IU that contributes 5 percent or more of the average input of the POTW treatment plant; an IU designated by the Control Authority as such because of its reasonable potential to adversely affect the POTW’s operation or violate any pretreatment standard or requirement; or an IU subject to Federal categorical pretreatment standards) are referred to as significant industrial users (SIUs).

SIUs are not the same as CIUs (the CIU standards are based on industry, not volume) but they also have more stringent permitting and pretreatment requirements than the normal IUs.

Effluent limitations guidelines (ELGs)

ELGs not only dictate the indirect discharge of wastewater into a POTW (the pretreatment program and permits), but also mandate standards for the direct discharge of wastewater. If an industrial facility will be discharging wastewater from its facility directly into the waters of the U.S., the discharge must meet the ELGs.

Any facility that is going to directly discharge any wastewater must meet the ELG for the industry. The only segment of the transportation industry identified in the ELGs is the transport washout industry. Facilities

Compliance Management

that are involved in washing out tank vehicles are subject to the ELG regulations.

Groundwater protection

Septic systems are commonly found in rural and suburban areas where populations also rely on ground water for drinking water. Many septic systems are located in close proximity to private drinking water wells or public water systems that use ground water sources. When septic systems are properly sited, designed, constructed, and operated, they pose a minimal threat to drinking water sources. Alternatively, poorly designed, maintained, and operated septic systems can contaminate ground water and surface water with nutrients, toxic chemicals, and pathogens.

Septic systems are designed solely to treat domestic sanitary waste. The disposal of industrial or commercial waste into a septic system can seriously inhibit wastewater treatment and cause the system to fail. More important, chemicals can pass through the system, enter the ground water, and pose a serious contamination threat.

EPA is directed by the Safe Drinking Water Act (SDWA) to establish minimum federal requirements for state and tribal Underground Injection Control (UIC) Programs to protect underground sources of drinking water from contamination caused by underground injection activities. Protection includes the oversight of construction, operation, and closure of injection wells. A septic system is required to meet UIC Program requirements and is considered a Class V injection well if either one of the following conditions is met:

- The septic system, regardless of size, receives any amount of industrial or commercial wastewater (also known as industrial waste disposal wells or motor vehicle waste disposal wells); or
- The septic system receives solely sanitary waste from multiple-family residences or a non-residential establishment and has the capacity to serve 20 or more persons per day (also known as large-capacity septic systems).

Owners or operators of industrial waste disposal wells and large-capacity septic systems must meet state and federal requirements. The minimum federal requirements for Class V injection wells are:

- Obey the non-endangerment performance standard prohibiting injection that allows the movement of fluids containing *any* contaminant into underground sources of drinking water, and
- Provide inventory information (including facility name and location, legal contact name and address, ownership information, nature and type of injection wells, and operating status of the injection wells) to the state or EPA regional UIC Program.

A motor vehicle waste disposal well (MVWD) is a shallow disposal system that receives fluids from vehicle repair or maintenance activities in motor vehicle repair shops. MVWD wells are regulated as Class V injection wells (the same as septic systems).

Typical MVWD wells are connected to floor drains or sinks in service bays and can be a septic system or drywell. However, any underground

Notes

Vehicle Maintenance Pro

Notes

system that receives motor vehicle waste is considered to be a motor vehicle waste disposal well. For example, cesspools, catchbasins, and sink holes are considered MVWD wells if they receive motor vehicle waste.

During normal vehicle repair and maintenance, fluids such as engine oil or solvents may drip or spill into floor drains or sinks in service areas. Motor vehicle wastes include engine oil, transmission fluid, power steering fluid, brake fluid, antifreeze, solvents, and degreasers. If you dispose of these fluids through a MVWD well, they may contaminate ground water. Therefore, EPA regulates these wells to prevent ground water contamination.

In 1999, EPA published the Class V rule, which requires owners and operators of MVWD wells to meet the following additional requirements:

- New MVWD wells are banned as of April 2000. Therefore, motor vehicle maintenance and repair facilities can no longer construct or install wastewater disposal devices that allow service wastewater to enter sinks and floor drains connected to septic systems.
- Existing wells in regulated areas are banned and are required to be closed by January 2007 if they are in a sensitive ground water area. States and EPA regions may allow some MVWD wells to continue operating under a UIC permit or, in limited cases, to allow the owner to convert them to another type of well. Contact the appropriate EPA regional or state UIC Program to determine what areas are regulated in your state.

Any MVWD well that is allowed to keep functioning must meet:

- maximum contaminant levels (MCL) and other health-based standards at point of injection,
- best management practices must be specified, and
- monitoring requirements specified to characterize the quality of the injectate and sludge, both initially and on an ongoing basis.

States are typically the governmental body (normally the Department of Environmental Quality or the state's equivalent) given enforcement powers over Class V wells. At the minimum, states require that all Class V injection wells be listed in the state inventory through a UIC permitting system. Once the well is added to the state inventory the operator may be required to meet additional requirements (sampling, additional permitting requirements, sanitary permit renewals, etc.).

One alternative to discharging shop wastewater to a Class V system or a MVWD is going to a dry shop. Minimize the use of water to clean service bays. Use absorbents and vacuums to pick up spills and drips rather than washing down. Dispose of these materials as solid wastes according to state guidelines and regulations. Place all used vehicle fluids in individual containers for proper off-site management.

Another alternative is the use of holding tanks. Store the motor vehicle waste in a service bay wastewater holding tank. The tank can be periodically pumped out for proper disposal. You may minimize the amount

Compliance Management

of wastewater that has to be stored by separating shop wastewater from sanitary and vehicle washing wastewater and by cutting back on the amount of water used in your shop.

Contacting the local sewer authority about the possibility of connecting floor drains to the sewer system is another possibility. Often, system hook-up may be available even though it was not an option when the service bays were built. Sewer hookups can be expensive, however, and you may have to pre-treat wastewater coming out of the shop. If connecting to a sanitary sewer will take time to complete, you may be able to extend the deadline for closing your well for up to one year. However, you must get special permission to do this, and you probably will need a temporary operating permit.

Conversion is also an option. In some cases, you may be allowed to convert a motor vehicle waste disposal well to another type of Class V well or pre-treat to convert the wastewater. This option requires that all motor vehicle fluids be kept away from the normal drains using physical barriers that prevent the waste from entering the normal septic system or the old MVWD well.

Stormwater

Stormwater discharge from industrial facilities

Activities that take place at industrial facilities, such as material handling and storage, are often exposed to the weather. As runoff from rain or snowmelt comes into contact with these materials, it picks up pollutants and transports them to nearby storm sewer systems, rivers, lakes, or coastal waters. Stormwater pollution is a significant source of water quality problems for the nation's waters. Of the 11 pollution source categories listed in EPA's *National Water Quality Inventory: 2000 Report to Congress*, urban runoff/storm sewers was ranked as the fourth leading source of impairment in rivers, third in lakes, and second in estuaries.

In order to minimize the impact of stormwater discharges from industrial facilities, the NPDES program includes an industrial stormwater permitting component. Operators of industrial facilities included in one of the 11 categories of stormwater discharges associated with industrial activity that discharge or have the potential to discharge stormwater to a municipal separate storm sewer system (MS4) or directly to waters of the United States require authorization under a NPDES industrial stormwater permit. (Construction activity is one of these 11 categories, but because of the nature of its operations, it's discussed separately from the other 10 categories.)

Most states are authorized to implement the Stormwater NPDES permitting program. EPA remains the permitting authority in a few states, territories, and on most land in Indian country.

Notes

Vehicle Maintenance Pro

Notes

On December 1, 2005, EPA proposed an NPDES Stormwater Multi-Sector General Permit for Industrial Activities (MSGP). This proposed permit will replace the MSGP-2000 that expired on October 30, 2005. EPA asked for comments on the proposed permit and accompanying fact sheet. The comment period closed on February 16, 2006. Please note: EPA is continuing to work on a final MSGP and plans to reissue it in the near future. The reissued MSGP will be announced widely.

Most states have been authorized to implement the NPDES stormwater program. The stormwater programs are normally administered by the state's Department of Environmental Quality (or the equivalent). The EPA Construction General Permit and Multi-Sector General Permit apply only in areas where EPA is the permitting authority. This information can also be found in Appendix B of the CGP and Part 1 of the MSGP-2000.

The MSGP-2000 (or the state equivalent form) covers 30 industrial sectors that fall into one or more of the 11 categories of stormwater discharges associated with industrial activity described in 40 CFR §122.26(b)(14)(i)-(xi). The 30 categories are listed below and are defined by either the facility's Standard Industrial Classification (SIC) code or a general description of the facility's industrial activities. The North American Industry Classification System (NAICS) will eventually replace the SIC system. The U.S. Census Bureau has a conversion table to bridge the two systems.

Operators of industrial facilities or sites with activities included in one of these 11 categories must obtain coverage under a NPDES industrial stormwater permit, unless conditionally excluded. The list provided below describes the types of industrial activities within each category.

- Category One (i): Facilities with effluent limitations
- Category Two (ii): Manufacturing
- Category Three (iii): Mineral, Metal, Oil and Gas
- Category Four (iv): Hazardous Waste, Treatment, or Disposal Facilities
- Category Five (v): Landfills
- Category Six (vi): Recycling Facilities
- Category Seven (vii): Steam Electric Plants
- **Category Eight (viii): Transportation Facilities**
- Category Nine (ix): Treatment Works
- Category Ten (x): Construction Activity
- Category Eleven (xi): Light Industrial Activity

Compliance Management

PM PLAYS MAJOR ROLE IN STORM WATER RUNOFF PROTECTION — Your preventive maintenance approach should play a major role in the stormwater runoff prevention plan your facility may be required to develop if it classifies as an “industrial facility” in EPA’s eyes. The whole plan requires companies to develop storm water pollution prevention plans that cover:

- preventive maintenance,
- spill prevention and response procedures,
- inspections, and
- training.

Responsibilities include inspection and maintenance of stormwater management devices (translate that to mean cleaning oil/water separators, catch basins, etc.). Testing equipment and systems to uncover conditions that could result in discharges of pollutants to surface waters are also included in the program.

If your company uses any of about 200 Section 313 chemicals under SARA Title III, more specific plans are required to be submitted.

Summary of the basic framework of the stormwater regulations

Nonmunicipal permit applications will need to provide the following information:

- A site map showing the topography of the facility and surrounding land owned by the permit applicant, locations of stormwater outfalls, paved areas and buildings, material storage areas, hazardous waste treatment, storage, or disposal areas and surface water bodies receiving stormwater runoff.
- An estimate of the area of impervious surfaces, total area drained by each outfall, a historical description of any materials stored or used on site including spills, descriptions of stormwater controls, and a description of treatment of stormwater runoff including controls for illicit discharges to the system.
- Monitoring data for any pollutants suspected to be in the stormwater based on the activities performed on site. This includes flow rates and date and duration of the storm events during which sampling occurred.
- Group permit information may vary somewhat from individual permits.

What will a permit require?

Permit requirements will include best management practices to prevent pollutants from entering stormwater. These could range from performing as many manufacturing activities indoors or under cover as possible, using good spill prevention programs, installing detention basins, education efforts, increased street sweeping, fertilizer and pesticide control

Notes

Vehicle Maintenance Pro

Notes

ordinances, pet waste control ordinances, and reducing air pollutant emissions. There may also be some numeric limits imposed on certain pollutants found in stormwater.

A copy of the regulations may be obtained from your local library. They were originally published in the November 16, 1990, *Federal Register* and were entitled 40 CFR Part 122.

Information on the stormwater program is available at:

Industrial Stormwater Program US EPA Headquarters / Office of Water / Office of Wastewater Management / Water Permits Division 1200 Pennsylvania Ave NW (4203M) Washington, DC 20460 Phone: (202) 564-0577 Fax: (202) 564-6431.

Community right to know and emergency planning

Community right to know

A related area of regulation (generically called community right to know) is briefly described below.

Title III of the Superfund Amendments and Reauthorization Act (SARA) of 1986 is one of EPA's most complex set of regulations. The following is a brief explanation of the regulation.

The latest environmental regulation is a confusing aggregation dealing with the community's right to know what is being produced and stored in its midst. On October 17, 1986, the President signed into law the Superfund Amendments and Reauthorization Act of 1986 (SARA).

Title III of SARA establishes new authorities for emergency planning and preparedness, emergency release notification, community right-to-know reporting, and toxic chemical release reporting.

Title III of SARA, also known as the Emergency Planning and Community Right-to-Know Act of 1986, is intended to encourage and support emergency planning efforts at the state and local levels. It also aims to provide the public and local governments with information concerning potential chemical hazards present in their communities.

Industries are required to report what hazardous substances they have in-house and to provide safety and health information related to these substances. This data is intended to help communities focus on the substances and facilities of the most immediate concern for emergency planning and response.

There is a lot of confusion as to which companies are regulated, which chemicals are covered, and exactly what information must be transmitted and to whom. Your company may be covered under the regulations in one section, but not the next.

There are three separate ways that your facility might be regulated under SARA's Title III community right to know requirements. There are many confusing and seemingly contradictory details to sort out under each of the three aspects. The following is a breakdown of the three areas

Compliance Management

(Emergency Planning and Release Notification, Community Right To Know Programs, and Toxic Chemical Release Reporting):

Emergency Planning and Release Notification

These regulations are found in the Act — Title III, Sections 301-305, and in the regulations as 40 CFR Part 355.

What facilities are regulated under this part?

Any facility which has present a regulated amount of any one of EPA's designated Extremely Hazardous Substances or a CERCLA hazardous substance must comply with the requirements of this section.

What list of chemicals is used and where do I find it?

The chemicals under this section are on EPA's List of Extremely Hazardous Substances and Their Threshold Planning Quantities. This list is found in Part 355, Appendix A and Appendix B.

Also cited in this section is the CERCLA list. This is called the Hazardous Substances and Their Reportable Quantities List and is found in Section 302.4.

Both of these lists can be found in the REGULATIONS section of this guide.

Are there minimum threshold levels for emergency notification?

Each chemical on the list of Extremely Hazardous Substances has a Threshold Planning Quantity assigned to it. This value was determined based on the relative potential hazards posed by the individual substances. Notification is triggered by the presence of amounts in excess of these listed quantities.

"Amount" means the total amount of an extremely hazardous substance present at any one time at concentrations greater than one percent by weight, regardless of location, number of containers, or method of storage.

Similarly, the CERCLA list has a Reportable Quantity assigned to each substance. The release of a Reportable Quantity of a substance triggers notification requirements.

How are amounts of extremely hazardous substances determined for solids and mixtures?

For mixtures: If you have a mixture or a solution that contains more than one percent of a listed substance, you must multiply the concentration of the extremely hazardous substance (in weight percent) by the weight of the total quantity of mixture in the container.

For example: If you have 200 pounds of Mixture ABC, which is 25% sulfuric acid, then the actual quantity of regulated substance is 200 pounds $\times$ 25%, or 50 pounds.

Notes

Vehicle Maintenance Pro

Notes

For solids: There are two threshold planning quantities shown for solids on the Extremely Hazardous Substance lists in Part 355 (i.e., 500/10,000 pounds). The solid is subject to the higher amount (10,000 pounds), unless one of the following applies:

- The solid exists in powdered form and has a particle size less than 100 microns;
- The solid is handled in solution or in molten form; or
- The solid meets the criteria for a National Fire Protection Association (NFPA) rating of 2, 3, or 4 for reactivity.

If the solid meets any of these three criteria, then the lower amount (500 pounds) applies.

What must a regulated facility do to comply with this requirement?

The facility must comply with the Emergency Planning Notification and Emergency Release Notification requirements.

Emergency Planning Notification (§355.30)

If you start using, producing, or storing an extremely hazardous substance, you must report to the commission within 60 days that your facility is now subject to these requirements:

- “Commission” means the emergency response commission for the State in which the facility is located. In the absence of an emergency response commission, the Governor and the chief executive officer, respectively, shall be the commission. Where there is a cooperative agreement between a State and a Tribe, the commission shall be the entity identified in the agreement.
- A facility emergency coordinator must be designated for all regulated companies. The owner/operator of each company must appoint a coordinator who will cooperate with local committees. Local emergency response committees should be notified as to who the coordinator is.
- Local committees must be informed of any changes occurring at your facility which may be relevant to emergency planning. Any request by the local committees for information necessary for the development of the local emergency plan should be promptly complied with.

Emergency Release Notification (§355.40)

Facilities must provide emergency notification whenever there is a release of a Reportable Quantity of any Extremely Hazardous Substance or CERCLA hazardous substance.

“Release” is defined as any spilling, leaking, pumping, pouring, emptying, discharging, or disposing into the environment. This includes the abandonment or discarding of barrels or other closed receptacles.

Compliance Management

Any release which results in exposure to persons solely within the boundaries of your facility does not require notification under this regulation.

Immediate notification must be made to the community emergency coordinator of the local committee, and the State commission for any area which may be affected by the release. This notification should be oral (via telephone, radio, or in person).

This notification should include:

- Chemical name or identity of substance released.
- Whether the substance is an Extremely Hazardous Substance.
- Estimate of quantity released.
- Time and duration of release.
- Media into which release occurred.
- Any known or anticipated acute or chronic health risks.
- Medical advice for exposed individuals, where appropriate.
- Precautions to take and evacuation procedures.
- Names and telephone numbers of contact person.

As soon as possible, a written followup notice should be submitted. Included in this written notice should be additional information with respect to:

- Actions taken to respond to and contain the release.
- Any known or anticipated acute or chronic health risks.
- Medical advice for exposed individuals, where appropriate.

Exceptions:

For a transportation-related release, the owner/operator of a facility can provide the emergency notification information to the 911 operator.

“Transportation-related release” means a release during transportation or storage, when the substance is moving under active shipping papers and has not reached the final consignee.

CERCLA releases — If a Reportable Quantity of any hazardous substance is released in a 24-hour period, immediately notify the National Response Center (800) 424-8802; in Washington D.C. (202) 426-2675. (See 302.6)

What are the possible penalties for noncompliance?

Civil penalties - \$25,000-\$75,000 for each day during which the violation continues.

Criminal penalties - \$25,000-\$50,000 in fines, 2-5 years in jail.

Notes

Vehicle Maintenance Pro

Notes

Right to know reporting

These requirements are covered in the Act — Title III, Sections 311-312, and in the regulations at 40 CFR Part 370.

What facilities are regulated under this part?

Any facility which must prepare or have available material safety data sheets under OSHA's Hazard Communication Standard must comply with the requirements. Also, facilities with chemicals in quantities that equal or exceed the following thresholds must report:

- For Extremely Hazardous Substances (EHSs), either 500 pounds or the Threshold Planning Quantity (TPQ), whichever is lower.
- For all other hazardous chemicals, 10,000 pounds.

The minimum threshold for reporting in response to requests for submission of an MSDS or a Tier II form shall be zero. To sum this requirement up, if you receive a request from an authority having jurisdiction, you need to provide the MSDS or the Tier II.

What is a hazardous substance under this regulation?

Hazardous substances are any substances for which a facility must maintain a Material Safety Data Sheet (MSDS) under the OSHA Hazard Communication Standard, which lists the criteria used to identify a hazardous substance. MSDSs are detailed information sheets that provide data on health hazards and physical hazards of chemicals along with associated protective measures. Over 500,000 products have MSDSs which are normally obtained from the chemical manufacturer.

What are facilities required to do?

Under the Emergency Planning and Community Right-to-Know Act (EPCRA) Section 311, facilities must submit the same MSDSs they maintain for OSHA to their SERC, LEPC, and local fire department. Or, facilities may choose to submit a detailed list of the same chemicals instead. This is a one-time submittal; facilities have three months after becoming subject to the OSHA regulations to submit their material.

Facilities that need to submit MSDSs or chemical lists under Section 311, also need to submit an annual inventory report for the same chemicals (EPCRA Section 312). This inventory report must be submitted to the SERC, LEPC and local fire department by March 1 of each year.

How do I submit an Inventory Report?

Facilities covered by these requirements must submit an emergency and hazardous chemical inventory form to the LEPC, the SERC and the local fire department annually. Facilities provide either a Tier I or Tier II form. Most States require the Tier II form. Tier II forms require basic facility identification information, employee contact information for both emergencies and non-emergencies, and information about chemicals stored or used at the facility:

- The chemical name or the common name as indicated on the MSDS.

Compliance Management

- An estimate of the maximum amount of the chemical present at any time during the preceding calendar year and the average daily amount.
- A brief description of the manner of storage of the chemical.
- The location of the chemical at the facility.
- An indication of whether the owner of the facility elects to withhold location information from disclosure to the public.

Check with your state agency for details.

You must allow onsite inspection by the fire department, upon request, and shall provide specific location information regarding the hazardous chemicals at the facility.

What are the possible penalties for noncompliance?

Violation of the MSDS reporting requirements can result in \$10,000 in fines per violation.

Violation of the inventory reporting requirements can result in \$25,000 in fines per violation.

Each day that a violation continues is considered a separate violation.

Toxic Chemical Release Reporting

These requirements are found in the Act at Title III, Section 313, and in the regulations at 40 CFR Part 372.

What facilities are covered under this part?

If a facility meets all of the following criteria, it is a covered facility for that calendar year:

- The facility has 10 or more full-time employees.
- The facility falls in SIC major group codes 10 (except 1011, 1081, and 1094), 12 (except 1241), or 20 through 39; industry codes 4911, 4931, or 4939 (limited to facilities that combust coal and/or oil for the purpose of generating power for distribution in commerce); or 4953 (limited to facilities regulated under RCRA, subtitle C), 5169, 5171, or 7389 (limited to facilities primarily engaged in solvent recovery services on a contract or fee basis) by virtue of the fact that it meets one of certain criteria (see 40 CFR 372.22(b)).
- The facility handles a statutory quantity of a toxic chemical as defined in 40 CFR §372.65.

What facilities are covered under the new “alternate threshold” rule?

The Alternate Threshold Rule is for facilities with low annual reportable amounts of a listed chemical. If a facility meets the current section 313 reporting thresholds, but estimates that the total annual reportable amount of the chemical does not exceed 500 pounds per year, then it can

Notes

Vehicle Maintenance Pro

Notes

apply a threshold of 1 million pounds per year, provided that certain conditions are met. See §372.27 Alternate Threshold Certification and Instructions if you believe this rule may apply to you.

What facilities are covered under the Supplier Notification Requirements of this part?

If the facility meets the following criteria, it is regulated:

- Falls within SIC Codes 20-39,
- Manufactures or processes a toxic chemical, and
- Sells this toxic chemical to a facility regulated under Subpart A and B.

Are there minimum threshold levels for toxic chemicals before reporting is required?

Reporting must be done for toxic chemicals **manufactured** or **processed** in the following amounts:

- 25,000 pounds of the chemical for the year.
- Reporting must be done if a facility **otherwise uses** 10,000 pounds of a designated chemical during the calendar year.

How do manufacturing, processing, and otherwise uses differ?

“Manufacturing” means to produce, prepare, import, or compound a toxic chemical. This includes the coincidental production of a toxic chemical (e.g., as a byproduct or impurity) resulting from the manufacture, processing, use, or disposal of other chemical substances.

“Processing” means the preparation of a toxic chemical after its manufacture for distribution in commerce. In general, processing includes making mixtures, repackaging, or use of a chemical as a feedstock, raw material, or starting material for making another chemical. It also includes incorporating a chemical into an article.

“Otherwise used” means any use of a toxic chemical, including a toxic chemical contained in a mixture or other trade name product or waste, that is not covered by the terms manufacture or process. Otherwise use of a toxic chemical does not include disposal, stabilization (without subsequent distribution in commerce), or treatment for destruction unless:

(1) The toxic chemical that was disposed, stabilized, or treated for destruction was received from off-site for the purposes of further waste management; or

(2) The toxic chemical that was disposed, stabilized, or treated for destruction was manufactured as a result of waste management activities on materials received from off-site for the purposes of further waste management activities. Relabeling or redistributing of the toxic chemical where no repackaging of the toxic chemical occurs does not constitute otherwise use or processing of the toxic chemical.

Compliance Management

What must a regulated facility do under this section?

Submit EPA Form R, The Toxic Chemical Release Inventory Reporting Form (See Section 372.85)

This form serves two purposes: a toxic chemical inventory form, and a form to report chemical releases to the environment.

Every covered facility must annually submit a completed EPA Form R (EPA Form 9350-1) both to the EPA and the State indicating inventory and releases of each toxic chemical handled in excess of the threshold quantity for a calendar year.

If the facility is owned by one person but operated by another then either person may report. However, if a report is not submitted for a covered facility, EPA would hold both persons liable for any applicable penalties.

Where is Form R to be sent upon completion?

Submissions must be sent to both EPA and the State (or the designated official of an Indian tribe). If a report is not received by both EPA and the State (or the designated official of an Indian tribe), the submitter is considered out of compliance and subject to enforcement action.

Facilities located on Indian land should send a copy to the Chief Executive Officer of the applicable Indian tribe. Some tribes have entered into a cooperative agreement with States; in this case, report submissions should be sent to the entity designated in the cooperative agreement.

If the alternate threshold applies, then a **certification** is submitted instead of the Form R.

What is the Form A?

Reporting facilities are allowed to use Form A, a simpler and easier to complete form, for non-PBT (Persistent, Bioaccumulative, and Toxic) chemicals, so long as releases or other disposal is not greater than 2,000 pounds as part of the total waste management limit for the chemical, which is not more than 5,000 pounds.

Form A may be used for certain chemicals of greater concern, i.e., PBT chemicals, when there are no releases or other disposal and no more than 500 pounds of other waste management (e.g., recycling or treatment).

“Non-production related waste,” i.e., waste from one-time events such as facility cleanups or extraordinary weather events must be counted when determining eligibility to use Form A.

What is the difference between Form R and Form A?

Form R provides details about releases and other waste management (e.g., total quantity of releases to air, water, and land; and on- and off-site recycling, treatment, and combustion for energy recovery). Form A provides the name of the chemical and certain facility identification information.

Notes

Vehicle Maintenance Pro

Notes

Form A can be used by the public as a “range report,” i.e., an indication that the facility manages as waste between 0 and 500 pounds of a PBT chemical as waste and has no releases or other disposal.

For a non-PBT chemical, a facility manages between 0 and 5,000 pounds of the chemical as waste, of which no more than 2,000 pounds is released or otherwise disposed. Four chemicals may be reported on each Form A; only one chemical may be reported on a Form R.

Recordkeeping

Form R

A copy of each report (Form R) submitted must be retained for 3 years. All supporting materials and documentation used to complete the report must also be retained for 3 years.

Supplier notifications

If you are subject to the notification requirements, a copy of each supplier notice must be retained for 3 years, along with all supporting materials and documentation used to determine whether a notice is required and what it must contain.

Alternate threshold certification

If you are subject to the alternate threshold, a copy of each certification submitted must be retained for 3 years. All supporting materials and documentation used to complete the report must also be retained for 3 years.

Support Documentation

Facilities must also maintain those documents, calculations, worksheets, and other forms upon which they relied to gather information for prior Form R reports. In the event of a problem with data elements on a facility’s Form R, EPA may request documentation from the facility that supports the information reported. In the future, EPA may conduct data quality reviews of past Form R submissions. An essential component of this process would be to review a facility’s records for accuracy and reliability.

Suggested records to keep to prove EPA compliance

Here is a partial list of records, organized by year, that a facility should maintain:

- Previous years’ Form Rs;
- Section 313 Reporting Threshold Worksheets;
- Engineering calculations and other notes;
- Purchase records from suppliers;
- Inventory data;

Compliance Management

- EPA (NPDES) permits;
- EPCRA Section 312, Tier II Reports
- Monitoring records;
- Flowmeter data;
- RCRA Hazardous Waste Generator's Report;
- Pretreatment reports filed by the facility with the local government;
- Invoices from waste management companies;
- Manufacturer's estimates of treatment efficiencies;
- RCRA Manifests;
- Process diagrams that indicate emissions and releases; and
- Spill prevention, control, and countermeasures (SPCC) plans.

All records must be kept at the reporting facility and available for inspection by EPA. If the facility is closed permanently, the records must be kept by the owner or operator of the facility, or sent to EPA.

What are the possible penalties for noncompliance?

Civil penalties - \$25,000 for each day for each violation

Vehicle Maintenance Pro

Compliance Management Self Audits	Notes
DOT Self Audit — Calculating factor rating for the Vehicle Factor portion of a Compliance Review Determining the Vehicle Factor rating during a DOT compliance review (audit) is a two-step process. The first step involves checking the carrier’s performance in roadside inspections (calculating the carrier’s out-of-service rate). The second step involves verifying compliance with the inspection and maintenance regulations found in Part 396. These two steps are then combined to generate the carrier’s rating for the Vehicle Factor. While the maintenance pro may be peripherally involved in the other five factors that make up a Compliance Review, the Vehicle Factor is the one that the maintenance pro is directly responsible for. Determine the vehicle out-of-service rate for the company: - Number of roadside inspections in which the vehicle received an out-of-service violation _____ (“a” in formula). Total number of vehicle inspections _____ (“b” in formula) Divide “a” by “b” (a/b). This gives you the percentage of inspections in which a vehicle was issued an out-of-service violation. $\frac{\text{_____}}{\text{_____}} = \text{_____} \times 100 = \text{out-of-service percentage (rate)}.$ If the rate is below 34 percent, it is considered “Satisfactory.” If the out-of-service rate is 34 percent or higher, this is considered “Conditional.” Out-of-Service rate is considered _____ Determining regulatory compliance with the Vehicle Factor Below is each regulation checked during a compliance review. The regulation number is listed first, followed by a statement (or series of statements). After each is a location to record the score for each regulation. All regulations and interpretations are listed in the regulations portion of this manual.	

Vehicle Maintenance Pro

Notes

§396.3 — We systematically maintain records of systematic inspection and vehicle maintenance for each vehicle controlled over 30 days including:

- Vehicle identification (company number, make, serial number, year, tire size, and vehicle owner's name, if not company owned).
- Nature and due date of inspections and maintenance (a maintenance schedule).
- Record of inspections, maintenance, and repairs (including date and nature).
- Record of tests on push-out windows, emergency doors, and door-marking lights (for buses only).
- Company retains all maintenance, repair, and inspection records for 1 year, and for 6 months after vehicle leaves company control.
- Company has procedures for systematic inspection, maintenance, and repair of vehicles (check for maintenance schedules, and policies and procedures).

Check vehicle files. Each missing component counts as one violation. If more than 10 percent of the files checked are not in compliance, one point must be assigned to the audit score.

_____ **Score for this regulation.**

§396.9(c)(2) — We have not required or permitted the operation of a motor vehicle declared out of service before repairs were made (and documented) in the previous year.

Check vehicle files. If one vehicle was operated after being placed out of service without proof of repairs, one point must be assigned to the audit score.

_____ **Score for this regulation.**

396.9(d)(2) — Drivers submit inspection reports within 24 hours, upon arrival at next company location, or immediately mail reports to the company. The company reviews all inspection reports and notes and corrects violations or defects thereon. Within 15 days following the date of the inspection, the company:

- Corrects any violations noted (out-of-service violations were repaired before the vehicle was operated), can document that the repairs were completed, and signs the report certifying all violations noted on the report have been corrected.
- The "Signature of Carrier Official, Title, and Date Signed" portion of the form has been completed by a responsible company official.
- The roadside inspection form is returned to the issuing agency, *even if no violations were noted*.
- The company maintains copies of reports and proof of repairs for one year.

Compliance Management

Check vehicle files. If one report was not completed by a carrier official and/or was not sent in to the correct authority, or you cannot document the repair of a violation, one point must be assigned to the audit score.

_____ **Score for this regulation.**

396.11(a) —We require driver to prepare driver vehicle inspection report upon the completion of each workday. This report includes:

- A written (DVIR) report is completed each day for every vehicle operated.
- List of defects (or comments indicating no defects found).
- Driver's signature of the driver completing the DVIR.
- If defect noted, certification of repair (or comments indicating no repairs needed) signed by a carrier official or person performing repairs.

We retain the completed DVIRs for 3 months.

Check vehicle files. Each missing component counts as one violation. If more than 10 percent of the files checked are not in compliance, one point must be assigned to the audit score.

_____ **Score for this regulation.**

396.11(c) —We correct out-of-service defects listed by driver in a driver vehicle inspection report before the vehicle is operated again, and have documentation in the vehicle file to prove it.

Check vehicle files. If one vehicle was operated after the driver noted an out-of-service defect without proof of repairs, one point must be assigned to the audit score.

_____ **Score for this regulation.**

396.17(c) —Each company-operated commercial vehicle is inspected every 12 months, the annual inspection reports (original or copy) are retained by the company for 14 months, the inspections and associated forms meet criteria as found in Part 396 and Appendix G, and the inspectors' certifications (to perform annual inspections and brake service) are on file at the company.

Check vehicle files. Each missing component counts as one violation. If more than 10 percent of the files checked are not in compliance, one point must be assigned to the audit score.

_____ **Score for this regulation.**

396.17(g) —We promptly repair parts and accessories not meeting minimum periodic inspection standards during an annual inspection before operating the vehicle and document the repairs.

Check vehicle files. If one vehicle was operated without proof of repairs, one point must be assigned to the audit score.

_____ **Score for this regulation.**

Notes

Vehicle Maintenance Pro

Notes

Determining the Vehicle Factor score and rating

Assign a point value to out-of-service rating. If rating was satisfactory, score 0. If conditional, score 1. Then total scores from regulations. Add these together to determine Vehicle Factor score.

_____ Out-of-service rating score

_____ Regulator compliance score

_____ **Vehicle Factor score**

Next, use the table below to convert the score to a rating.

0 points	Satisfactory
1 point	Conditional
2 or more points	Unsatisfactory

Vehicle Factor Rating _____

Determining your CSA Vehicle Maintenance BASIC Measure

Determining your CSA Vehicle Maintenance BASIC Measure

Step 1

Locate all roadside inspection reports from the past two years that involved a vehicle inspection, or vehicle or cargo securement violation (do not use vehicle violations that appeared on a "Driver Only" inspection or securement violations cited under the hazardous material regulations). Write in the date of the inspection in the "date" column on the table below.

Step 2

Time weight all the inspections, good and bad as you enter them onto the table. An inspection that occurred in the last 6 months is given a time weight of 3, 6 to 12 months ago 2, and more than a year ago 1. Write the date in the date column and the time weight in the "time weight" column.

Step 3

Locate all vehicle and cargo securement violations on the inspection report. Locate the severity weight in the table provided in the Compliance Management Chapter for each vehicle violation on the inspection report. If the violation led to an out-of-service order, increase the violation severity by 2. If the same violation is repeated on an inspection report, only use it once. Write this violation and the related value in the "violation and violation severity" columns for each inspection. If an inspection has more than 4 vehicle violations, use the violation area in the next inspection area on the table.

Step 4

Add up the severity weights for all violations on each inspection. If the severity weights add up to more than 30, stop at 30. If the inspection had no violations, its severity weighting is 0. Write this total in the box next to "Total S and T weighted for entire inspection" in the correct column.

Compliance Management

Step 5

Time weight the total severity weight total for each inspection. This is done by multiplying the severity weight by the appropriate time weight. The time weight is based on the date of inspection. The time weight for an inspection that took place in the last 6 months is 3, 6 to 12 months ago 2, and more than a year ago 1. Write this total in the "S and T Weighted Value" column.

Step 6

Add the severity and time weighted total for all inspections together. Enter the total at the bottom of the table. Then add up all of the inspection time weights and enter this total at the bottom of the "Time Weight" column.

Step 7

To get the BASIC Measure, divide the total of all time and severity weighted violations by the time weighted inspections total. Record BASIC Measure at the very bottom of the table.

OSHA

Worker Right to Know self-audit checklist

- ☐ Is your chemical inventory list still up-to-date?
- ☐ Do you periodically review and update the chemical inventory list?
- ☐ Are all containers labeled appropriately?
- ☐ Are your SDSs systematically reviewed?
- ☐ Is your employee training program really effective?
- ☐ Can employees answer relevant questions about the chemicals they work with?
- ☐ Do your employees receive periodic refresher training and training upon the introduction of new chemicals into the workplace?
- ☐ Do you maintain documentation of the training conducted?
- ☐ Have policies and procedures been documented in a written program?
- ☐ Do you periodically review and update the written program?
- ☐ Is the written program readily available for employees to read upon request?
- ☐ Have you identified all contractors and exchanged information on hazardous chemicals with them?
- ☐ Is special training provided for chemicals used on non-routine jobs?

Compliance Management

OSHA SDS self-audit checklist

- ☐ Do chemical manufacturers and importers provide an SDS for each hazardous chemical you have on site?
- ☐ Do employees have access to an SDS for each hazardous chemical used?
- ☐ Does each SDS contain the identity used on the label?
- ☐ Does each SDS contain the chemical name and common names for single-substance hazardous chemicals?
- ☐ For mixtures tested as a whole, does each SDS contain the chemical and common names of the ingredients that contribute to these known hazards? Does each SDS contain the common names of the mixture itself?
- ☐ For mixtures not tested as a whole, does each SDS contain the chemical and common names of all ingredients that are health hazards (1 percent concentration or greater)?
- ☐ Does each SDS contain the chemical and common names of all ingredients that are health hazards and present a risk to employees in concentrations of less than 1 percent or 0.1 percent for carcinogens?
- ☐ Does each SDS contain the chemical and common names of all ingredients that have been determined to present a physical hazard when present in the mixture?
- ☐ Does each SDS contain the physical and chemical characteristics of the hazardous chemical (vapor pressure, flash point, etc.)?
- ☐ Does each SDS contain the primary routes of entry?
- ☐ Does each SDS contain the OSHA permissible exposure limit (PEL), the ACGIH threshold limit value (TLV), and other exposure limits?
- ☐ Does each SDS contain information on carcinogen listings?
- ☐ Is each SDS written in English?
- ☐ Does each SDS contain generally applicable procedures and precautions for the safe handling and use of the chemical (hygienic practices, maintenance and spill procedures, etc.)?
- ☐ Does each SDS contain applicable control measures (engineering controls, work practices, or personal protective equipment)?
- ☐ Does each SDS contain emergency and first-aid procedures?
- ☐ Does each SDS contain the date of preparation or last change?
- ☐ Does each SDS contain the name, address, and telephone number of the responsible party?

HAZWOPER Audit Checklist

Following you will find an Audit Checklist to see how you measure up with HAZWOPER preparations, if that regulation applies to you.

- ☐ Do your employees clean up at uncontrolled hazardous waste sites or at EPA-licensed waste treatment, storage, and disposal facilities?
- ☐ Do you have employees assigned to respond to emergencies involving hazardous materials?
- ☐ Do you need to have the written program that identifies, evaluates, and controls safety and health hazards and provides emergency response procedures for each hazardous waste site or treatment, storage, and disposal facility?
- ☐ Does the written program include the following:
 - ☐ An organizational workplan
 - ☐ Site evaluation and control
 - ☐ A site-specific program
 - ☐ Monitoring
 - ☐ Medical surveillance program
 - ☐ Decontamination procedures
 - ☐ Emergency response program?
 - ☐ Is it periodically updated?
 - ☐ Is it made available to all affected employees, contractors, and subcontractors?
- ☐ Do you have a workplan that establishes a chain of command and employer and employee responsibilities?
- ☐ Have you carried out a site evaluation and established a control plan?
- ☐ Have employees been provided with the requisite information and training for their respective positions?
- ☐ Is there a Personal Protective Equipment Program?
- ☐ Is the requisite monitoring carried out?
- ☐ Is the required medical surveillance of employees carried out?
- ☐ Are emergency response procedures developed?
- ☐ Has your facility implemented feasible and useful engineering controls and work practices?
- ☐ Are employee exposure and medical records kept for 30 years and made available to the employee upon request?

Audit Item/Practice Check (✓) if item/practice not in compliance

LP Gas

- ☐ Is liquified petroleum gas stored, handled, and used in accordance with safe practices and standards? 29 CFR 1910.110(e)(2)(iv); 178(f)(2)
- ☐ Are "No Smoking" signs posted on liquified petroleum gas tanks? 29 CFR 1910.106(d)(7)(iii), (e)(6)(i)
- ☐ Are liquified petroleum storage tanks guarded to prevent damage from vehicles? 29 CFR 1910.110(f)(2)(i)&(ii)

Flammable/Combustible Containers

- ☐ Are approved containers and portable tanks used for the storage and handling of flammable and combustible liquids? 29 CFR 1910.106(d)(2)
- ☐ Are all connections on drums and combustible liquid piping, vapor and liquid tight? 29 CFR 1910.106(c)(3)
- ☐ Are all flammable liquids kept in closed containers when not in use (e.g., parts cleaning tanks, pans, etc.)? 29 CFR 1910.22(c); 106(e)(2)(iv)(a)
- ☐ Are bulk drums of flammable liquids grounded and bonded to containers during dispensing? 29 CFR 1910.106(e)(6)(ii)
- ☐ Are safety cans used for dispensing flammable or combustible liquids at a point of use? 29 CFR 1910.106(d)(5)(iii)
- ☐ Are storage tanks adequately vented to prevent the development of excessive vacuum or pressure as a result of filling, emptying, or atmosphere temperature changes? 29 CFR 1910.106(b)(4)(ii)
- ☐ Are portable storage tanks equipped with emergency venting that will relieve excessive internal pressure caused by fire exposure? 29 CFR 1910.106(d)(2)(ii)
- ☐ Are storage cabinets used to hold flammable liquids, labeled "Flammable — Keep Fire Away"? 29 CFR 1910.106(d)(3)(ii)
- ☐ Are flammable liquids, such as gasoline, kept in an approved safety can? 29 CFR 1910.106(d)(2); 144(a)(1)

Flammable/Combustible Handling

- ☐ Are firm separators placed between containers of combustibles or flammables, when stacked one upon another, to assure their support and stability? 29 CFR 1910.106(f)(1)(iii)
- ☐ Are all containers over 30 gallons in inside storage rooms stacked individually? 29 CFR 1910.106(d)(4)(v)

Flammable/Combustible Storage

- ☐ Is proper storage of flammable or combustible materials practiced to minimize the risk of fire including spontaneous combustion?
- ☐ Are all solvent wastes, and flammable liquids kept in fire-resistant, covered containers until they are removed from the worksite? 29 CFR 1910.22(c)
- ☐ Is vacuuming used whenever possible rather than blowing or sweeping combustible dust? 29 CFR 1910.141(a)(4)(ii)
- ☐ Are combustible scrap, debris, and waste materials (oil rags, etc.) stored in covered metal receptacles and removed from the worksite promptly? 29 CFR 1910.106(e)(9)(iii)
- ☐ Are all spills of flammable or combustible liquids cleaned up promptly? 29 CFR 1910.106(e)(9)(i)

- ☐ Are "No Smoking" rules enforced in areas involving storage and use of hazardous materials? 29 CFR 1910.106(e)(9)

Hazard Communication Labels

- ☐ Are all chemical containers marked with contents name and hazards? 29 CFR 1910.1200(f)(5)
- ☐ Are storage cabinets used to hold flammable liquids labeled "Flammable—Keep Fire Away"? 29 CFR 1910.106(d)(3)(ii)
- ☐ For a fixed extinguishing system, is a sign posted warning of the hazards presented by the extinguishing medium? 29 CFR 1910.160(b)(5)

First Aid

- ☐ Do you have emergency eye wash and shower facilities within the immediate work area where employees are exposed to injurious corrosive materials? 29 CFR 1910.151(c), 124(g)(2), 1048(i)(3)

Housekeeping

- ☐ Are work areas clean? 29 CFR 1910.22(a)
- ☐ Are all spilled materials or liquids cleaned up immediately? 29 CFR 1910.141(a)(3)(ii)

Aisles

- ☐ Are aisles marked? 29 CFR 1910.22(b)(2)
- ☐ Are aisle widths maintained? 29 CFR 1910.22(b)(1)
- ☐ Are aisles in good condition? 29 CFR 1910.22(b)(1)
- ☐ Is there one clear aisle at least 3 feet wide? 29 CFR 1910.106(d)(4)(v), (5)(vi)(f), (e)(9)(ii)

Exits

- ☐ Are exits properly marked? 29 CFR 1910.37(q)
- ☐ Does lighting in hallways and exit signs conform to government standards (5 foot-candles)? 29 CFR 1910.37(q)(6)
- ☐ Any emergency power supply? 29 CFR 1910.37(q)(6)
- ☐ Are exits kept free of obstructions? 29 CFR 1910.36(d)(1)

Fire Alarm Systems

- ☐ If you have a non-supervised fire alarm system, is it tested bimonthly? 29 CFR 1910.165(d)(2)
- ☐ If you have a supervised employee alarm system (that is, does the alarm have a device that indicates system malfunction), is it tested yearly? 29 CFR 1910.165(d)(4)

Fire Extinguishers

- ☐ Are appropriate fire extinguishers mounted, located, and identified so that they are readily accessible to employees? 29 CFR 1910.157(c)(1)
- ☐ Are all fire extinguishers inspected and recharged regularly, and noted on the inspection tag? 29 CFR 1910.157(e)
- ☐ Are portable fire extinguishers provided in adequate number and type? 29 CFR 1910.157(d)
- ☐ For a fixed extinguishing system, is a sign posted warning of the hazards presented by the extinguishing medium? 29 CFR 1910.160(b)(5)

EPA

Hazardous waste audit

- ☐ Does your facility generate less than 100 kilograms per month of hazardous waste?
- ☐ Does your facility have an EPA Identification Number?
- ☐ Does your facility generate solid wastes that exhibit hazardous characteristics?
- ☐ Are there any other solid wastes generated?
- ☐ Does your company test all wastes to determine which wastes are non-hazardous?
- ☐ Are the people in your facility who are responsible for shipping hazardous waste familiar with DOT regulations?
- ☐ Is each container marked in accordance with DOT requirements?
- ☐ Does your facility store wastes for more than 90 days?
- ☐ Is there an effort or a program to prevent storage for more than 90 days?
- ☐ Are there containers you use to store waste temporarily before transport?
- ☐ Is each container marked with an approved hazardous waste label?
- ☐ Is each container clearly dated?
- ☐ Do you inspect containers for leakage and/or corrosion at least weekly?
- ☐ Does your facility ensure that containers holding ignitable or reactive waste are at least 50 feet from the facility's property line?
- ☐ Does your storage area provide secondary containment?
- ☐ Does your facility receive waste from off-site?
- ☐ Do you have sufficient aisle space to allow unobstructed movement of personnel and equipment?
- ☐ Does your facility maintain personnel training records at the facility?
- ☐ Do the training records include a job title and written job description of each position and a description of type and amount of training?
- ☐ Are the records of training given to operations' personnel?
- ☐ Does your facility have a contingency plan?
- ☐ Is the plan maintained at your facility?
- ☐ Does the plan include a current SPCC plan?

Notes

Vehicle Maintenance Pro

Notes

- ☐ Is there an emergency coordinator on site or on call at all times?
- ☐ Have arrangements been made with local authorities to familiarize them with your facility, its layout, and possible hazards?
- ☐ Has your facility arranged to familiarize local hospitals with the properties of hazardous waste handled and types of injuries that could result from fires, explosions, or releases at the facility?
- ☐ Does your facility handle ignitable or reactive wastes?
- ☐ Are ignitable wastes handled and stored in such a manner that fires and/or explosions are prevented?
- ☐ Is there any evidence of heat generation from incompatible wastes?
- ☐ Is your facility equipped with adequate communication and safety equipment?
- ☐ Does your facility store any hazardous materials in underground storage tanks (USTs)?
- ☐ Has your facility notified the appropriate state agency of its USTs?
- ☐ Has your facility initiated a program to minimize the amount and toxicity of waste generated?
- ☐ Does the owner or operator keep a written operating record at the facility?
- ☐ Do records include :
 - ☐ A description and quantity of each hazardous waste received?
 - ☐ The location and quantity of each hazardous waste at each location?
 - ☐ The records and results of waste analyses?
 - ☐ The records of incidents involving implementation of a contingency plan?
 - ☐ The records and results of required inspections?
 - ☐ Any monitoring, testing or analytical data?
 - ☐ A closure plan and cost estimate?
- ☐ Does the owner or operator maintain a written inspection schedule at the facility?
- ☐ Does the inspection schedule include:
 - ☐ Monitoring equipment?
 - ☐ Safety and emergency equipment?
 - ☐ Security devices?
 - ☐ Operating and structural equipment?

Compliance Management

- ☐ Types of problems with equipment, such as malfunctions and operator error?
- ☐ Does your facility maintain a copy of a waste analysis plan?
- ☐ Does the plan include:
 - ☐ The parameters for which waste will be analyzed?
 - ☐ The test methods used to test for these parameters?
 - ☐ The sampling method used to obtain the sample?
 - ☐ The frequency with which the initial analyses will be reviewed or repeated?
- ☐ Does the owner or operator maintain an inspection log?
- ☐ Does the log include:
 - ☐ The date and time of inspection?
 - ☐ The name of the inspector(s)?
 - ☐ A notation of observations?
 - ☐ The date and nature of repairs or remedial actions?
- ☐ Does your facility provide adequate security?
- ☐ Does your facility use the Uniform Hazardous Waste Manifest for each off-site shipment?
- ☐ Does your facility have a system to maintain these reports for 3 years:
 - ☐ Manifests and signed copies from designated facilities?
 - ☐ Biennial reports?
 - ☐ Exception reports?
 - ☐ Test results?
- ☐ Has the facility ever been inspected by a state agency or EPA for RCRA compliance?
- ☐ Was a Notice of Violation received as a result of the inspection?
- ☐ Have all off-site hazardous waste disposal facilities been inspected and approved by representatives of your Company?

Notes

Vehicle Maintenance Pro

Notes

UST audit checklist

- ☐ Does your facility have any old unused USTs on the premises?
- ☐ Does your facility store only non-hazardous materials in USTs?
- ☐ Does your facility store any hazardous materials in USTs?
- ☐ Does your facility store any petroleum products in USTs?
- ☐ Has your facility notified the appropriate state agency about its USTs?
- ☐ Have you determined and used the proper EPA or state notification form?
- ☐ Are the USTs on your premises visually inspected on a regular basis?
- ☐ Has your company instituted a method of release detection for all new and existing USTs?
- ☐ Do you know and follow release reporting, investigation, and confirmation procedures?
- ☐ Do you follow proper release response and corrective action procedures?
- ☐ Are you aware of and have you begun to prepare for the financial responsibility provisions for petroleum USTs?
- ☐ Have you established a record keeping procedure and files for general operating requirements, release detection, closure of USTs, and financial responsibility provisions?
- ☐ Are you aware of and do you follow required reporting procedures for UST systems, general operating requirements, releases, closure, and financial responsibility?

Clean water NPDES permits audit checklist

- ☐ Are there any storm water point sources outfalls at this facility?
- ☐ Does this facility have an NPDES PERMIT?
- ☐ If yes, who is the issuing authority (EPA, state, or both)?
- ☐ What is the NPDES permit expiration date? _____
- ☐ How many and what kind of outfalls are listed on the permit?
 - ☐ Process wastewater
 - ☐ Utility wastewater
 - ☐ Sanitary wastewater
 - ☐ Storm water
 - ☐ Combination

Compliance Management

- ☐ Are there special NPDES restrictions (i.e., priority pollutant analysis, bio-monitoring, etc.) and/or reporting requirements?
- ☐ Is this facility under any permit compliance schedule?
- ☐ Has this facility filed any noncompliance reports within the last three years?
- ☐ Is there a procedure for handling permit excursions?
- ☐ Are noncompliance incidents reported within five working days?
- ☐ Are there any outstanding Notices of Violation or Administrative Orders?
- ☐ Are all on-site treatment systems properly operated, maintained and fully functional?
- ☐ Does this facility have or use any of the priority pollutants?
- ☐ Has the facility's effluent been analyzed for any priority pollutants?
- ☐ How are required samples taken and by whom?
_____?
- ☐ Does this facility have a formalized and documented training program for samplers?
- ☐ Are the samples properly labeled, i.e., time, date, sampler, outfall?
- ☐ Are the samples preserved?
- ☐ Is the time lapse between sampling and analyses kept to a minimum?
- ☐ Does this facility analyze for any permit parameters in its own laboratory?
- ☐ Are your analytical records pertaining to the permit parameters kept a minimum of three years?
- ☐ Is the analyzer and date of analysis identified for each analysis?
- ☐ Are EPA analytical methods used for all permit parameter analysis?
- ☐ Does the lab have an analytical audit/quality control program?
- ☐ Are lab personnel periodically trained and checked for accuracy?
- ☐ Are any outside labs used for the required permit analyses?
- ☐ Is the time lapse between sampling and analyses kept to a minimum?
- ☐ Are quality control and outside analytical records kept a minimum of 3 years?
- ☐ Are the analyzer and date and method of analysis identified for each analysis and part of the documentation record?
- ☐ Are EPA analytical methods used for all quality control analyses?

Notes

Vehicle Maintenance Pro

Notes

- ☐ Is the lab certified by a state or federal agency?
- ☐ Have you reviewed the lab's last agency inspection report?
- ☐ Do you have a copy of the outside laboratory's quality assurance and audit program results?
- ☐ Are discharge monitoring reports (DMR) submitted?
- ☐ Are the DMRs submitted on time?
- ☐ Is there a designated person who signs the DMRs?
- ☐ Does the facility have a letter of signature authorization?
- ☐ Are samples saved until results are available?
- ☐ Are all monitoring/laboratory equipment maintenance documented?
- ☐ Are procedures in place to notify EPA when a change in activity has occurred causing discharge of toxic pollutants significantly (10 times) above or not in permit limits?

Community Right to Know Audit

- ☐ Does the SIC Code of your facility fall under the requirements of SARA Title III?
- ☐ Are you aware of the Threshold Planning Quantities for hazardous substances on your site?
- ☐ Has your facility notified the State Emergency Response Commission that it is subject to SARA Section 302?
- ☐ Did you retain a copy of the notification document?
- ☐ Has your facility expanded its release reporting procedures?
- ☐ Has your facility reported the identity, listing, quantity, time and duration, environmental media, risks and precautions to the relevant agencies and departments relative to releases of hazardous substances at this site?
- ☐ Have you provided the Local Emergency Planning Committee with the identity and ways to contact your facility's emergency coordinator(s)?
- ☐ Do you provide all of the required information about your facility's Emergency Coordinator(s)?
- ☐ Are Material Safety Data Sheets (MSDSs) for toxic and hazardous substances imported, manufactured, processed, used, handled, treated, or stored at the site kept on file?
- ☐ Have you appointed a person who is responsible for maintaining the MSDSs?
- ☐ Has your facility submitted MSDSs and a listing of extremely hazardous substances to the SERC, LEPC and local fire department?

Compliance Management

	Notes
☐ Have you kept a record of this transmittal?	
☐ Have you prepared and submitted an inventory of hazardous chemical substances at this facility to the SERC and/or LEPC?	
☐ Did you include a signed certification statement, technical contact, chemical activity, facility's and chemical's identity, chemical's use, quantity, and location?	
☐ Do you have a record of this transmittal?	
☐ Has your facility prepared and submitted its toxic chemical release information to the EPA, SERC, and LEPC for all non-federally permitted releases?	
☐ Does your facility have an existing community awareness and emergency response program?	
☐ Has your facility developed and implemented an environmental spill prevention, control, and countermeasures (SPCC) plan as part of its community awareness and emergency response program?	
☐ Has the SERC and LEPC been presented with a copy of your facility's SPCC plan?	
☐ Does your SPCC plan provide general facility information?	
☐ Does it include information on the following:	
☐ Facility description with number of employees?	
☐ Storage tanks and process vessels?	
☐ Hazardous waste storage?	
☐ Loading and unloading facilities?	
☐ Piping?	
☐ Facility security?	
☐ Lighting?	
☐ Does your SPCC plan address release prevention programs?	
☐ Are the following parts included in your SPCC plan?	
☐ Relief valve inspection and maintenance program?	
☐ Preventive maintenance?	
☐ Corrosion protection?	
☐ Tank integrity, inspection, and leak detection?	
☐ Emission and discharge monitoring?	
☐ Drum control program?	
☐ Personnel training?	
☐ Does your SPCC plan address atmospheric release control and countermeasures?	

Vehicle Maintenance Pro

Notes

- ☐ Does your SPCC plan include the following atmospheric release control and countermeasures aspects?
 - ☐ Air pollution abatement systems?
 - ☐ Alarm and alert systems?
 - ☐ Containment measures?
 - ☐ Special precautions against uncontrolled releases?
- ☐ Does your SPCC plan address release control for hazardous waste as well as other hazardous substances?
- ☐ Does your SPCC plan address the following aspects of the hazardous substances and waste release control:
 - ☐ Containment and diversionary structures?
 - ☐ Release potential, prediction, and impact models?
 - ☐ Commitment of manpower and equipment?
 - ☐ Facility drainage?
 - ☐ Hazardous waste storage?
 - ☐ Personnel training?
 - ☐ High-level alarms and other special precautions?
 - ☐ Inspections?
 - ☐ Release history?
- ☐ Does your SPCC plan address emergency response and control?
- ☐ Does your plan have an internal emergency response notification list?
- ☐ Does the emergency response and control section of the facility's plan have an evacuation plan?
- ☐ Does your SPCC plan detail the responsibilities and actions of those responding to the emergency?
- ☐ Does your SPCC plan include other relevant emergency control and response parts such as:
 - ☐ Release and emergency response equipment?
 - ☐ Arrangements with local authorities?
- ☐ Does your plan have the most current federal, state, and local reporting requirements?
- ☐ Does your plan include a list of the most recent reportable quantities of hazardous substances on your site or at your facility?
- ☐ Does your plan include the following forms and tables:
 - ☐ Storage tank inspection form

Notes	
☐ Drum area inspection form	
☐ Environmental incident report form	
☐ SPCC, hazardous substances, and waste management training program schedules	
☐ Environmental and emergency agency contact form	
☐ Hazardous chemicals inventory form	
☐ Environmental inspection form	
☐ Air pollution abatement equipment work order log	
☐ Facility layout and area map	
☐ Job titles and descriptions	
☐ Release response equipment list	
☐ Emergency equipment list	
☐ Personal protection equipment list	
☐ Emergency notification list	
☐ Outside emergency contacts	
☐ Medical emergency information	
☐ Material Safety Data Sheets	
☐ Waste analysis plan	
☐ Release decision tree	
☐ Release decision scenarios	
☐ Do you have the facility's management approval of and commitment to your plan?	
☐ Do you have professional certifications attesting to the accuracy and functional effectiveness of your plan?

Regulations

Selected FMCSA regulations

This section includes selected sections of the Federal Motor Carrier Administration (FMCSA) regulations that pertain to the operation of a transportation maintenance facility. If you are interested in other FMCSA regulations that are not in this section, please contact J. J. Keller & Associates, Inc. We have several other products that specialize in FMCSA regulations.

Part 393—Parts and accessories necessary for safe operation

Subpart A—General

Sec.	
393.1	Scope of the rules in this part.
393.3	Additional equipment and accessories.
393.5	Definitions.
393.7	Matter incorporated by reference.

Subpart B—Lamps, Reflective Devices, and Electrical Wiring

393.9	Lamps operable, prohibition of obstructions of lamps and reflectors.
393.11	Lamps and reflective devices.
393.13	Retroreflective sheeting and reflex reflectors, requirements for semitrailers and trailers manufactured before December 1, 1993.
393.17	Lamps and reflectors - combinations in driveaway-tow-away operation.
393.19	Hazard warning signals.
393.20	[Reserved]
393.22	Combination of lighting devices and reflectors.
393.23	Power supply for lamps.
393.24	Requirements for head lamps, auxiliary driving lamps and front fog lamps.
393.25	Requirements for lamps other than head lamps.
393.26	Requirements for reflex reflectors.
393.27	[Reserved]
393.28	Wiring systems.
393.29	[Reserved]
393.30	Battery installation.
393.31–393.33	[Reserved]

Subpart C—Brakes

393.40	Required brake systems.
393.41	Parking brake system.
393.42	Brakes required on all wheels.
393.43	Breakaway and emergency braking.
393.44	Front brake lines, protection.
393.45	Brake tubing and hoses; hose assemblies and end fittings.
393.46	[Reserved]
393.47	Brake actuators, slack adjusters, linings/pads, and drums/rotors.
393.48	Brakes to be operative.
393.49	Single valve to operate all brakes.

393.50	Reservoirs required.
393.51	Warning signals, air pressure and vacuum gauges.
393.52	Brake performance.
393.53	Automatic brake adjusters and brake adjustment indicators.
393.55	Antilock brake systems.

Subpart D—Glazing and Window Construction

393.60	Glazing in specified openings.
393.61	Truck and truck tractor window construction.
393.62	Emergency exits for buses.
393.63	[Reserved]

Subpart E—Fuel Systems

393.65	All fuel systems.
393.67	Liquid fuel tanks.
393.68	Compressed natural gas fuel containers.
393.69	Liquefied petroleum gas systems.

Subpart F—Coupling Devices and Towing Methods

393.70	Coupling devices and towing methods, except for drive-away-towaway operations.
393.71	Coupling devices and towing methods, driveaway-tow-away operations.

Subpart G—Miscellaneous Parts and Accessories

393.75	Tires.
393.76	Sleeper berths.
393.77	Heaters.
393.78	Windshield wiping and washing systems.
393.79	Windshield defrosting and defogging systems.
393.80	Rear-vision mirrors.
393.81	Horn.
393.82	Speedometer.
393.83	Exhaust systems.
393.84	Floors.
393.85	[Reserved]
393.86	Rear impact guards and rear end protection.
393.87	Warning flags on projecting loads.
393.88	Television receivers.
393.89	Buses, driveshaft protection.
393.90	Buses, standee line or bar.
393.91	Buses, aisle seats prohibited.
393.92	[Reserved]
393.93	Seats, seat belt assemblies and seat belt assembly anchorages.
393.94	Interior noise levels in power units.

Subpart H—Emergency Equipment

393.95	Emergency equipment on all power units.

Subpart I—Protection Against Shifting and Falling Cargo

393.100	Which types of commercial motor vehicles are subject to the cargo securement standards of this subpart, and what general requirements apply?
393.102	What are the minimum performance criteria for cargo securement devices and systems?
393.104	What standards must cargo securement devices and systems meet in order to satisfy the requirements of this subpart?
393.106	What are the general requirements for securing articles of cargo?

Vehicle Maintenance Pro

- 393.108 How is the working load limit of a tiedown, or the load restraining value of a friction mat, determined?
- 393.110 What else do I have to do to determine the minimum number of tiedowns?
- 393.112 Must a tiedown be adjustable?
- 393.114 What are the requirements for front end structures used as part of a cargo securement system?

Specific securement requirements by commodity type

- 393.116 What are the rules for securing logs?
- 393.118 What are the rules for securing dressed lumber or similar building products?
- 393.120 What are the rules for securing metal coils?
- 393.122 What are the rules for securing paper rolls?
- 393.124 What are the rules for securing concrete pipe?
- 393.126 What are the rules for securing intermodal containers?
- 393.128 What are the rules for securing automobiles, light trucks and vans?
- 393.130 What are the rules for securing heavy vehicles, equipment and machinery?
- 393.132 What are the rules for securing flattened or crushed vehicles?
- 393.134 What are the rules for securing roll-on/roll-off or hook lift containers?
- 393.136 What are the rules for securing large boulders?

Subpart J—Frames, Cab and Body Components, Wheels, Steering, and Suspension Systems

- 393.201 Frames.
- 393.203 Cab and body components.
- 393.205 Wheels.
- 393.207 Suspension systems.
- 393.209 Steering wheel systems.

Subpart A—General

§393.1 Scope of the rules in this part.

(a) The rules in this part establish minimum standards for commercial motor vehicles as defined in §390.5 of this title. Only motor vehicles (as defined in §390.5) and combinations of motor vehicles which meet the definition of a commercial motor vehicle are subject to the requirements of this part. All requirements that refer to motor vehicles with a GVWR below 4,536 kg (10,001 pounds) are applicable only when the motor vehicle or combination of motor vehicles meets the definition of a commercial motor vehicle.

(b)(1) Every motor carrier and its employees must be knowledgeable of and comply with the requirements and specifications of this part.

(2) Every intermodal equipment provider and its employees or agents responsible for the inspection, repair, and maintenance of intermodal equipment interchanged to motor carriers must be knowledgeable of and comply with the applicable requirements and specifications of this part.

(c) No motor carrier may operate a commercial motor vehicle, or cause or permit such vehicle to be operated, unless it is equipped in accordance with the requirements and specifications of this part.

(d) No intermodal equipment provider may operate intermodal equipment, or cause or permit such equipment to be operated, unless it is equipped in accordance with the requirements and specifications of this part.

§393.3 Additional equipment and accessories.

The use of additional equipment or accessories in a manner that decreases the safety of operation of a commercial motor vehicle in interstate commerce is prohibited. Nothing contained in this subchapter shall be construed to prohibit the use of additional equipment and accessories, not inconsistent with or prohibited by this subchapter, provided such equipment and accessories do not decrease the safety of operation of the motor vehicles on which they are used.

§393.5 Definitions.

As used in this part, the following words and terms are construed to mean:

Aggregate working load limit. The summation of the working load limits or restraining capacity of all devices used to secure an article of cargo on a vehicle.

Agricultural commodity trailer. A trailer that is designed to transport bulk agricultural commodities in off road harvesting sites and to a processing plant or storage location, as evidenced by skeletal construction that accommodates harvest containers, a maximum length of 28 feet, and an arrangement of air control lines and reservoirs that minimizes damage in field operations.

Air brake system. A system, including an air-over-hydraulic brake subsystem, that uses air as a medium for transmitting pressure or force from the driver control to the service brake, but does not include a system that uses compressed air or vacuum only to assist the driver in applying muscular force to hydraulic or mechanical components.

Air-over-hydraulic brake subsystem. A subsystem of the air brake system that uses compressed air to transmit a force from the driver control to a hydraulic brake system to actuate the service brakes.

Anchor point. Part of the structure, fitting or attachment on a vehicle or article of cargo to which a tiedown is attached.

Antilock Brake System or ABS. Means a portion of a service brake system that automatically controls the degree of rotational wheel slip during braking by:

- (1) Sensing the rate of angular rotation of the wheels;
- (2) Transmitting signals regarding the rate of wheel angular rotation to one or more controlling devices which

Regulations

interpret those signals and generate responsive controlling output signals; and

(3) Transmitting those controlling signals to one or more modulators which adjust brake actuating forces in response to those signals.

Article of cargo. A unit of cargo, other than a liquid, gas, or aggregate that lacks physical structure (e.g., grain, gravel, etc.) including articles grouped together so that they can be handled as a single unit or unitized by wrapping, strapping, banding or edge protection device(s).

Auxiliary driving lamp. A lighting device mounted to provide illumination forward of the vehicle which supplements the upper beam of a standard headlighting system. It is not intended for use alone or with the lower beam of a standard headlamp system.

Bell pipe concrete. Pipe whose flanged end is of larger diameter than its barrel.

Blocking. A structure, device or another substantial article placed against or around an article of cargo to prevent horizontal movement of the article of cargo.

Boat trailer. A trailer designed with cradle-type mountings to transport a boat and configured to permit launching of the boat from the rear of the trailer.

Bracing. A structure, device, or another substantial article placed against an article of cargo to prevent it from tipping, that may also prevent it from shifting.

Brake. An energy conversion mechanism used to stop, or hold a vehicle stationary.

Brake power assist unit. A device installed in a hydraulic brake system that reduces the operator effort required to actuate the system, but which if inoperative does not prevent the operator from braking the vehicle by a continued application of muscular force on the service brake control.

Brake power unit. A device installed in a brake system that provides the energy required to actuate the brakes, either directly or indirectly through an auxiliary device, with the operator action consisting only of modulating the energy application level.

Brake tubing/hose. Metallic brake tubing, nonmetallic brake tubing and brake hose are conduits or lines used in a brake system to transmit or contain the medium (fluid or vacuum) used to apply the motor vehicle's brakes.

Chassis. The load-supporting frame of a commercial motor vehicle, exclusive of any appurtenances which might be added to accommodate cargo.

Clearance lamps. Lamps that provide light to the front or rear, mounted on the permanent structure of the vehicle, such that they indicate the overall width of the vehicle.

Container chassis trailer. A semitrailer of skeleton construction limited to a bottom frame, one or more axles, specially built and fitted with locking devices for the transport of intermodal cargo containers, so that when the chassis and container are assembled, the units serve the same function as an over the road trailer.

Converter dolly. A motor vehicle consisting of a chassis equipped with one or more axles, a fifth wheel and/or equivalent mechanism, and drawbar, the attachment of which converts a semitrailer to a full trailer.

Crib-type log trailer. Means a trailer equipped with stakes, bunks, a front-end structure, and a rear structure to restrain logs. The stakes prevent movement of

the logs from side to side on the vehicle while the front-end and rear structures prevent movement of the logs from front to back on the vehicle.

Curb weight. The weight of a motor vehicle with standard equipment, maximum capacity of fuel, oil, and coolant; and, if so equipped, air conditioning and additional weight of optional engine. Curb weight does not include the driver.

Dunnage. All loose materials used to support and protect cargo.

Dunnage bag. An inflatable bag intended to fill otherwise empty space between articles of cargo, or between articles of cargo and the wall of the vehicle.

Edge protector. A device placed on the exposed edge of an article to distribute tiedown forces over a larger area of cargo than the tiedown itself, to protect the tiedown and/or cargo from damage, and to allow the tiedown to slide freely when being tensioned.

Electric brake system. A system that uses electric current to actuate the service brake.

Emergency brake. A mechanism designed to stop a motor vehicle after a failure of the service brake system.

Emergency brake system. A mechanism designed to stop a vehicle after a single failure occurs in the service brake system of a part designed to contain compressed air or brake fluid or vacuum (except failure of a common valve, manifold brake fluid housing or brake chamber housing).

Fifth wheel. A device mounted on a truck tractor or similar towing vehicle (e.g., converter dolly) which interfaces with and couples to the upper coupler assembly of a semitrailer.

Frame vehicle. A vehicle with skeletal structure fitted with one or more bunk units for transporting logs. A bunk unit consists of U-shaped front and rear bunks that together cradle logs. The bunks are welded, gusseted or otherwise firmly fastened to the vehicle's main beams, and are an integral part of the vehicle.

Friction mat. A device placed between the deck of a vehicle and article of cargo, or between articles of cargo, intended to provide greater friction than exists naturally between these surfaces.

Front fog lamp. A lighting device whose beam provides downward illumination forward of the vehicle and close to the ground, and is to be used only under conditions of rain, snow, dust, smoke or fog. A pair of fog lamps may be used alone, with parking, tail, side, marker, clearance and identification lamps, or with a lower beam headlamp at the driver's discretion in accordance with state and local use law.

Fuel tank fitting. Any removable device affixed to an opening in the fuel tank with the exception of the filler cap.

g. The acceleration due to gravity, 32.2 ft/sec² (9.81 m/sec²).

Grommet. A device that serves as a support and protection to that which passes through it.

Hazard warning signal. Lamps that flash simultaneously to the front and rear, on both the right and left sides of a commercial motor vehicle, to indicate to an approaching driver the presence of a vehicular hazard.

Head lamps. Lamps used to provide general illumination ahead of a motor vehicle.

Vehicle Maintenance Pro

Heater. Any device or assembly of devices or appliances used to heat the interior of any motor vehicle. This includes a catalytic heater which must meet the requirements of §177.834(1)(2) of this title when Class 3 (flammable liquid) or Division 2.1 (flammable gas) is transported.

Heavy hauler trailer. A trailer which has one or more of the following characteristics, but which is not a container chassis trailer:

(1) Its brake lines are designed to adapt to separation or extension of the vehicle frame; or

(2) Its body consists only of a platform whose primary cargo-carrying surface is not more than 1,016 mm (40 inches) above the ground in an unloaded condition, except that it may include sides that are designed to be easily removable and a permanent “front-end structure” as that term is used in §393.106 of this title.

Hook-lift container. A specialized container, primarily used to contain and transport materials in the waste, recycling, construction/demolition and scrap industries, which is used in conjunction with specialized vehicles, in which the container is loaded and unloaded onto a tilt frame body by an articulating hook-arm.

Hydraulic brake system. A system that uses hydraulic fluid as a medium for transmitting force from a service brake control to the service brake, and that may incorporate a brake power assist unit, or a brake power unit.

Identification lamps. Lamps used to identify certain types of commercial motor vehicles.

Integral securement system. A system on certain roll-on/roll-off containers and hook-lift containers and their related transport vehicles in which compatible front and rear hold down devices are mated to provide securement of the complete vehicle and its articles of cargo.

Lamp. A device used to produce artificial light.

Length of a manufactured home. The largest exterior length in the traveling mode, including any projections which contain interior space. Length does not include bay windows, roof projections, overhangs, or eaves under which there is no interior space, nor does it include drawbars, couplings or hitches.

License plate lamp. A lamp used to illuminate the license plate on the rear of a motor vehicle.

Longwood. Means all logs, including utility poles, that are not shortwood, i.e., that are over 4.9 m (16 feet) long. Such logs are usually described as long logs or treelength.

Low chassis vehicle. (1) A trailer or semitrailer manufactured on or after January 26, 1998, having a chassis which extends behind the rearmost point of the rearmost tires and which has a lower rear surface that meets the guard width, height, and rear surface requirements of §571.224 in effect on the date of manufacture, or a subsequent edition.

(2) A motor vehicle, not described by paragraph (1) of this definition, having a chassis which extends behind the rearmost point of the rearmost tires and which has a lower rear surface that meets the guard configuration requirements of §393.86(b)(1).

Manufactured home. Means a structure, transportable in one or more sections, which in the traveling mode, is eight body feet or more in width or forty body feet or

more in length, or, when erected on site, is three hundred twenty or more square feet, and which is built on a permanent chassis and designed to be used as a dwelling with or without a permanent foundation when connected to the required utilities, and includes the plumbing, heating, air-conditioning, and electrical systems contained therein. Calculations used to determine the number of square feet in a structure will be based on the structure's exterior dimensions measured at the largest horizontal projections when erected on site. These dimensions will include all expandable rooms, cabinets, and other projections containing interior space, but do not include bay windows. This term includes all structures which meet the above requirements except the size requirements and with respect to which the manufacturer voluntarily files a certification pursuant to 24 CFR 3282.13 and complies with the standards set forth in 24 CFR part 3280.

Metal coil. Means an article of cargo comprised of elements, mixtures, compounds, or alloys commonly known as metal, metal foil, metal leaf, forged metal, stamped metal, metal wire, metal rod, or metal chain that are packaged as a roll, coil, spool, wind, or wrap, including plastic or rubber coated electrical wire and communications cable.

Multi-piece windshield. A windshield consisting of two or more windshield glazing surface areas.

Parking brake system. A mechanism designed to prevent the movement of a stationary motor vehicle.

Play. Any free movement of components.

Pulpwood trailer. A trailer or semitrailer that is designed exclusively for harvesting logs or pulpwood and constructed with a skeletal frame with no means for attachment of a solid bed, body, or container.

Rail vehicle. A vehicle whose skeletal structure is fitted with stakes at the front and rear to contain logs loaded crosswise.

Rear extremity. The rearmost point on a motor vehicle that falls above a horizontal plane located 560 mm (22 inches) above the ground and below a horizontal plane located 1,900 mm (75 inches) above the ground when the motor vehicle is stopped on level ground; unloaded; its fuel tanks are full; the tires (and air suspension, if so equipped) are inflated in accordance with the manufacturer's recommendations; and the motor vehicle's cargo doors, tailgate, or other permanent structures are positioned as they normally are when the vehicle is in motion. Nonstructural protrusions such as taillamps, rubber bumpers, hinges and latches are excluded from the determination of the rearmost point.

Reflective material. A material conforming to Federal Specification LS 300, “Sheeting and Tape, Reflective; Non exposed Lens, Adhesive Backing,” (September 7, 1965) meeting the performance standard in either Table 1 or Table 1A of SAE Standard J594f, “Reflex Reflectors” (January, 1977).

Reflex reflector. A device which is used on a vehicle to give an indication to an approaching driver by reflected light from the lamps on the approaching vehicle.

Saddle-mount. A device, designed and constructed as to be readily demountable, used in driveaway-towaway operations to perform the functions of a conventional fifth wheel:

Regulations

(1) Upper-half. "Upper-half" of a "saddle-mount" means that part of the device which is securely attached to the towed vehicle and maintains a fixed position relative thereto, but does not include the "king-pin;"

(2) Lower-half. "Lower-half" of a "saddle-mount" means that part of the device which is securely attached to the towing vehicle and maintains a fixed position relative thereto but does not include the "king-pin;" and

(3) King pin. "King-pin" means that device which is used to connect the "upper-half" to the "lower-half" in such manner as to permit relative movement in a horizontal plane between the towed and towing vehicles.

Service brake system. A primary brake system used for slowing and stopping a vehicle.

Shoring bar. A device placed transversely between the walls of a vehicle and cargo to prevent cargo from tipping or shifting.

Shortwood. All logs typically up to 4.9 m (16 feet) long. Such logs are often described as cut-up logs, cut-to-length logs, bolts or pulpwood. Shortwood may be loaded lengthwise or crosswise, though that loaded crosswise is usually no more than 2.6 m (102 inches) long.

Side extremity. The outermost point on a side of the motor vehicle that is above a horizontal plane located 560 mm (22 inches) above the ground, below a horizontal plane located 1,900 mm (75 inches) above the ground, and between a transverse vertical plane tangent to the rear extremity of the vehicle and a transverse vertical plane located 305 mm (12 inches) forward of that plane when the vehicle is unloaded; its fuel tanks are full; and the tires (and air suspension, if so equipped) are inflated in accordance with the manufacturer's recommendations. Non-structural protrusions such as taillights, hinges and latches are excluded from the determination of the outermost point.

Side marker lamp (Intermediate). A lamp mounted on the side, on the permanent structure of the motor vehicle that provides light to the side to indicate the approximate middle of the vehicle, when the motor vehicle is 9.14 meters (30 feet) or more in length.

Side marker lamps. Lamps mounted on the side, on the permanent structure of the motor vehicle as near as practicable to the front and rear of the vehicle, that provide light to the side to indicate the overall length of the motor vehicle.

Sided vehicle. A vehicle whose cargo compartment is enclosed on all four sides by walls of sufficient strength to contain articles of cargo, where the walls may include latched openings for loading and unloading, and includes vans, dump bodies, and a sided intermodal container carried by a vehicle.

Special purpose vehicle. (1) A trailer or semitrailer manufactured on or after January 26, 1998, having work-performing equipment that, while the motor vehicle is in transit, resides in or moves through the area that could be occupied by the horizontal member of the rear impact guard, as defined by the guard width, height and rear surface requirements of §571.224 (paragraphs S5.1.1 through S5.1.3), in effect on the date of manufacture, or a subsequent edition.

(2) A motor vehicle, not described by paragraph (1) of this definition, having work-performing equipment that,

while the motor vehicle is in transit, resides in or moves through the area that could be occupied by the horizontal member of the rear impact guard, as defined by the guard width, height and rear surface requirements of §393.86(b)(1).

Split service brake system. A brake system consisting of two or more subsystems actuated by a single control designed so that a leakage-type failure of a pressure component in a single subsystem (except structural failure of a housing that is common to two or more subsystems) shall not impair the operation of any other subsystem.

Steering wheel lash. The condition in which the steering wheel may be turned through some part of a revolution without associated movement of the front wheels.

Stop lamps. Lamps shown to the rear of a motor vehicle to indicate that the service brake system is engaged.

Surge brake. A self-contained, permanently closed hydraulic brake system for trailers that relies on inertial forces, developed in response to the braking action of the towing vehicle, applied to a hydraulic device mounted on or connected to the tongue of the trailer, to slow down or stop the towed vehicle.

Tail lamps. Lamps used to designate the rear of a motor vehicle.

Tiedown. A combination of securing devices which forms an assembly that attaches articles of cargo to, or restrains articles of cargo on, a vehicle or trailer, and is attached to anchor point(s).

Tow bar. A strut or column-like device temporarily attached between the rear of a towing vehicle and the front of the vehicle being towed.

Tractor-pole trailer. A combination vehicle that carries logs lengthwise so that they form the body of the vehicle. The logs are supported by a bunk located on the rear of the tractor, and another bunk on the skeletal trailer. The tractor bunk may rotate about a vertical axis, and the trailer may have a fixed, scoping, or cabled reach, or other mechanical freedom, to allow it to turn.

Trailer kingpin. A pin (with a flange on its lower end) which extends vertically from the front of the underside of a semitrailer and which locks into a fifth wheel.

Turn signals. Lamps used to indicate a change in direction by emitting a flashing light on the side of a motor vehicle towards which a turn will be made.

Upper coupler assembly. A structure consisting of an upper coupler plate, king pin and supporting frame-work which interfaces with and couples to a fifth wheel.

Upper coupler plate. A plate structure through which the king pin neck and collar extend. The bottom surface of the plate contacts the fifth wheel when coupled.

Vacuum brake system. A system that uses a vacuum and atmospheric pressure for transmitting a force from the driver control to the service brake, not including a system that uses vacuum only to assist the driver in applying muscular force to hydraulic or mechanical components.

Void filler. Material used to fill a space between articles of cargo and the structure of the vehicle that has sufficient strength to prevent movement of the articles of cargo.

Vehicle Maintenance Pro

Well. The depression formed between two cylindrical articles of cargo when they are laid with their eyes horizontal and parallel against each other.

Wheels back vehicle. (1) A trailer or semitrailer manufactured on or after January 26, 1998, whose rearmost axle is permanently fixed and is located such that the rearmost surface of the tires (of the size recommended by the vehicle manufacturer for the rear axle) is not more than 305 mm (12 inches) forward of the transverse vertical plane tangent to the rear extremity of the vehicle.

(2) A motor vehicle, not described by paragraph (1) of this definition, whose rearmost axle is permanently fixed and is located such that the rearmost surface of the tires (of the size recommended by the vehicle manufacturer for the rear axle) is not more than 610 mm (24 inches) forward of the transverse vertical plane tangent to the rear extremity of the vehicle.

Width of a manufactured home. The largest exterior width in the traveling mode, including any projections which contain interior space. Width does not include bay windows, roof projections, overhangs, or eaves under which there is no interior space.

Windshield. The principal forward facing glazed surface provided for forward vision in operating a motor vehicle.

Working load limit (WLL). The maximum load that may be applied to a component of a cargo securement system during normal service, usually assigned by the manufacturer of the component.

Regulations

§393.7 Matter incorporated by reference.

(a) **Incorporation by reference.** Part 393 includes references to certain matter or materials, as listed in paragraph (b) of this section. The text of the materials is not included in the regulations contained in part 393. The materials are hereby made a part of the regulations in part 393. The Director of the Federal Register has approved the materials incorporated by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. For materials subject to change, only the specific version approved by the Director of the Federal Register and specified in the regulation are incorporated. Material is incorporated as it exists on the date of the approval and a notice of any change in these materials will be published in the *Federal Register*.

(b) **Matter or materials referenced in part 393.** The matter or materials listed in this paragraph are incorporated by reference in the corresponding sections noted.

(1) Auxiliary Upper Beam Lamps, Society of Automotive Engineers (SAE) J581, July 2004, incorporation by reference approved for §393.24(b).

(2) Front Fog Lamp, SAE J583, August 2004, incorporation by reference approved for §393.24(b).

(3) Stop Lamps for Use on Motor Vehicles Less Than 2032 mm in Overall Width, SAE J586, March 2000, incorporation by reference approved for §393.25(c).

(4) Stop Lamps and Front- and Rear-Turn Signal Lamps for Use on Motor Vehicles 2032 mm or more in Overall Width, SAE J2261, January 2002, incorporated by reference approved for §393.25(c).

(5) Tail Lamps (Rear Position Lamps) for Use on Motor Vehicles Less Than 2032 mm in Overall Width, SAE J585, March 2000, incorporation by reference approved for §393.25(c).

(6) Tail Lamps (Rear Position Lamps) for Use on Vehicles 2032 mm or More in Overall Width, SAE J2040, March 2002, incorporation by reference approved for §393.25(c).

(7) Turn Signal Lamps for Use on Motor Vehicles Less Than 2032 mm in Overall Width, SAE J588, March 2000, incorporation by reference approved for §393.25(c).

(8) Sidemarkers Lamps for Use on Road Vehicles Less Than 2032 mm in Overall Width, SAE J592, August 2000, incorporation by reference approved for §393.25(c).

(9) Directional Flashing Optical Warning Devices for Authorized Emergency, Maintenance, and Service Vehicles, SAE J595, January 2005, incorporation by reference approved for §393.25(e).

(10) Optical Warning Devices for Authorized Emergency, Maintenance, and Service Vehicles, SAE J845, May 1997, incorporation by reference approved for §393.25(e).

(11) Gaseous Discharge Warning Lamp for Authorized Emergency, Maintenance, and Service Vehicles, SAE J1318, May 1998, incorporation by reference approved for §393.25(e).

(12) Reflex Reflectors, SAE J594, December 2003, incorporation by reference approved for §393.26(c).

(13) Standard Specification for Retroreflective Sheet- ing for Traffic Control, American Society of Testing and

Materials, ASTM D 4956-04, 2004, incorporation by reference approved for §393.26(c).

(14) Automobile, Truck, Truck-Tractor, Trailer, and Motor Coach Wiring, SAE J1292, October 1981, incorporated by reference approved for §393.28.

(15) [Reserved]

(16) American National Standard for Safety Glazing Materials for Glazing Motor Vehicles and Motor Vehicle Equipment Operating on Land Highways-Safety Standard, SAE Z26.1-1996, August 1997, incorporation by reference approved for §393.62(d).

(17) Specification for Sound Level Meters, American National Standards Institute, S1.4-1983, incorporation by reference approved for §393.94(c).

(18) Standard Specification for Strapping, Flat Steel and Seals, American Society for Testing and Materials (ASTM), D3953-97, February 1998, incorporation by reference approved for §393.104(e).

(19) Welded Steel Chain Specifications, National Association of Chain Manufacturers, September 28, 2005, incorporation by reference approved for §393.104(e).

(20) Recommended Standard Specification for Synthetic Web Tiedowns, Web Sling and Tiedown Association, WSTDA-T1, 1998, incorporation by reference approved for §393.104(e).

(21) Wire Rope Users Manual, 2nd Edition, Wire Rope Technical Board November 1985, incorporation by reference approved for §393.104(e).

(22) Cordage Institute rope standards approved for incorporation into §393.104(e):

(i) PETRS-2, Polyester Fiber Rope, 3-Strand and 8-Strand Constructions, January 1993;

(ii) PPRS-2, Polypropylene Fiber Rope, 3-Strand and 8-Strand Constructions, August 1992;

(iii) CRS-1, Polyester/Polypropylene Composite Rope Specifications, Three-Strand and Eight-Strand Standard Construction, May 1979;

(iv) NRS-1, Nylon Rope Specifications, Three-Strand and Eight-Strand Standard Construction, May 1979; and

Regulations

(v) C-1, Double Braided Nylon Rope Specifications DBN, January 1984.

(c) **Availability.** The materials incorporated by reference are available as follows:

(1) Standards of the Underwriters Laboratories, Inc. Information and copies may be obtained by writing to: Underwriters Laboratories, Inc., 333 Pfingsten Road, Northbrook, Illinois 60062.

(2) Specifications of the American Society for Testing and Materials. Information and copies may be obtained by writing to: American Society for Testing and Materials, 100 Barr Harbor Drive, West Conshohocken, Pennsylvania 19428-2959.

(3) Specifications of the National Association of Chain Manufacturers. Information and copies may be obtained by writing to: National Association of Chain Manufacturers, P.O. Box 22681, Lehigh Valley, Pennsylvania 18002-2681.

(4) Specifications of the Web Sling and Tiedown Association. Information and copies may be obtained by writing to: Web Sling and Tiedown Association, Inc., 5024-R Campbell Boulevard, Baltimore, Maryland 21236-5974.

(5) Manuals of the Wire Rope Technical Board. Information and copies may be obtained by writing to: Wire Rope Technical Committee, P.O. Box 849, Stevensville, Maryland 21666.

(6) Standards of the Cordage Institute. Information and copies may be obtained by writing to: Cordage Institute, 350 Lincoln Street, 115, Hingham, Massachusetts 02043.

(7) Standards of the Society of Automotive Engineers (SAE). Information and copies may be obtained by writing to: Society of Automotive Engineers, Inc., 400 Commonwealth Drive, Warrendale, Pennsylvania 15096.

(8) Standards of the American National Standards Institute (ANSI). Information and copies may be obtained by writing to: American National Standards Institute, 25 West 43rd Street, New York, New York 10036.

(9) [Reserved].

(10) All of the materials incorporated by reference are available for inspection at:

(i) The Federal Motor Carrier Safety Administration, Office of Bus and Truck Standards and Operations (MC-PS), 1200 New Jersey Ave., SE., Washington, DC 20590-0001; and

(ii) The Office of the Federal Register, 800 North Capitol Street, NW, Suite 700, Washington, DC.

Subpart B—Lamps, reflective devices and electrical wiring

§393.9 Lamps operable, prohibition of obstructions of lamps and reflectors.

(a) All lamps required by this subpart shall be capable of being operated at all times. This paragraph shall not

be construed to require that any auxiliary or additional lamp be capable of operating at all times.

(b) Lamps and reflective devices/material required by this subpart must not be obscured by the tailboard, or by any part of the load, or its covering by dirt, or other added vehicle or work equipment, or otherwise. Exception: The conspicuity treatments on the front end protection devices may be obscured by part of the load being transported.

§393.11 Lamps and reflective devices.

(a)(1) **Lamps and reflex reflectors.** Table 1 specifies the requirements for lamps, reflective devices and associated equipment by the type of commercial motor vehicle. The diagrams in this section illustrate the position of the lamps, reflective devices and associated equipment specified in Table 1. All commercial motor vehicles manufactured on or after December 25, 1968, must, at a minimum, meet the applicable requirements of 49 CFR 571.108 (FMVSS No. 108) in effect at the time of manufacture of the vehicle. Commercial motor vehicles manufactured before December 25, 1968, must, at a minimum, meet the requirements of subpart B of part 393 in effect at the time of manufacture.

(2) **Exceptions:** Pole trailers and trailer converter dollies must meet the part 393 requirements for lamps, reflective devices and electrical equipment in effect at the time of manufacture. Trailers which are equipped with conspicuity material which meets the requirements of §393.11(b) are not required to be equipped with the reflex reflectors listed in Table 1 if—

(i) The conspicuity material is placed at the locations where reflex reflectors are required by Table 1; and

(ii) The conspicuity material when installed on the motor vehicle meets the visibility requirements for the reflex reflectors.

(b) **Conspicuity Systems.** Each trailer of 2,032 mm (80 inches) or more overall width, and with a GVWR over 4,536 kg (10,000 pounds), manufactured on or after December 1, 1993, except pole trailers and trailers designed exclusively for living or office use, shall be equipped with either retroreflective sheeting that meets the requirements of FMVSS No. 108 (S5.7.1), reflex reflectors that meet the requirements FMVSS No. 108 (S5.7.2), or a combination of retroreflective sheeting and reflex reflectors that meet the requirements of FMVSS No. 108 (S5.7.3). The conspicuity system shall be installed and located as specified in FMVSS No. 108 [S5.7.1.4 (for retroreflective sheeting), S5.7.2.2 (for reflex reflectors), S5.7.3 (for a combination of sheeting and reflectors)] and have certification and markings as required by S5.7.1.5 (for retroreflective tape) and S5.7.2.3 (for reflex reflectors).

(c) **Prohibition on the use of amber stop lamps and tail lamps.** No commercial motor vehicle may be equipped with an amber stop lamp, a tail lamp, or other lamp which is optically combined with an amber stop lamp or tail lamp.

Vehicle Maintenance Pro

TABLE 1 OF §393.11—REQUIRED LAMPS AND REFLECTORS ON COMMERCIAL MOTOR VEHICLES

Item on the vehicle	Quantity	Color	Location	Position	Height above the road surface in millimeters (mm) (with English units in parenthesis) measured from the center of the lamp at curb weight	Vehicles for which the devices are required
Headlamps	2	White	Front	On the front at the same height, with an equal number at each side of the vertical center line as far apart as practicable.	Not less than 559 mm (22 inches) nor more than 1,372 mm (54 inches).	A, B, C
Turn signal (front). See footnotes #2 and 12.	2	Amber	At or near the front.	One on each side of the vertical centerline at the same height and as far apart as practicable.	Not less than 381 mm (15 inches) nor more than 2,108 mm (83 inches).	A, B, C
Identification lamps (front). See footnote #1.	3	Amber	Front	As close as practicable to the top of the vehicle, at the same height, and as close as practicable to the vertical centerline of the vehicle (or the vertical centerline of the cab where different from the centerline of the vehicle) with lamp centers spaced not less than 152 mm (6 inches) or more than 305 mm (12 inches) apart. Alternatively, the front lamps may be located as close as practicable to the top of the cab.	All three on the same level as close as practicable to the top of the motor vehicle.	B, C
Tail lamps. See footnotes #5 and 11.	2	Red	Rear	One lamp on each side of the vertical centerline at the same height and as far apart as practicable.	Both on the same level between 381 mm (15 inches) and 1,829 mm (72 inches).	A, B, C, D, E, F, G, H
Stop lamps. See footnotes #5 and 13.	2	Red	Rear	One lamp on each side of the vertical centerline at the same height and as far apart as practicable.	Both on the same level between 381 mm (15 inches) and 1,829 mm (72 inches).	A, B, C, D, E, F, G
Clearance lamps. See footnotes #8, 9, 10, 15 & 17.	2	Amber	One on each side of the front of the vehicle.	One on each side of the vertical centerline to indicate overall width.	Both on the same level as high as practicable.	B, C, D, G, H
Clearance lamps. See footnotes #8, 9, 10, 15 & 17.	2	Red	One on each side of the rear of the vehicle.	One on each side of the vertical centerline to indicate overall width.	Both on the same level as high as practicable.	B, D, G, H
Reflex reflector, intermediate (side).	2	Amber	One on each side.	At or near the midpoint between the front and rear side marker lamps, if the length of the vehicle is more than 9,144 mm (30 feet).	Between 381 mm (15 inches) and 1,524 (60 inches).	A, B, D, F, G
Reflex reflector (rear). See footnotes #5, 6, and 8.	2	Red	Rear	One on each side of the vertical centerline, as far apart as practicable and at the same height.	Both on the same level, between 381 mm (15 inches) and 1,524 mm (60 inches).	A, B, C, D, E, F, G
Reflex reflector (rear side).	2	Red	One on each side (rear).	As far to the rear as practicable.	Both on the same level, between 381 mm (15 inches) and 1,524 mm (60 inches).	A, B, D, F, G
Reflex reflector (front side). See footnote #16.	2	Amber	One on each side (front).	As far to the front as practicable.	Between 381 mm (15 inches) and 1,524 mm (60 inches).	A, B, C, D, F, G
License plate lamp (rear). See footnote #11.	1	White	At rear license plate to illuminate the plate from the top or sides.		No requirements	A, B, C, D, F, G
Side marker lamp (front). See footnote #16.	2	Amber	One on each side.	As far to the front as practicable.	Not less than 381 mm (15 inches).	A, B, C, D, F
Side marker lamp intermediate.	2	Amber	One on each side.	At or near the midpoint between the front and rear side marker lamps, if the length of the vehicle is more than 9,144 mm (30 feet).	Not less than 381 mm (15 inches).	A, B, D, F, G

Regulations

TABLE 1 OF §393.11—REQUIRED LAMPS AND REFLECTORS ON COMMERCIAL MOTOR VEHICLES, Continued

Item on the vehicle	Quantity	Color	Location	Position	Height above the road surface in millimeters (mm) (with English units in parenthesis) measured from the center of the lamp at curb weight	Vehicles for which the devices are required
Side marker lamp (rear). See footnotes #4 and 8.	2	Red	One on each side.	As far to the rear as practicable.	Not less than 381 mm (15 inches), and on the rear of trailers not more than 1,524 mm (60 inches).	A, B, D, F, G
Turn signal (rear). See footnotes #5 and 12.	2	Amber or red	Rear	One lamp on each side of the vertical centerline as far apart as practicable.	Both on the same level, between 381 mm (15 inches) and 2,108 mm (83 inches).	A, B, C, D, E, F, G
Identification lamp (rear). See footnotes #3, 7, and 15.	3	Red	Rear	One as close as practicable to the vertical centerline. One on each side with lamp centers spaced not less than 152 mm (6 inches) or more than 305 mm (12 inches) apart.	All three on the same level as close as practicable to the top of the vehicle.	B, D, G
Vehicular hazard warning signal flasher lamps. See footnotes #5 and 12.	2	Amber	Front	One lamp on each side of the vertical centerline, as far apart as practicable.	Both on the same level, between 381 mm (15 inches) and 2,108 mm (83 inches).	A, B, C
Vehicular hazard warning signal flasher lamps. See footnotes #5 and 12.	2	Amber or red	Rear	One lamp on each side of the vertical centerline, as far apart as practicable.	Both on the same level, between 381 mm (15 inches) and 2,108 mm (83 inches).	A, B, C, D, E, F, G
Backup lamp. See footnote #14.	1 or 2	White	Rear	Rear	No requirement	A, B, C
Parking lamp	2	Amber or white	Front	One lamp on each side of the vertical centerline, as far apart as practicable.	Both on the same level, between 381 mm (15 inches) and 2,108 mm (83 inches).	A

Legend: Types of commercial motor vehicles shown in the last column of Table 1.

A. Buses and trucks less than 2,032 mm (80 inches) in overall width.

B. Buses and trucks 2,032 mm (80 inches) or more in overall width.

C. Truck tractors.

D. Semitrailers and full trailers 2,032 mm (80 inches) or more in overall width except converter dollies.

E. Converter dolly.

F. Semitrailers and full trailers less than 2,032 mm (80 inches) in overall width.

G. Pole trailers.

H. Projecting loads.

Note: Lamps and reflectors may be combined as permitted by §393.22 and S5.4 of 49 CFR 571.108, Equipment combinations.

Footnote—1 Identification lamps may be mounted on the vertical centerline of the cab where different from the centerline of the vehicle, except where the cab is not more than 42 inches wide at the front roofline, then a single lamp at the center of the cab shall be deemed to comply with the requirements for identification lamps. No part of the identification lamps or their mountings may extend below the top of the vehicle windshield.

Footnote—2 Unless the turn signals on the front are so constructed (double-faced) and located as to be visible to passing drivers, two turn signals are required on

the rear of the truck tractor, one at each side as far apart as practicable.

Footnote—3 The identification lamps need not be visible or lighted if obscured by a vehicle in the same combination.

Footnote—4 Any semitrailer or full trailer manufactured on or after March 1, 1979, shall be equipped with rear side—marker lamps at a height of not less than 381 mm (15 inches), and on the rear of trailers not more than 1,524 mm (60 inches) above the road surface, as measured from the center of the lamp on the vehicle at curb weight.

Footnote—5 Each converter dolly, when towed singly by another vehicle and not as part of a full trailer, shall be equipped with one stop lamp, one tail lamp, and two reflectors (one on each side of the vertical centerline, as far apart as practicable) on the rear. Each converter dolly shall be equipped with rear turn signals and vehicular hazard warning signal flasher lamps when towed singly by another vehicle and not as part of a full trailer, if the converter dolly obscures the turn signals at the rear of the towing vehicle.

Footnote—6 Pole trailers shall be equipped with two reflex reflectors on the rear, one on each side of the vertical centerline as far apart as practicable, to indicate the extreme width of the trailer.

Footnote—7 Pole trailers, when towed by motor vehicles with rear identification lamps meeting the requirements of §393.11 and mounted at a height greater

Vehicle Maintenance Pro

than the load being transported on the pole trailer, are not required to have rear identification lamps.

Footnote—8 Pole trailers shall have on the rearmost support for the load: (1) two front clearance lamps, one on each side of the vehicle, both on the same level and as high as practicable to indicate the overall width of the pole trailer; (2) two rear clearance lamps, one on each side of the vehicle, both on the same level and as high as practicable to indicate the overall width of the pole trailer; (3) two rear side marker lamps, one on each side of the vehicle, both on the same level, not less than 375 mm (15 inches) above the road surface; (4) two rear reflex reflectors, one on each side, both on the same level, not less than 375 mm (15 inches) above the road surface to indicate maximum width of the pole trailer; and (5) one red reflector on each side of the rearmost support for the load. Lamps and reflectors may be combined as allowed in §393.22.

Footnote—9 Any motor vehicle transporting a load which extends more than 102 mm (4 inches) beyond the overall width of the motor vehicle shall be equipped with the following lamps in addition to other required lamps when operated during the hours when headlamps are required to be used.

(1) The foremost edge of that portion of the load which projects beyond the side of the vehicle shall be marked (at its outermost extremity) with an amber lamp visible from the front and side.

(2) The rearmost edge of that portion of the load which projects beyond the side of the vehicle shall be marked (at its outermost extremity) with a red lamp visible from the rear and side.

(3) If the projecting load does not measure more than 914 mm (3 feet) from front to rear, it shall be marked with an amber lamp visible from the front, both sides, and rear, except that if the projection is located at or near the rear it shall be marked by a red lamp visible from front, side, and rear.

Footnote—10 Projections beyond rear of motor vehicles. Motor vehicles transporting loads which extend more than 1,219 mm (4 feet) beyond the rear of the motor vehicle, or which have tailboards or tailgates extending more than 1,219 mm (4 feet) beyond the body, shall have these projections marked as follows when the vehicle is operated during the hours when headlamps are required to be used:

(1) On each side of the projecting load, one red side marker lamp, visible from the side, located so as to indicate maximum overhang.

(2) On the rear of the projecting load, two red lamps, visible from the rear, one at each side; and two red reflectors visible from the rear, one at each side, located so as to indicate maximum width.

Footnote—11 To be illuminated when tractor headlamps are illuminated.

Footnote—12 Every bus, truck, and truck tractor shall be equipped with a signaling system that, in addition to signaling turning movements, shall have a switch or combination of switches that will cause the two front turn signals and the two rear signals to flash simultaneously as a vehicular traffic signal warning, required by

§392.22(a). The system shall be capable of flashing simultaneously with the ignition of the vehicle on or off.

Footnote—13 To be actuated upon application of service brakes.

Footnote—14 Backup lamp required to operate when bus, truck, or truck tractor is in reverse.

Footnote—15

(1) For the purposes of §393.11, the term “overall width” refers to the nominal design dimension of the widest part of the vehicle, exclusive of the signal lamps, marker lamps, outside rearview mirrors, flexible fender extensions, and mud flaps.

(2) Clearance lamps may be mounted at a location other than on the front and rear if necessary to indicate the overall width of a vehicle, or for protection from damage during normal operation of the vehicle.

(3) On a trailer, the front clearance lamps may be mounted at a height below the extreme height if mounting at the extreme height results in the lamps failing to mark the overall width of the trailer.

(4) On a truck tractor, clearance lamps mounted on the cab may be located to indicate the width of the cab, rather than the width of the vehicle.

(5) When the rear identification lamps are mounted at the extreme height of a vehicle, rear clearance lamps are not required to be located as close as practicable to the top of the vehicle.

Footnote—16 A trailer subject to this part that is less than 1829 mm (6 feet) in overall length, including the trailer tongue, need not be equipped with front side marker lamps and front side reflex reflectors.

Footnote—17 A boat trailer subject to this part whose overall width is 2032 mm (80 inches) or more need not be equipped with both front and rear clearance lamps provided an amber (front) and red (rear) clearance lamp is located at or near the midpoint on each side so as to indicate its extreme width.

§393.13 Retroreflective sheeting and reflex reflectors, requirements for semitrailers and trailers manufactured before December 1, 1993.

(a) **Applicability.** All trailers and semitrailers manufactured prior to December 1, 1993, which have an overall width of 2,032 mm (80 inches) or more and a gross vehicle weight rating of 4,536 kg (10,001 pounds) or more, except trailers that are manufactured exclusively for use as offices or dwellings, pole trailers (as defined in §390.5 of this subchapter), and trailers transported in a driveaway-towaway operation, must be equipped with retroreflective sheeting or an array of reflex reflectors that meet the requirements of this section. Motor carriers operating trailers, other than container chassis (as defined in §393.5), have until June 1, 2001, to comply with the requirements of this section. Motor carriers operating container chassis have until December 1, 2001, to comply with the requirements of this section.

(b) **Retroreflective sheeting and reflex reflectors.** Motor carriers are encouraged to retrofit their trailers with a conspicuity system that meets all of the requirements applicable to trailers manufactured on or after December 1, 1993, including the use of retroreflective sheeting or reflex reflectors in a red and white pattern (see Federal Motor Vehicle Safety Standard No. 108 (49 CFR 571.108), S5.7, Conspicuity systems). Motor carriers which do not retrofit their trailers to meet the requirements of FMVSS No. 108, for example by using an alternative color pattern, must comply with the remainder of this paragraph and with paragraph (c) or (d) of this section. Retroreflective sheeting or reflex reflectors in colors or color combinations other than red and white may be used on the sides or lower rear area of the semitrailer or trailer until June 1, 2009. The alternate color or color combination must be uniform along the sides and lower rear area of the trailer. The retroreflective sheeting or reflex reflectors on the upper rear area of the trailer must be white and conform to the requirements of FMVSS No. 108 (S5.7). Red retroreflective sheeting or reflex reflectors shall not be used along the sides of the trailer unless it is used as part of a red and white pattern. Retroreflective sheeting shall have a width of at least 50 mm (2 inches).

(c) **Locations for retroreflective sheeting.**

(1) **Sides.** Retroreflective sheeting shall be applied to each side of the trailer or semitrailer. Each strip of retroreflective sheeting shall be positioned as horizontally as practicable, beginning and ending as close to the front and rear as practicable. The strip need not be continuous but the sum of the length of all of the segments shall be at least half of the length of the trailer and the spaces between the segments of the strip shall be distributed as evenly as practicable. The centerline for each strip of retroreflective sheeting shall be between 375 mm (15 inches) and 1,525 mm (60 inches) above the road surface when measured with the trailer empty or unladen, or as close as practicable to this area. If necessary to clear rivet heads or other similar obstructions, 50 mm (2 inches) wide retroreflective sheeting may be separated into two 25 mm (1 inch) wide strips of the

same length and color, separated by a space of not more than 25 mm (1 inch).

(2) **Lower rear area.** The rear of each trailer and semitrailer must be equipped with retroreflective sheeting. Each strip of retroreflective sheeting shall be positioned as horizontally as practicable, extending across the full width of the trailer, beginning and ending as close to the extreme edges as practicable. The centerline for each of the strips of retroreflective sheeting shall be between 375 mm (15 inches) and 1,525 mm (60 inches) above the road surface when measured with the trailer empty or unladen, or as close as practicable to this area.

(3) **Upper rear area.** Two pairs of white strips of retroreflective sheeting, each pair consisting of strips 300 mm (12 inches) long, must be positioned horizontally and vertically on the right and left upper corners of the rear of the body of each trailer and semitrailer, as close as practicable to the top of the trailer and as far apart as practicable. If the perimeter of the body, as viewed from the rear, is not square or rectangular, the strips may be applied along the perimeter, as close as practicable to the uppermost and outermost areas of the rear of the body on the left and right sides.

(d) **Locations for reflex reflectors.**

(1) **Sides.** Reflex reflectors shall be applied to each side of the trailer or semitrailer. Each array of reflex reflectors shall be positioned as horizontally as practicable, beginning and ending as close to the front and rear as practicable. The array need not be continuous but the sum of the length of all of the array segments shall be at least half of the length of the trailer and the spaces between the segments of the strip shall be distributed as evenly as practicable. The centerline for each array of reflex reflectors shall be between 375 mm (15 inches) and 1,525 mm (60 inches) above the road surface when measured with the trailer empty or unladen, or as close as practicable to this area. The center of each reflector shall not be more than 100 mm (4 inches) from the center of each adjacent reflector in the segment of the array. If reflex reflectors are arranged in an alternating color pattern, the length of reflectors of the first color shall be as close as practicable to the length of the reflectors of the second color.

(2) **Lower rear area.** The rear of each trailer and semitrailer must be equipped with reflex reflectors. Each array of reflex reflectors shall be positioned as horizontally as practicable, extending across the full width of the trailer, beginning and ending as close to the extreme edges as practicable. The centerline for each array of reflex reflectors shall be between 375 mm (15 inches) and 1,525 mm (60 inches) above the road surface when measured with the trailer empty or unladen, or as close as practicable to this area. The center of each reflector shall not be more than 100 mm (4 inches) from the center of each adjacent reflector in the segment of the array.

(3) **Upper rear area.** Two pairs of white reflex reflector arrays, each pair at least 300 mm (12 inches) long, must be positioned horizontally and vertically on the right and left upper corners of the rear of the body of each trailer and semitrailer, as close as practicable to

Regulations

the top of the trailer and as far apart as practicable. If the perimeter of the body, as viewed from the rear, is not square or rectangular, the arrays may be applied along the perimeter, as close as practicable to the uppermost and outermost areas of the rear of the body on the left and right sides. The center of each reflector shall not be more than 100 mm (4 inches) from the center of each adjacent reflector in the segment of the array.

§393.17 Lamps and reflectors-combinations in driveaway-towaway operation.

A combination of motor vehicles engaged in driveaway-tow-away operation must be equipped with operative lamps and reflectors conforming to the rules in this section.

(a) The towing vehicle must be equipped as follows:

(1) On the front, there must be at least two headlamps, an equal number at each side, two turn signals, one at each side, and two clearance lamps, one at each side.

(2) On each side, there must be at least one side-marker lamp, located near the front of the vehicle.

(3) On the rear, there must be at least two tail lamps, one at each side, and two stop lamps, one at each side.

(b) Except as provided in paragraph (c) of this section, the rearmost towed vehicle of the combination (including the towed vehicles of a tow-bar combination, the towed vehicle of a single saddle-mount combination, and the rearmost towed vehicle of a double or triple saddle-mount combination) or, in the case of a vehicle full-mounted on a saddle-mount vehicle, either the full-mounted vehicle or the rearmost saddle-mounted vehicle must be equipped as follows:

(1) On each side, there must be at least one side-marker lamp, located near the rear of the vehicle.

(2) On the rear, there must be at least two tail lamps, two stop lamps, two turn signals, two clearance lamps, and two reflectors, one of each type at each side. In addition, if any vehicle in the combination is 80 inches or more in overall width, there must be three identification lamps on the rear.

(c) If the towed vehicle in a combination is a mobile structure trailer, it must be equipped in accordance with the following lighting devices. For the purposes of this part, "mobile structure trailer" means a trailer that has a roof and walls, is at least 10 feet wide, and can be used off road for dwelling or commercial purposes.

(1) When the vehicle is operated in accordance with the terms of a special permit prohibiting operation during the times when lighted lamps are required under §392.30, it must have on the rear—

(i) Two stop lamps, one on each side of the vertical centerline, at the same height, and as far apart as practicable;

(ii) Two tail lamps, one on each side of the vertical centerline, at the same height, and as far apart as practicable;

(iii) Two red reflex reflectors, one on each side of the vertical centerline, at the same height, and as far apart as practicable; and

(iv) Two turn signal lamps, one on each side of the vertical centerline, at the same height, and as far apart as practicable.

(2) At all other times, the vehicle must be equipped as specified in paragraph (b) of this section.

(d) An intermediate towed vehicle in a combination consisting of more than two vehicles (including the first saddle-mounted vehicle of a double saddle-mount combination and the first and second saddle-mount vehicles of a triple saddle-mount combination) must have one side-marker lamp on each side, located near the rear of the vehicle.

Figure 19 Single-Saddle-Mount Diagram to Illustrate § 393.17

Figure 20 Double-Saddle-Mount Diagram to Illustrate § 393.17

Vehicle Maintenance Pro

Figure 21 Tow-bar Diagram to Illustrate § 393.17

§393.19 Hazard warning signals.

The hazard warning signal operating unit on each commercial motor vehicle shall operate independently of the ignition or equivalent switch, and when activated, cause all turn signals required by §393.11 to flash simultaneously.

§393.20 [Reserved]

§393.22 Combination of lighting devices and reflectors.

(a) **Permitted combinations.** Except as provided in paragraph (b) of this section, two or more lighting devices and reflectors (whether or not required by the rules in this part) may be combined optically if—

(1) Each required lighting device and reflector conforms to the applicable rules in this Part; and

(2) Neither the mounting nor the use of a nonrequired lighting device or reflector impairs the effectiveness of a required lighting device or reflector or causes that device or reflector to be inconsistent with the applicable rules in this Part.

(b) **Prohibited combinations.** (1) A turn signal lamp must not be combined optically with either a head lamp or other lighting device or combination of lighting devices that produces a greater intensity of light than the turn signal lamp;

(2) A turn signal lamp must not be combined optically with a stop lamp unless the stop lamp function is always deactivated when the turn signal function is activated;

(3) A clearance lamp must not be combined optically with a tail lamp or identification lamp.

§393.23 Power supply for lamps.

All required lamps must be powered by the electrical system of the motor vehicle with the exception of battery powered lamps used on projecting loads.

§393.24 Requirement for head lamps, auxiliary driving lamps and front fog lamps.

(a) **Headlamps.** Every bus, truck and truck tractor shall be equipped with headlamps as required by §393.11(a). The head-lamps shall provide an upper and lower beam distribution of light, selectable at the driver's will and be steady-burning. The headlamps shall be marked in accordance with FMVSS No. 108. Auxiliary driving lamps and/or front fog lamps may not be used to satisfy the requirements of this paragraph.

(b) **Auxiliary driving lamps and front fog lamps.** Commercial motor vehicles may be equipped with auxiliary driving lamps and/or front fog lamps for use in conjunction with, but not in lieu of the required headlamps. Auxiliary driving lamps shall meet SAE Standard J581 Auxiliary Upper Beam Lamps, July 2004, and front fog lamps shall meet SAE Standard J583 Front Fog Lamp, August 2004. (See §393.7 for information on the incorporation by reference and availability of these documents.)

(c) **Mounting.** Headlamps shall be mounted and aimable in accordance with FMVSS No. 108. Auxiliary driving lamps and front fog lamps shall be mounted so that the beams are aimable and the mounting shall prevent the aim of the lighting device from being disturbed while the vehicle is operating on public roads.

(d) **Aiming.** Headlamps, auxiliary driving lamps and front fog lamps shall be aimed to meet the aiming specifications in FMVSS No. 108 (49 CFR 571.108), SAE J581, and SAE J583, respectively.

§393.25 Requirements for lamps other than head lamps.

(a) **Mounting.** All lamps shall be securely mounted on a rigid part of the vehicle. Temporary lamps must be securely mounted to the load and are not required to be mounted to a permanent part of the vehicle.

(b) **Visibility.** Each lamp shall be located so that it meets the visibility requirements specified by FMVSS No. 108 in effect at the time of manufacture of the vehicle. Vehicles which were not subject to FMVSS No. 108 at the time of manufacture shall have each lamp located so that it meets the visibility requirements specified in the SAE standards listed in paragraph (c) of this section. If motor vehicle equipment (e.g., mirrors, snow plows, wrecker booms, backhoes, and winches) prevents compliance with this paragraph by any required lamp, an auxiliary lamp or device meeting the requirements of this paragraph shall be provided. This shall not be construed to apply to lamps on one unit which are obscured by another unit of a combination of vehicles.

(c) **Specifications.** All required lamps (except marker lamps on projecting loads, lamps which are temporarily attached to vehicles transported in driveaway-towaway operations, and lamps on converter dollies and pole trailers) on vehicles manufactured on or after December 25, 1968, shall, at a minimum, meet the applicable requirements of FMVSS No. 108 in effect on the date of manufacture of the vehicle. Marker lamps on projecting loads, all lamps which are temporarily attached to vehicles transported in driveaway-towaway operations, and all lamps on converter dollies and pole

Regulations

trailers must meet the following applicable SAE standards: J586-Stop Lamps for Use on Motor Vehicles Less Than 2032 mm in Overall Width, March 2000; J2261 Stop Lamps and Front- and Rear-Turn Signal Lamps for Use on Motor Vehicles 2032 mm or More in Overall Width, January 2002; J585-Tail Lamps (Rear Position Lamps) for Use on Motor Vehicles Less Than 2032 mm in Overall Width, March 2000; J588-Turn Signal Lamps for Use on Motor Vehicles Less Than 2032 mm in Overall Width, March 2000; J2040-Tail Lamps (Rear Position Lamps) for Use on Vehicles 2032 mm or More in Overall Width, March 2002; J592-Sidemarkers Lamps for Use on Road Vehicles Less Than 2032 mm in Overall Width, August 2000. (See §393.7 for information on the incorporation by reference and availability of these documents.)

(d) (Reserved)

(e) Lamps to be steady-burning. All exterior lamps (both required lamps and any additional lamps) shall be steady-burning with the exception of turn signal lamps; hazard warning signal lamps; school bus warning lamps; amber warning lamps or flashing warning lamps on tow trucks and commercial motor vehicles transporting oversized loads; and warning lamps on emergency and service vehicles authorized by State or local authorities. Lamps combined into the same shell or housing with a turn signal are not required to be steady burning while the turn signal is in use. Amber warning lamps must meet SAE J845-Optical Warning Devices for Authorized Emergency, Maintenance and Service Vehicles, May 1997. Amber flashing warning lamps must meet SAE J595-Directional Flashing Optical Warning Devices for Authorized Emergency, Maintenance and Service Vehicles, January 2005. Amber gaseous discharge warning lamps must meet SAE J1318 Gaseous Discharge Warning Lamp for Authorized Emergency, Maintenance, and Service Vehicles, May 1998. (See §393.7(b) for information on the incorporation by reference and availability of these documents.)

(f) Stop lamp operation. The stop lamps on each vehicle shall be activated upon application of the service brakes. The stop lamps are not required to be activated when the emergency feature of the trailer brakes is used or when the stop lamp is optically combined with the turn signal and the turn signal is in use.

§393.26 Requirements for reflex reflectors.

(a) Mounting. Reflex reflectors shall be mounted at the locations required by §393.11. In the case of motor vehicles so constructed that requirement for a 381 mm (15-inch) minimum height above the road surface is not practical, the reflectors shall be mounted as close as practicable to the required mounting height range. All permanent reflex reflectors shall be securely mounted on a rigid part of the vehicle. Temporary reflectors on projecting loads must be securely mounted to the load and are not required to be permanently mounted to a part of the vehicle. Temporary reflex reflectors on vehicles transported in drive-away-towaway operations must be firmly attached.

(b) Specifications. All required reflex reflectors (except reflex reflectors on projecting loads, vehicles transported in a driveaway-towaway operation, con-

verter dollies and pole trailers) on vehicles manufactured on or after December 25, 1968, shall meet the applicable requirements of FMVSS No. 108 in effect on the date of manufacture of the vehicle. Reflex reflectors on projecting loads, vehicles transported in a driveaway-tow-away operation, and all reflex reflectors on converter dollies and pole trailers must conform to SAE J594-Reflex Reflectors, December 2003.

(c) Substitute material for side reflex reflectors. Reflective material conforming to ASTM D 4956-04, Standard Specification for Retroreflective Sheeting for Traffic Control, may be used in lieu of reflex reflectors if the material as used on the vehicle, meets the performance standards in either Table I of SAE J594 or Table IA of SAE J594-Reflex Reflectors, December 2003. (See §393.7(b) for information on the incorporation by reference and availability of these documents.)

(d) Use of additional retroreflective surfaces. Additional retroreflective surfaces may be used in conjunction with, but not in lieu of the reflex reflectors required in subpart B of part 393, and the substitute material for side reflex reflectors allowed by paragraph (c) of this section, provided:

(1) Designs do not resemble traffic control signs, lights, or devices, except that straight edge striping resembling a barricade pattern may be used.

(2) Designs do not tend to distort the length and/or width of the motor vehicle.

(3) Such surfaces shall be at least 3 inches from any required lamp or reflector unless of the same color as such lamp or reflector.

(4) No red color shall be used on the front of any motor vehicle, except for display of markings or placards required by §177.823 of this title.

(5) Retroreflective license plates required by State or local authorities may be used.

§393.27 [Reserved]

§393.28 Wiring systems.

Electrical wiring shall be installed and maintained to conform to SAE J1292-Automobile, Truck, Truck-Tractor, Trailer, and Motor Coach Wiring, October 1981, except the jumper cable plug and receptacle need not conform to SAE J560. The reference to SAE J1292 shall not be construed to require circuit protection on trailers. (See §393.7(b) for information on the incorporation by reference and availability of this document.)

§393.29 [Reserved]

§393.30 Battery installation.

Every storage battery on every vehicle, unless located in the engine compartment, shall be covered by a fixed part of the motor vehicle or protected by a removable cover or enclosure. Removable covers, or enclosures shall be substantial and shall be securely latched or fastened. The storage battery compartment and adjacent metal parts which might corrode by reason of battery leakage shall be painted or coated with an acid-resisting paint or coating and shall have openings to provide ample battery ventilation and drainage. Whenever the cable to the starting motor passes through a

Vehicle Maintenance Pro

metal compartment, the cable shall be protected against grounding by an acid and waterproof insulating bushing. Wherever a battery and a fuel tank are both placed under the driver's seat, they shall be partitioned from each other, and each compartment shall be provided with an independent cover, ventilation, and drainage.

§§393.31–393.33 [Reserved]

Subpart C—Brakes

§393.40 Required brake systems.

(a) Each commercial motor vehicle must have brakes adequate to stop and hold the vehicle or combination of motor vehicles. Each commercial motor vehicle must meet the applicable service, parking, and emergency brake system requirements provided in this section.

(b) **Service brakes.** (1) **Hydraulic brake systems.** Motor vehicles equipped with hydraulic brake systems and manufactured on or after September 2, 1983, must, at a minimum, have a service brake system that meets the requirements of FMVSS No. 105 in effect on the date of manufacture. Motor vehicles which were not subject to FMVSS No. 105 on the date of manufacture must have a service brake system that meets the applicable requirements of §§393.42, 393.48, 393.49, 393.51, and 393.52 of this subpart.

(2) **Air brake systems.** Buses, trucks and truck tractors equipped with air brake systems and manufactured on or after March 1, 1975, and trailers manufactured on or after January 1, 1975, must, at a minimum, have a service brake system that meets the requirements of FMVSS No. 121 in effect on the date of manufacture. Motor vehicles which were not subject to FMVSS No. 121 on the date of manufacture must have a service brake system that meets the applicable requirements of §§393.42, 393.48, 393.49, 393.51, and 393.52 of this subpart.

(3) **Vacuum brake systems.** Motor vehicles equipped with vacuum brake systems must have a service brake system that meets the applicable requirements of §§393.42, 393.48, 393.49, 393.51, and 393.52 of this subpart.

(4) **Electric brake systems.** Motor vehicles equipped with electric brake systems must have a service brake system that meets the applicable requirements of §§393.42, 393.48, 393.49, 393.51, and 393.52 of this subpart.

(5) **Surge brake systems.** Motor vehicles equipped with surge brake systems must have a service brake system that meets the applicable requirements of §§393.42, 393.48, 393.49, and 393.52 of this subpart.

(c) **Parking brakes.** Each commercial motor vehicle must be equipped with a parking brake system that meets the applicable requirements of §393.41.

(d) **Emergency brakes—partial failure of service brakes.**

(1) **Hydraulic brake systems.** Motor vehicles manufactured on or after September 2, 1983, and equipped with a split service brake system must, at a minimum, meet the partial failure requirements of FMVSS No. 105 in effect on the date of manufacture.

(2) **Air brake systems.** Buses, trucks and truck tractors manufactured on or after March 1, 1975, and trailers manufactured on or after January 1, 1975, must be equipped with an emergency brake system which, at a minimum, meets the requirements of FMVSS No. 121 in effect on the date of manufacture.

(3) **Vehicles not subject to FMVSS Nos. 105 and 121 on the date of manufacture.** Buses, trucks and truck tractors not subject to FMVSS Nos. 105 or 121 on the date of manufacture must meet the requirements of §393.40(e). Trailers not subject to FMVSS No. 121 at the time of manufacture must meet the requirements of §393.43.

(e) **Emergency brakes, vehicles manufactured on or after July 1, 1973.** (1) A bus, truck, truck tractor, or a combination of motor vehicles manufactured on or after July 1, 1973, and not covered under paragraphs (d)(1) or (d)(2) of this section, must have an emergency brake system which consists of emergency features of the service brake system or an emergency system separate from the service brake system. The emergency brake system must meet the applicable requirements of §§393.43 and 393.52.

(2) A control by which the driver applies the emergency brake system must be located so that the driver can operate it from the normal seating position while restrained by any seat belts with which the vehicle is equipped. The emergency brake control may be combined with either the service brake control or the parking brake control. However, all three controls may not be combined.

(f) **Interconnected systems.** (1) If the brake systems required by §393.40(a) are interconnected in any way, they must be designed, constructed, and maintained so that in the event of a failure of any part of the operating mechanism of one or more of the systems (except the service brake actuation pedal or valve), the motor vehicle will have operative brakes and, for vehicles manufactured on or after July 1, 1973, be capable of meeting the requirements of §393.52(b).

(2) A motor vehicle to which the requirements of FMVSS No. 105 (S5.1.2), dealing with partial failure of the service brake, applied at the time of manufacture meets the requirements of §393.40(f)(1) if the motor vehicle is maintained in conformity with FMVSS No. 105 and the motor vehicle is capable of meeting the requirements of §393.52(b), except in the case of a structural failure of the brake master cylinder body.

(3) A bus is considered to meet the requirements of §393.40(f)(1) if it meets the requirements of §393.44 and §393.52(b).

§393.41 Parking brake system.

(a) **Hydraulic-braked vehicles manufactured on or after September 2, 1983.** Each truck and bus (other than a school bus) with a GVWR of 4,536 kg (10,000 pounds) or less which is subject to this part and school buses with a GVWR greater than 4,536 kg (10,000 pounds) shall be equipped with a parking brake system as required by FMVSS No. 571.105 (S5.2) in effect at the time of manufacture. The parking brake shall be capable of holding the vehicle or combination of vehicles

Regulations

stationary under any condition of loading in which it is found on a public road (free of ice and snow). Hydraulic-braked vehicles which were not subject to the parking brake requirements of FMVSS No. 571.105 (S5.2) must be equipped with a parking brake system that meets the requirements of paragraph (c) of this section.

(b) **Air-braked power units manufactured on or after March 1, 1975, and air-braked trailers manufactured on or after January 1, 1975.** Each air-braked bus, truck and truck tractor manufactured on and after March 1, 1975, and each air-braked trailer except an agricultural commodity trailer, converter dolly, heavy hauler trailer or pulpwood trailer, shall be equipped with a parking brake system as required by FMVSS No. 121 (S5.6) in effect at the time of manufacture. The parking brake shall be capable of holding the vehicle or combination of vehicles stationary under any condition of loading in which it is found on a public road (free of ice and snow). An agricultural commodity trailer, heavy hauler or pulpwood trailer shall carry sufficient chocking blocks to prevent movement when parked.

(c) **Vehicles not subject to FMVSS Nos. 105 and 121 on the date of manufacture.** (1) Each singly driven motor vehicle not subject to parking brake requirements of FMVSS Nos. 105 or 121 at the time of manufacture, and every combination of motor vehicles must be equipped with a parking brake system adequate to hold the vehicle or combination on any grade on which it is operated, under any condition of loading in which it is found on a public road (free of ice and snow).

(2) The parking brake system shall, at all times, be capable of being applied by either the driver's muscular effort or by spring action. If other energy is used to apply the parking brake, there must be an accumulation of that energy isolated from any common source and used exclusively for the operation of the parking brake.

Exception: This paragraph shall not be applicable to air-applied, mechanically-held parking brake systems which meet the parking brake requirements of FMVSS No. 121 (S5.6).

(3) The parking brake system shall be held in the applied position by energy other than fluid pressure, air pressure, or electric energy. The parking brake system shall not be capable of being released unless adequate energy is available to immediately reapply the parking brake with the required effectiveness.

§393.42 Brakes required on all wheels.

(a) Every commercial motor vehicle shall be equipped with brakes acting on all wheels. This requirement also applies to certain motor vehicles being towed in a driveaway-towaway operation, as follows:

(1) Any motor vehicle towed by means of a tow-bar when another motor vehicle is full-mounted on the towed vehicle; and

(2) Any saddle-mount configuration with a fullmount.

(b) **Exception.**

(1) Trucks or truck tractors having three or more axles and manufactured before July 25, 1980, are not required to have brakes on the front wheels. However, these vehicles must meet the requirements of §393.52.

(2) Motor vehicles being towed in a driveaway-towaway operation (including the last truck of triple saddle-mount combinations (see §393.71(a)(3)) are not required to have operative brakes provided the combination of vehicles meets the requirements of §393.52.

(3) Any semitrailer or pole trailer (laden or unladen) with a gross weight of 1,361 kg (3,000 pounds) or less which is subject to this part is not required to be equipped with brakes if the axle weight of the towed vehicle does not exceed 40 percent of the sum of the axle weights of the towing vehicle.

(4) Any full trailer or four-wheel pole trailer (laden or unladen) with a gross weight of 1,361 kg (3,000 pounds) or less which is subject to this part is not required to be equipped with brakes if the sum of the axle weights of the towed vehicle does not exceed 40 percent of the sum of the axle weights of the towing vehicle.

(5) Brakes are not required on the steering axle of a three-axle dolly which is steered by a co-driver.

(6) Loaded housemoving dollies, specialized trailers and dollies used to transport industrial furnaces, reactors, and similar motor vehicles are not required to be equipped with brakes, provided the speed at which the combination of vehicles will be operated does not exceed 32 km/hour (20 mph) and brakes on the combination of vehicles are capable of stopping the combination within 12.2 meters (40 feet) from the speed at which the vehicle is being operated or 32 km/hour (20 mph), whichever is less.

Figure 22-Illustrations of Brake Requirements for Light-Duty Trailers in §393.42

§393.43 Breakaway and emergency braking.

(a) **Towing vehicle protection system.** Every motor vehicle, if used to tow a trailer equipped with brakes, shall be equipped with a means for providing that in the case of a breakaway of the trailer, the service brakes on the towing vehicle will be capable of stopping the towing vehicle. For air braked towing units, the tractor protection valve or similar device shall operate automatically when the air pressure on the towing vehicle is between 138 kPa and 310 kPa (20 psi and 45 psi).

(b) **Emergency brake requirements, air brakes.** Every truck or truck tractor equipped with air brakes,

Vehicle Maintenance Pro

when used for towing other vehicles equipped with air brakes, shall be equipped with two means of activating the emergency features of the trailer brakes. One of these means shall operate automatically in the event of reduction of the towing vehicle air supply to a fixed pressure which shall not be lower than 20 pounds per square inch nor higher than 45 pounds per square inch. The other means shall be a manually controlled device readily operable by a person seated in the driving seat. Its emergency position or method of operation shall be clearly indicated. In no instance may the manual means be so arranged as to permit its use to prevent operation of the automatic means. The automatic and manual means required by this section may be, but are not required to be, separate.

(c) **Emergency brake requirements, vacuum brakes.** Every truck tractor and truck when used for towing other vehicles equipped with vacuum brakes, shall have, in addition to the single control required by §393.49 to operate all brakes of the combination, a second manual control device which can be used to operate the brakes on the towed vehicles in emergencies. Such second control shall be independent of brake air, hydraulic, and other pressure, and independent of other controls, unless the braking system be so arranged that failure of the pressure on which the second control depends will cause the towed vehicle brakes to be applied automatically. The second control is not required by this rule to provide modulated or graduated braking.

(d) **Breakaway braking requirements for trailers.** Every trailer required to be equipped with brakes shall have brakes which apply automatically and immediately upon breakaway from the towing vehicle. With the exception of trailers having three or more axles, all brakes with which the trailer is required to be equipped must be applied upon breakaway from the towing vehicle. The brakes must remain in the applied position for at least 15 minutes.

(e) **Emergency valves.** Air brake systems installed on towed vehicles shall be so designed, by the use of “no-bleed-back” relay emergency valves or equivalent devices, that the supply reservoir used to provide air for brakes shall be safeguarded against backflow of air to the towing vehicle upon reduction of the towing vehicle air pressure.

(f) **Exception.** The requirements of paragraphs (b), (c) and (d) of this section shall not be applicable to commercial motor vehicles being transported in driveaway-towaway operations.

§393.44 Front brake lines, protection.

On every bus, if equipped with air brakes, the braking system shall be so constructed that in the event any brake line to any of the front wheels is broken, the driver can apply the brakes on the rear wheels despite such breakage. The means used to apply the brakes may be located forward of the driver’s seat as long as it can be operated manually by the driver when the driver is properly restrained by any seat belt assembly provided for use. Every bus shall meet this requirement or comply with the regulations in effect at the time of its manufacture.

§393.45 Brake tubing and hoses; hose assemblies and end fittings.

(a) **General construction requirements for tubing and hoses, assemblies, and end fittings.** All brake tubing and hoses, brake hose assemblies, and brake hose end fittings must meet the applicable requirements of FMVSS No. 106 (49 CFR 571.106).

(b) **Brake tubing and hose installation.** Brake tubing and hose must—

(1) Be long and flexible enough to accommodate without damage all normal motions of the parts to which it is attached;

(2) Be secured against chaffing, kinking, or other mechanical damage; and

(3) Be installed in a manner that prevents it from contacting the vehicle’s exhaust system or any other source of high temperatures.

(c) **Nonmetallic brake tubing.** Coiled nonmetallic brake tubing may be used for connections between towed and towing motor vehicles or between the frame of a towed vehicle and the unsprung subframe of an adjustable axle of the motor vehicle if—

(1) The coiled tubing has a straight segment (pigtail) at each end that is at least 51 mm (2 inches) in length and is encased in a spring guard or similar device which prevents the tubing from kinking at the fitting at which it is attached to the vehicle; and

(2) The spring guard or similar device has at least 51 mm (2 inches) of closed coils or similar surface at its interface with the fitting and extends at least 38 mm (1 ½ inches) into the coiled segment of the tubing from its straight segment.

(d) **Brake tubing and hose connections.** All connections for air, vacuum, or hydraulic braking systems shall be installed so as to ensure an attachment free of leaks, constrictions or other conditions which would adversely affect the performance of the brake system.

§393.46 [Reserved]

§393.47 Brake actuators, slack adjusters, linings/pads, and drums/rotors.

(a) **General requirements.** Brake components must be constructed, installed and maintained to prevent excessive fading and grabbing. The means of attachment and physical characteristics must provide for safe and reliable stopping of the commercial motor vehicle.

(b) **Brake chambers.** The service brake chambers and spring brake chambers on each end of an axle must be the same size.

(c) **Slack adjusters.** The effective length of the slack adjuster on each end of an axle must be the same.

(d) **Linings and pads.** The thickness of the brake linings or pads shall meet the applicable requirements

Regulations

of this paragraph—

(1) **Steering axle brakes.** The brake lining/pad thickness on the steering axle of a truck, truck-tractor or bus shall not be less than 4.8 mm ($\frac{3}{16}$ inch) at the shoe center for a shoe with a continuous strip of lining; less than 6.4 mm ($\frac{1}{4}$ inch) at the shoe center for a shoe with two pads; or worn to the wear indicator if the lining is so marked, for air drum brakes. The steering axle brake lining/pad thickness shall not be less than 3.2 mm ($\frac{1}{8}$ inch) for air disc brakes, or 1.6 mm ($\frac{1}{16}$ inch) or less for hydraulic disc, drum and electric brakes.

(2) **Non-steering axle brakes.** An air braked commercial motor vehicle shall not be operated with brake lining/pad thickness less than 6.4 mm ($\frac{1}{4}$ inch) or to the wear indicator if the lining is so marked (measured at the shoe center for drum brakes); or less than 3.2 mm ($\frac{1}{8}$ inch) for disc brakes. Hydraulic or electric braked commercial motor vehicles shall not be operated with a lining/pad thickness less than 1.6 mm ($\frac{1}{16}$ inch) (measured at the shoe center) for disc or drum brakes.

(e) **Clamp, Bendix DD-3, bolt-type, and rotochamber brake actuator readjustment limits.**

(1) The pushrod stroke must not be greater than the values specified in the following tables:

CLAMP-TYPE BRAKE CHAMBERS

Type	Outside diameter	Brake readjustment limit: standard stroke chamber	Brake readjustment limit: long stroke chamber
6.....	4 $\frac{1}{2}$ in. (114 mm)	1 $\frac{1}{4}$ in. (31.8 mm).	
9	5 $\frac{1}{4}$ in. (133 mm)	1 $\frac{3}{8}$ in. (34.9 mm).	
12	5 $\frac{1}{16}$ in. (145 mm)	1 $\frac{3}{8}$ in. (34.9 mm).	1 $\frac{3}{4}$ in. (44.5 mm).
16.....	6 $\frac{3}{8}$ in. (162 mm)	1 $\frac{3}{4}$ in. (44.5 mm).	2 in. (50.8 mm).
20	6 $\frac{25}{32}$ in. (172 mm)	1 $\frac{3}{4}$ in. (44.5 mm).	2 in. (50.8 mm). 2 $\frac{1}{2}$ in. (63.5 mm). ¹
24.....	7 $\frac{7}{32}$ in. (184 mm)	1 $\frac{3}{4}$ in. (44.5 mm).	2 in. (50.8 mm). 2 $\frac{1}{2}$ in. (63.5 mm). ²
30.....	8 $\frac{3}{32}$ in. (206 mm)	2 in. (50.8 mm)....	2 $\frac{1}{2}$ in. (63.5 mm).
36.....	9 in. (229 mm).....	2 $\frac{1}{4}$ in. (57.2 mm).	

¹ For type 20 chambers with a 3-inch (76 mm) rated stroke.

² For type 24 chambers with a 3-inch (76 mm) rated stroke.

BENDIX DD-3 BRAKE CHAMBERS

Type	Outside diameter	Brake readjustment limit
30	8 $\frac{1}{8}$ in. (206 mm)	2 $\frac{1}{4}$ in. (57.2 mm).

BOLT-TYPE BRAKE CHAMBERS

Type	Outside diameter	Brake readjustment limit
A.....	6 $\frac{15}{16}$ in. (176 mm)	1 $\frac{3}{8}$ in. (34.9 mm).
B	9 $\frac{3}{16}$ in. (234 mm)	1 $\frac{3}{4}$ in. (44.5 mm).
C	8 $\frac{1}{16}$ in. (205 mm)	1 $\frac{3}{4}$ in. (44.5 mm)
D	5 $\frac{1}{4}$ in. (133 mm)	1 $\frac{1}{4}$ in. (31.8 mm).
E.....	6 $\frac{3}{16}$ in. (157 mm)	1 $\frac{3}{8}$ in. (34.9 mm).
F.....	11 in. (279 mm)	2 $\frac{1}{4}$ in. (57.2 mm).
G	9 $\frac{7}{8}$ in. (251 mm)	2 in. (50.8 mm).

ROTOCHAMBER-TYPE BRAKE CHAMBERS

Type	Outside diameter	Brake readjustment limit
9	4 $\frac{9}{32}$ in. (109 mm)	1 $\frac{1}{2}$ in. (38.1 mm).
12	4 $\frac{13}{16}$ in. (122 mm)	1 $\frac{1}{2}$ in. (38.1 mm).
16.....	5 $\frac{13}{32}$ in. (138 mm)	2 in. (50.8 mm).
20	5 $\frac{15}{16}$ in. (151 mm)	2 in. (50.8 mm).
24.....	6 $\frac{13}{32}$ in. (163 mm)	2 in. (50.8 mm).
30.....	7 $\frac{1}{16}$ in. (180 mm)	2 $\frac{1}{4}$ in. (57.2 mm).
36.....	7 $\frac{5}{8}$ in. (194 mm)	2 $\frac{3}{4}$ in. (69.9 mm).
50.....	8 $\frac{7}{8}$ in. (226 mm)	3 in. (76.2 mm).

(2) For actuator types not listed in these tables, the pushrod stroke must not be greater than 80 percent of the rated stroke marked on the actuator by the actuator manufacturer, or greater than the readjustment limit marked on the actuator by the actuator manufacturer.

(f) **Wedge Brake Adjustment.** The movement of the scribe mark on the lining shall not exceed 1.6 mm ($\frac{1}{16}$ inch).

(g) **Drums and rotors.** The thickness of the drums or rotors shall not be less than the limits established by the brake drum or rotor manufacturer.

§393.48 Brakes to be operative.

(a) **General rule.** Except as provided in paragraphs (b), (c), and (d) of this section, all brakes with which a motor vehicle is equipped must at all times be capable of operating.

(b) **Devices to reduce or remove front-wheel braking effort.** A commercial motor vehicle may be equipped with a device to reduce the front wheel braking effort (or in the case of a three-axle truck or truck tractor manufactured before March 1, 1975, a device to remove the front-wheel braking effort) if that device meets the applicable requirements of paragraphs (b)(1) and (2) of this section.

(1) **Manually operated devices.** Manually operated devices to reduce or remove front-wheel braking effort may only be used on buses, trucks, and truck tractors manufactured before March 1, 1975. Such devices must not be used unless the vehicle is being operated under adverse conditions such as wet, snowy, or icy roads.

(2) **Automatic devices.** Automatic devices must not reduce the front-wheel braking force by more than 50 percent of the braking force available when the automatic device is disconnected (regardless of whether or not an antilock system failure has occurred on any axle). The device must not be operable by the driver except upon application of the control that activates the braking system. The device must not be operable when the brake control application pressure exceeds 85 psig (for vehicles equipped with air brakes) or 85 percent of the maximum system pressure (for vehicles which are not equipped with air brakes).

(c) **Exception.** Paragraph (a) of this section does not apply to—

(1) A towed vehicle with disabling damage as defined in §390.5;

(2) A vehicle which is towed in a driveway-towaway operation and is included in the exemption to the requirement for brakes on all wheels, §393.42(b);

Vehicle Maintenance Pro

(3) Unladen converter dollies with a gross weight of 1,361 kg (3,000 lbs) or less, and manufactured prior to March 1, 1998;

(4) The steering axle of a three-axle dolly which is steered by a co-driver;

(5) Loaded house moving dollies, specialized trailers and dollies used to transport industrial furnaces, reactors, and similar motor vehicles provided the speed at which the combination of vehicles will be operated does not exceed 32 km/hour (20 mph) and brakes on the combination of vehicles are capable of stopping the combination within 12.2 meters (40 feet) from the speed at which the vehicle is being operated or 32 km/hour (20 mph), whichever is less.

(6) **Raised lift axles.** Brakes on lift axles need not be capable of being operated while the lift axle is raised. However, brakes on lift axles must be capable of being applied whenever the lift axle is lowered and the tires contact the roadway.

(d) **Surge brakes.** (1) Surge brakes are allowed on:

(i) Any trailer with a gross vehicle weight rating (GVWR) of 12,000 pounds or less, when its GVWR does not exceed 1.75 times the GVWR of the towing vehicle; and

(ii) Any trailer with a GVWR greater than 12,000 pounds, but less than 20,001 pounds, when its GVWR does not exceed 1.25 times the GVWR of the towing vehicle.

(2) The gross vehicle weight (GVW) of a trailer equipped with surge brakes may be used instead of its GVWR to calculate compliance with the weight ratios specified in paragraph (d)(1) of this section when the trailer manufacturer's GVWR label is missing.

(3) The GVW of a trailer equipped with surge brakes must be used to calculate compliance with the weight ratios specified in paragraph (d)(1) of this section when the trailer's GVW exceeds its GVWR.

(4) The surge brakes must meet the requirements of §393.40.

§393.49 Control valves for brakes.

(a) **General rule.** Except as provided in paragraphs (b) and (c) of this section, every motor vehicle manufactured after June 30, 1953, which is equipped with power brakes, must have the braking system so arranged that one application valve must when activated cause all of the service brakes on the motor vehicle or combination motor vehicle to operate. This requirement must not be construed to prohibit motor vehicles from being equipped with an additional valve to be used to operate the brakes on a trailer or trailers or as required for buses in §393.44.

(b) **Driveaway-towaway exception.** This section is not applicable to driveaway-towaway operations unless the brakes on such operations are designed to be operated by a single valve.

(c) **Surge brake exception.** This requirement is not applicable to trailers equipped with surge brakes that satisfy the conditions specified in §393.48(d).

§393.50 Reservoirs required.

(a) **Reservoir capacity for air-braked power units manufactured on or after March 1, 1975, and air-braked trailers manufactured on or after January 1, 1975.** Buses, trucks, and truck-tractors manufactured on or after March 1, 1975, and air-braked trailers manufactured on or after January 1, 1975, must meet the reservoir requirements of FMVSS No. 121, S5.1.2, in effect on the date of manufacture.

(b) **Reservoir capacity for air-braked vehicles not subject to FMVSS No. 121 on the date of manufacture and all vacuum braked vehicles.** Each motor vehicle using air or vacuum braking must have either reserve capacity, or a reservoir, that would enable the driver to make a full service brake application with the engine stopped without depleting the air pressure or vacuum below 70 percent of that indicated by the air or vacuum gauge immediately before the brake application is made. For the purposes of this paragraph, a full service brake application means depressing the brake pedal or treadle valve to the limit of its travel.

(c) **Safeguarding of air and vacuum.** Each service reservoir system on a motor vehicle shall be protected against a loss of air pressure or vacuum due to a failure or leakage in the system between the service reservoir and the source of air pressure or vacuum, by check valves or equivalent devices whose proper functioning can be checked without disconnecting any air or vacuum line, or fitting.

(d) **Drain valves for air braked vehicles.** Each reservoir must have a condensate drain valve that can be manually operated. Automatic condensate drain valves may be used provided (1) they may be operated manually, or (2) a manual means of draining the reservoirs is retained.

§393.51 Warning signals, air pressure and vacuum gauges.

(a) **General rule.** Every bus, truck and truck tractor, except as provided in paragraph (f), must be equipped with a signal that provides a warning to the driver when a failure occurs in the vehicle's service brake system. The warning signal must meet the applicable requirements of paragraphs (b), (c), (d) or (e) of this section.

(b) **Hydraulic brakes.** Vehicles manufactured on or after September 1, 1975, must meet the brake system indicator lamp requirements of FMVSS No. 571.105 (S5.3) applicable to the vehicle on the date of manufacture. Vehicles manufactured on or after July 1, 1973 but before September 1, 1975, or to which FMVSS No. 571.105 was not applicable on the date of manufacture, must have a warning signal which operates before or upon application of the brakes in the event of a hydraulic-type complete failure of a partial system. The signal must be either visible within the driver's forward field of view or audible. The signal must be continuous. (Note: FMVSS No. 105 was applicable to trucks and buses from September 1, 1975 to October 12, 1976, and from September 1, 1983, to the present. FMVSS No. 105 was not applicable to trucks and buses manufactured between October 12, 1976, and September 1, 1983. Motor carriers have the

Regulations

option of equipping those vehicles to meet either the indicator lamp requirements of FMVSS No. 105, or the indicator lamp requirements specified in this paragraph for vehicles which were not subject to FMVSS No. 105 on the date of manufacture.)

(c) **Air brakes.** A commercial motor vehicle (regardless of the date of manufacture) equipped with service brakes activated by compressed air (air brakes) or a commercial motor vehicle towing a vehicle with service brakes activated by compressed air (air brakes) must be equipped with a pressure gauge and a warning signal. Trucks, truck tractors, and buses manufactured on or after March 1, 1975, must, at a minimum, have a pressure gauge and a warning signal which meets the requirements of FMVSS No. 121 (S5.1.4 for the pressure gauge and S5.1.5 for the warning signal) applicable to the vehicle on the date of manufacture of the vehicle. Power units to which FMVSS No. 571.121 was not applicable on the date of manufacture of the vehicle must be equipped with—

(1) A pressure gauge, visible to a person seated in the normal driving position, which indicates the air pressure (in kilopascals (kPa) or pounds per square inch (psi)) available for braking; and

(2) A warning signal that is audible or visible to a person in the normal driving position and provides a continuous warning to the driver whenever the air pressure in the service reservoir system is at 379 kPa (55 psi) and below, or one-half of the compressor governor cutout pressure, whichever is less.

(d) **Vacuum brakes.** A commercial motor vehicle (regardless of the date it was manufactured) having service brakes activated by vacuum or a vehicle towing a vehicle having service brakes activated by vacuum must be equipped with—

(1) A vacuum gauge, visible to a person seated in the normal driving position, which indicates the vacuum (in millimeters or inches of mercury) available for braking; and

(2) A warning signal that is audible or visible to a person in the normal driving position and provides a continuous warning to the driver whenever the vacuum in the vehicle's supply reservoir is less than 203 mm (8 inches) of mercury.

(e) **Hydraulic brakes applied or assisted by air or vacuum.** Each vehicle equipped with hydraulically activated service brakes which are applied or assisted by compressed air or vacuum, and to which FMVSS No. 105 was not applicable on the date of manufacture, must be equipped with a warning signal that conforms to paragraph (b) of this section for the hydraulic portion of the system; paragraph (c) of this section for the air assist/air applied portion; or paragraph (d) of this section for the vacuum assist/vacuum applied portion. This paragraph shall not be construed as requiring air pressure gauges or vacuum gauges, only warning signals.

(f) **Exceptions.** The rules in paragraphs (c), (d) and (e) of this section do not apply to property carrying commercial motor vehicles which have less than three axles and (1) were manufactured before July 1, 1973, and (2) have a manufacturer's gross vehicle weight rating less than 4,536 kg (10,001 pounds).

§393.52 Brake performance.

(a) Upon application of its service brakes, a motor vehicle or combination of motor vehicles must under any condition of loading in which it is found on a public highway, be capable of—

(1) Developing a braking force at least equal to the percentage of its gross weight specified in the table in paragraph (d) of this section;

(2) Decelerating to a stop from 20 miles per hour at not less than the rate specified in the table in paragraph (d) of this section; and

(3) Stopping from 20 miles per hour in a distance, measured from the point at which movement of the service brake pedal or control begins, that is not greater than the distance specified in the table in paragraph (d) of this section; or, for motor vehicles or motor vehicle combinations that have a GVWR or GVW greater than 4,536 kg (10,000 pounds),

(4) Developing only the braking force specified in paragraph (a)(1) of this section and the stopping distance specified in paragraph (a)(3) of this section, if braking force is measured by a performance-based brake tester which meets the requirements of functional specifications for performance-based brake testers for commercial motor vehicles, where braking force is the sum of the braking force at each wheel of the vehicle or vehicle combination as a percentage of gross vehicle or combination weight.

(b) Upon application of its emergency brake system and with no other brake system applied, a motor vehicle or combination of motor vehicles must, under any condition of loading in which it is found on a public highway, be capable of stopping from 20 miles per hour in a distance, measured from the point at which movement of the emergency brake control begins, that is not greater than the distance specified in the table in paragraph (d) of this section.

(c) Conformity to the stopping-distance requirements of paragraphs (a) and (b) of this section shall be determined under the following conditions:

(1) Any test must be made with the vehicle on a hard surface that is substantially level, dry, smooth, and free of loose material.

(2) The vehicle must be in the center of a 12-foot-wide lane when the test begins and must not deviate from that lane during the test.

(d) Vehicle brake performance table:

Vehicle Maintenance Pro

Type of motor vehicle	Service brake systems			Emergency brake systems
	Braking force as a percentage of gross vehicle or combination weight	Deceleration in feet per second per second	Application and braking distance in feet from initial speed of 20 m.p.h.	Application and braking distance in feet from initial speed of 20 m.p.h.
A. Passenger-carrying vehicles.				
(1) Vehicles with a seating capacity of 10 persons or less, including driver, and built on a passenger car chassis	65.2	21	20	54
(2) Vehicles with a seating capacity of more than 10 persons, including driver, and built on a passenger car chassis; vehicles built on a truck or bus chassis and having a manufacturer's GVWR of 10,000 pounds or less	52.8	17	25	66
(3) All other passenger-carrying vehicles	43.5	14	35	85
B. Property-carrying vehicles.				
(1) Single unit vehicles having a manufacturer's GVWR of 10,000 pounds or less	52.8	17	25	66
(2) Single unit vehicles having a manufacturer's GVWR of more than 10,000 pounds, except truck tractors. Combinations of a 2-axle towing vehicle and trailer having a GVWR of 3,000 pounds or less. All combinations of 2 or less vehicles in drive-away or tow-away operation	43.5	14	35	85
(3) All other property-carrying vehicles and combinations of property-carrying vehicles	43.5	14	40	90

Notes: (a) There is a definite mathematical relationship between the figures in columns 2 and 3. If the decelerations set forth in column 3 are divided by 32.2 feet per-second per-second, the figures in column 2 will be obtained. (For example, 21 divided by 32.2 equals 65.2 percent.) Column 2 is included in the tabulation because certain brake testing devices utilize this factor.

(b) The decelerations specified in column 3 are an indication of the effectiveness of the basic brakes, and as measured in practical brake testing are the maximum decelerations attained at some time during the stop. These decelerations as measured in brake tests cannot be used to compute the values in column 4 because the deceleration is not sustained at the same rate over the entire period of the stop. The deceleration increases from zero to a maximum during a period of brake system application and brake-force buildup. Also, other factors may cause the deceleration to decrease after reaching a maximum. The added distance that results because maximum deceleration is not sustained is included in the figures in column 4 but is not indicated by the usual brake-testing devices for checking deceleration.

(c) The distances in column 4 and the decelerations in column 3 are not directly related. "Brake-system application and braking distance in feet" (column 4) is a definite measure of the overall effectiveness of the braking system, being the distance traveled between the point at which the driver starts to move the braking controls and the point at which the vehicle comes to rest. It includes distance traveled while the brakes are being applied and distance traveled while the brakes are retarding the vehicle.

(d) The distance traveled during the period of brake-system application and brake-force buildup varies with vehicle type, being negligible for many passenger cars and greatest for combinations of commercial vehicles. This fact accounts for the variation from 20 to 40 feet in the values in column 4 for the various classes of vehicles.

(e) The terms "GVWR" and "GVW" refer to the manufacturer's gross vehicle rating and the actual gross vehicle weight, respectively.

§393.53 Automatic brake adjusters and brake adjustment indicators.

(a) **Automatic brake adjusters (hydraulic brake systems).** Each commercial motor vehicle manufactured on or after October 20, 1993, and equipped with a hydraulic brake system, shall meet the automatic brake adjustment system requirements of Federal Motor Vehicle Safety Standard No. 105 (49 CFR 571.105, S5.1) applicable to the vehicle at the time it was manufactured.

(b) **Automatic brake adjusters (air brake systems).** Each commercial motor vehicle manufactured on or after October 20, 1994, and equipped with an air brake system must meet the automatic brake adjustment system requirements of Federal Motor Vehicle Safety Standard No. 121 (49 CFR 571.121, S5.1.8 or S5.2.2) applicable to the vehicle at the time it was manufactured.

(c) **Brake adjustment indicator (air brake systems).** On each commercial motor vehicle manufactured on or after October 20, 1994, and equipped with an air brake system which contains an external automatic adjustment mechanism and an exposed pushrod, the condition of service brake under-adjustment must be

displayed by a brake adjustment indicator conforming to the requirements of Federal Motor Vehicle Safety Standard No. 121 (49 CFR 571.121, S5.1.8 or S5.2.2) applicable to the vehicle at the time it was manufactured.

§393.55 Antilock brake systems.

(a) **Hydraulic brake systems.** Each truck and bus manufactured on or after March 1, 1999 (except trucks and buses engaged in driveaway-towaway operations), and equipped with a hydraulic brake system, shall be equipped with an antilock brake system that meets the requirements of Federal Motor Vehicle Safety Standard (FMVSS) No. 105 (49 CFR 571.105, S5.5).

(b) **ABS malfunction indicators for hydraulic braked vehicles.** Each hydraulic braked vehicle subject to the requirements of paragraph (a) of this section shall be equipped with an ABS malfunction indicator system that meets the requirements of FMVSS No. 105 (49 CFR 571.105, S5.3).

(c) **Air brake systems.** (1) Each truck tractor manufactured on or after March 1, 1997 (except truck tractors engaged in drive-away-towaway operations), shall be

Regulations

equipped with an antilock brake system that meets the requirements of FMVSS No. 121 (49 CFR 571.121, S5.1.6.1(b)).

(2) Each air braked commercial motor vehicle other than a truck tractor, manufactured on or after March 1, 1998 (except commercial motor vehicles engaged in driveaway-towaway operations), shall be equipped with an antilock brake system that meets the requirements of FMVSS No. 121 (49 CFR 571.121, S5.1.6.1(a) for trucks and buses, S5.2.3 for semitrailers, converter dollies and full trailers).

(d) ABS malfunction circuits and signals for air braked vehicles.

(1) Each truck tractor manufactured on or after March 1, 1997, and each single-unit air braked vehicle manufactured on or after March 1, 1998, subject to the requirements of paragraph (c) of this section, shall be

Vehicle Maintenance Pro

Reserved

Regulations

equipped with an electrical circuit that is capable of signaling a malfunction that affects the generation or transmission of response or control signals to the vehicle's antilock brake system (49 CFR 571.121, S5.1.6.2(a)).

(2) Each truck tractor manufactured on or after March 1, 2001, and each single-unit vehicle that is equipped to tow another air-braked vehicle, subject to the requirements of paragraph (c) of this section, shall be equipped with an electrical circuit that is capable of transmitting a malfunction signal from the antilock brake system(s) on the towed vehicle(s) to the trailer ABS malfunction lamp in the cab of the towing vehicle, and shall have the means for connection of the electrical circuit to the towed vehicle. The ABS malfunction circuit and signal shall meet the requirements of FMVSS No. 121 (49 CFR 571.121, S5.1.6.2(b)).

(3) Each semitrailer, trailer converter dolly, and full trailer manufactured on or after March 1, 2001, and subject to the requirements of paragraph (c)(2) of this section, shall be equipped with an electrical circuit that is capable of signaling a malfunction in the trailer's antilock brake system, and shall have the means for connection of this ABS malfunction circuit to the towing vehicle. In addition, each trailer manufactured on or after March 1, 2001, subject to the requirements of paragraph (c)(2) of this section, that is designed to tow another air-brake equipped trailer shall be capable of transmitting a malfunction signal from the antilock brake system(s) of the trailer(s) it tows to the vehicle in front of the trailer. The ABS malfunction circuit and signal shall meet the requirements of FMVSS No. 121 (49 CFR 571.121, S5.2.3.2).

(e) **Exterior ABS malfunction indicator lamps for trailers.** Each trailer (including a trailer converter dolly) manufactured on or after March 1, 1998, and subject to the requirements of paragraph (c)(2) of this section, shall be equipped with an ABS malfunction indicator lamp which meets the requirements of FMVSS No. 121 (49 CFR 571.121, S5.2.3.3).

Subpart D—Glazing and window construction

§393.60 Glazing in specified openings.

(a) **Glazing material.** Glazing material used in windshields, windows, and doors on a motor vehicle manufactured on or after December 25, 1968, shall at a minimum meet the requirements of Federal Motor Vehicle Safety Standard (FMVSS) No. 205 in effect on the date of manufacture of the motor vehicle. The glazing material shall be marked in accordance with FMVSS No. 205 (49 CFR 571.205, S6).

(b) **Windshields required.** Each bus, truck and truck-tractor shall be equipped with a windshield. Each windshield or portion of a multi-piece windshield shall be mounted using the full periphery of the glazing material.

(c) **Windshield condition.** With the exception of the conditions listed in paragraphs (c)(1), (c)(2), and (c)(3) of this section, each windshield shall be free of discoloration or damage in the area extending upward from the height of the top of the steering wheel (excluding a 51

mm (2 inch) border at the top of the windshield) and extending from a 25 mm (1 inch) border at each side of the windshield or windshield panel.

Exceptions:

(1) Coloring or tinting which meets the requirements of paragraph (d) of this section;

(2) Any crack that is not intersected by any other cracks;

(3) Any damaged area which can be covered by a disc 19 mm ($\frac{3}{4}$ inch) in diameter if not closer than 76 mm (3 inches) to any other similarly damaged area.

(d) **Coloring or tinting of windshields and windows.** Coloring or tinting of windshields and the windows to the immediate right and left of the driver is allowed, provided the parallel luminous transmittance through the colored or tinted glazing is not less than 70 percent of the light at normal incidence in those portions of the windshield or windows which are marked as having a parallel luminous transmittance of not less than 70 percent. The transmittance restriction does not apply to other windows on the commercial motor vehicle.

(e) **Prohibition on obstructions to the driver's field of view—(1) Devices mounted at the top of the windshield.** Antennas, transponders, and similar devices must not be mounted more than 152 mm (6 inches) below the upper edge of the windshield. These devices must be located outside the area swept by the windshield wipers, and outside the driver's sight lines to the road and highway signs and signals.

(2) **Decals and stickers mounted on the windshield.** Commercial Vehicle Safety Alliance (CVSA) inspection decals, and stickers and/or decals required under Federal or State laws may be placed at the bottom or sides of the windshield provided such decals or stickers do not extend more than 115 mm ($4\frac{1}{2}$ inches) from the bottom of the windshield and are located outside the area swept by the windshield wipers, and outside the driver's sight lines to the road and highway signs or signals.

§393.61 Truck and truck tractor window construction.

Each truck and truck tractor (except trucks engaged in armored car service) shall have at least one window on each side of the driver's compartment. Each window must have a minimum area of 1,290 cm² (200 in²) formed by a rectangle 33 cm by 45 cm (13 inches by 17 $\frac{3}{4}$ inches). The maximum radius of the corner arcs shall not exceed 152 mm (6 inches). The long axis of the rectangle shall not make an angle of more than 45 degrees with the surface on which the unladen vehicle stands. If the cab is designed with a folding door or doors or with clear openings where doors or windows are customarily located, no windows shall be required in those locations.

§393.62 Emergency exits for buses.

(a) **Buses manufactured on or after September 1, 1994.** Each bus with a GVWR of 4,536 kg (10,000 pounds) or less must meet the emergency exit requirements of FMVSS No. 217 (S5.2.2.3) in effect on the date of manufacture. Each bus with a GVWR of more than 4,536 kg (10,000 pounds) must have emergency exits which meet the applicable emergency exit requirements of FMVSS

Vehicle Maintenance Pro

No. 217 (S5.2.2 or S5.2.3) in effect on the date of manufacture.

(b) **Buses manufactured on or after September 1, 1973, but before September 1, 1994.** (1) Each bus (including a school bus used in interstate commerce for non-school bus operations) with a GVWR of more than 4,536 kg (10,000 lbs) must meet the requirements of FMVSS No. 217, S5.2.2 in effect on the date of manufacture.

(2) Each bus (including a school bus used in interstate commerce for non-school bus operations) with a GVWR of 4,536 kg (10,000 lbs) or less must meet the requirements of FMVSS No. 217, S5.2.2.3 in effect on the date of manufacture.

(c) **Buses manufactured before September 1, 1973.** For each seated passenger space provided, inclusive of the driver there shall be at least 432 cm² (67 square inches) of glazing if such glazing is not contained in a push-out window; or, at least 432 cm² (67 square inches) of free opening resulting from opening of a push-out type window. No area shall be included in this minimum prescribed area unless it will provide an unobstructed opening of at least 1,290 cm² (200 in²) formed by a rectangle 33 cm by 45 cm (13 inches by 17¾ inches). The maximum radius of the corner arcs shall not exceed 152 mm (6 inches). The long axis of the rectangle shall not make an angle of more than 45 degrees with the surface on which the unladen vehicle stands. The area shall be measured either by removal of the glazing if not of the push-out type, or of the movable sash if of the push-out type. The exit must comply with paragraph (d) of this section. Each side of the bus must have at least 40 percent of emergency exit space required by this paragraph.

(d) **Laminated safety glass/push-out window requirements for buses manufactured before September 1, 1973.** Emergency exit space used to satisfy the requirements of paragraph (c) of this section must have laminated safety glass or push-out windows designed and maintained to yield outward to provide a free opening.

(1) **Safety glass.** Laminated safety glass must meet Test No. 25, Egress, of American National Standard for Safety Glazing Materials for Glazing Motor Vehicles and Motor Vehicle Equipment Operating on Land Highways-Safety Standards ANSI/SAE Z26. 1/96, August 1997. (See §393.7(b) for information on incorporation by reference and availability of this document.)

(2) **Push-out windows.** Each push-out window shall be releasable by operating no more than two mechanisms and allow manual release of the exit by a single occupant. For mechanisms which require rotary or straight (parallel to the undisturbed exit surface) motions to operate the exit, no more than 89 Newtons (20 pounds) of force shall be required to release the exit. For exits which require a straight motion perpendicular to the undisturbed exit surface, no more than 267 Newtons (60 pounds) shall be required to release the exit.

(e) **Emergency exit identification.** Each bus and each school bus used in interstate commerce for non-school bus operations, manufactured on or after September 1, 1973, shall meet the applicable emergency exit identification or marking requirements of FMVSS

No. 217, S5.5, in effect on the date of manufacture. The emergency exits and doors on all buses (including school buses used in interstate commerce for non-school bus operations) must be marked "Emergency Exit" or "Emergency Door" followed by concise operating instructions describing each motion necessary to unlatch or open the exit located within 152 mm (6 inches) of the release mechanism.

(f) **Exception for the transportation of prisoners.** The requirements of this section do not apply to buses used exclusively for the transportation of prisoners.

§393.63 [Reserved]

Subpart E—Fuel systems

§393.65 All fuel systems.

(a) **Application of the rules in this section.** The rules in this section apply to systems for containing and supplying fuel for the operation of motor vehicles or for the operation of auxiliary equipment installed on, or used in connection with, motor vehicles.

(b) **Location.** Each fuel system must be located on the motor vehicle so that—

(1) No part of the system extends beyond the widest part of the vehicle;

(2) No part of a fuel tank is forward of the front axle of a power unit;

(3) Fuel spilled vertically from a fuel tank while it is being filled will not contact any part of the exhaust or electrical systems of the vehicle, except the fuel level indicator assembly;

(4) Fill pipe openings are located outside the vehicle's passenger compartment and its cargo compartment;

(5) A fuel line does not extend between a towed vehicle and the vehicle that is towing it while the combination of vehicles is in motion; and

(6) No part of the fuel system of a bus manufactured on or after January 1, 1973, is located within or above the passenger compartment.

(c) **Fuel tank installation.** Each fuel tank must be securely attached to the motor vehicle in a workmanlike manner.

(d) **Gravity or syphon feed prohibited.** A fuel system must not supply fuel by gravity or syphon feed directly to the carburetor or injector.

(e) **Selection control valve location.** If a fuel system includes a selection control valve which is operable by the driver to regulate the flow of fuel from two or more fuel tanks, the valve must be installed so that either—

(1) The driver may operate it while watching the roadway and without leaving his driving position; or

(2) The driver must stop the vehicle and leave his seat in order to operate the valve.

(f) **Fuel lines.** A fuel line which is not completely enclosed in a protective housing must not extend more

Regulations

than 2 inches below the fuel tank or its sump. Diesel fuel crossover, return, and withdrawal lines which extend below the bottom of the tank or sump must be protected against damage from impact. Every fuel line must be—

(1) Long enough and flexible enough to accommodate normal movements of the parts to which it is attached without incurring damage; and

(2) Secured against chafing, kinking, or other causes of mechanical damage.

(g) **Excess flow valve.** When pressure devices are used to force fuel from a fuel tank, a device which prevents the flow of fuel from the fuel tank if the fuel feed line is broken must be installed in the fuel system.

§393.67 Liquid fuel tanks.

(a) **Application of the rules in this section.** The rules in this section apply to tanks containing or supplying fuel for the operation of commercial motor vehicles or for the operation of auxiliary equipment installed on, or used in connection with commercial motor vehicles.

(1) A liquid fuel tank manufactured on or after January 1, 1973, and a side-mounted gasoline tank must conform to all the rules in this section.

(2) A diesel fuel tank manufactured before January 1, 1973, and mounted on a bus must conform to the rules in paragraphs (c)(7)(ii) and (d)(2) of this section.

(3) A diesel fuel tank manufactured before January 1, 1973, and mounted on a vehicle other than bus must conform to the rules in paragraph (c)(7)(ii) of this section.

(4) A gasoline tank, other than a side-mounted gasoline tank, manufactured before January 1, 1973, and mounted on a bus must conform to the rules in paragraphs (c)(1) through (10) and (d)(2) of this section.

(5) A gasoline tank, other than a side-mounted gasoline tank, manufactured before January 1, 1973, and mounted on a vehicle other than a bus must conform to the rules in paragraphs (c)(1) through (10), inclusive, of this section.

(6) **Private motor carrier of passengers.** Motor carriers engaged in the private transportation of passengers may continue to operate a commercial motor vehicle which was not subject to this section or 49 CFR 571.301 at the time of its manufacture, provided the fuel tank of such vehicle is maintained to the original manufacturer's standards.

(7) Motor vehicles that meet the fuel system integrity requirements of 49 CFR 571.301 are exempt from the requirements of this subpart, as they apply to the vehicle's fueling system.

(b) **Definitions.** As used in this section—

(1) The term "liquid fuel tank" means a fuel tank designed to contain a fuel that is liquid at normal atmospheric pressures and temperatures.

(2) A "side-mounted" fuel tank is a liquid fuel tank which—

(i) If mounted on a truck tractor, extends outboard of the vehicle frame and outside of the plan view outline of the cab; or

(ii) If mounted on a truck, extends outboard of a line parallel to the longitudinal centerline of the truck and tangent to the outboard side of a front tire in a straight ahead position. In determining whether a fuel tank on a truck or truck tractor is side-mounted, the fill pipe is not considered a part of the tank.

(c) **Construction of liquid fuel tanks—**

(1) **Joints.** Joints of a fuel tank body must be closed by arc-, gas-, seam-, or spot-welding, by brazing, by silver soldering, or by techniques which provide heat resistance and mechanical securement at least equal to those specifically named. Joints must not be closed solely by crimping or by soldering with a lead-based or other soft solder.

(2) **Fittings.** The fuel tank body must have flanges or spuds suitable for the installation of all fittings.

(3) **Threads.** The threads of all fittings must be Dryseal American Standard Taper Pipe Thread or Dryseal SAE Short Taper Pipe Thread, specified in Society of Automotive Engineers Standard J476, as contained in the 1971 edition of the "SAE Handbook", except that straight (non-tapered) threads may be used on fittings having integral flanges and using gaskets for sealing. At least four full threads must be in engagement in each fitting.

(4) **Drains and bottom fittings.**

(i) Drains or other bottom fittings must not extend more than $\frac{3}{4}$ of an inch below the lowest part of the fuel tank or sump.

(ii) Drains or other bottom fittings must be protected against damage from impact.

(iii) If a fuel tank has drains the drain fittings must permit substantially complete drainage of the tank.

(iv) Drains or other bottom fittings must be installed in a flange or spud designed to accommodate it.

(5) **Fuel withdrawal fittings.** Except for diesel fuel tanks, the fittings through which fuel is withdrawn from a fuel tank must be located above the normal level of fuel in the tank when the tank is full.

(6) [Reserved]

(7) **Fill pipe.** (i) Each fill pipe must be designed and constructed to minimize the risk of fuel spillage during fueling operations and when the vehicle is involved in a crash.

(ii) For diesel-fueled vehicles, the fill pipe and vents of a fuel tank having a capacity of more than 94.75 L (25 gallons) of fuel must permit filling the tank with fuel at a rate of at least 75.8 L/m (20 gallons per minute) without fuel spillage.

(iii) For gasoline- and methanol-fueled vehicles with a GVWR of 3,744 kg (8,500 pounds) or less, the vehicle must permit filling the tank with fuel dispensed at the applicable fill rate required by the regulations of the Environmental Protection Agency under 40 CFR 80.22.

(iv) For gasoline- and methanol-fueled vehicles with a GVWR of 14,000 pounds (6,400 kg) or less, the vehicle must comply with the applicable fuel-spitback prevention and onboard refueling vapor recovery regulations of the Environmental Protection Agency under 40 CFR part 86.

Vehicle Maintenance Pro

(v) Each fill pipe must be fitted with a cap that can be fastened securely over the opening in the fill pipe. Screw threads or a bayonet-type point are methods of conforming to the requirements of paragraph (c) of this section.

(8) **Safety venting system.** A liquid fuel tank with a capacity of more than 25 gallons of fuel must have a venting system which, in the event the tank is subjected to fire, will prevent internal tank pressure from rupturing the tank's body, seams, or bottom opening (if any).

(9) **Pressure resistance.** The body and fittings of a liquid fuel tank with a capacity of more than 25 gallons of fuel must be capable of withstanding an internal hydrostatic pressure equal to 150 percent of the maximum internal pressure reached in the tank during the safety venting system test specified in paragraph (d)(1) of this section.

(10) **Air vent.** Each fuel tank must be equipped with a non-spill air vent (such as a ball check). The air vent may be combined with the fill-pipe cap or safety vent, or it may be a separate unit installed on the fuel tank.

(11) **Markings.** If the body of the fuel tank is readily visible when the tank is installed on the vehicle, the tank must be plainly marked with its liquid capacity. The tank must also be plainly marked with a warning against filling it to more than 95 percent of its liquid capacity.

(12) **Overfill restriction.** A liquid fuel tank manufactured on or after January 1, 1973, must be designed and constructed so that—

(i) The tank cannot be filled, in a normal filling operation, with a quantity of fuel that exceeds 95 percent of the tank's liquid capacity; and

(ii) When the tank is filled, normal expansion of the fuel will not cause fuel spillage.

(d) **Liquid fuel tank tests.** Each liquid fuel tank must be capable of passing the tests specified in paragraphs (d)(1) and (2) of this section. The specified tests are a measure of performance only. Alternative procedures which assure that equipment meets the required performance standards may be used.

(1) **Safety venting system test—**

(i) **Procedure.** Fill the tank three-fourths full with fuel, seal the fuel feed outlet, and invert the tank. When the fuel temperature is between 50°F. and 80°F., apply an enveloping flame to the tank so that the temperature of the fuel rises at a rate of not less than 6°F. and not more than 8°F. per minute.

(ii) **Required performance.** The safety venting system required by paragraph (c)(8) of this section must activate before the internal pressure in the tank exceeds 50 pounds per square inch, gauge, and the internal pressure must not thereafter exceed the pressure at which the system activated by more than five pounds per square inch despite any further increase in the temperature of the fuel.

(2) **Leakage test—**

(i) **Procedure.** Fill the tank to capacity with fuel having a temperature between 50 °F. and 80 °F. With the fill-pipe cap installed, turn the tank through an angle of

150° in any direction about any axis from its normal position.

(ii) **Required performance.** Neither the tank nor any fitting may leak more than a total of one ounce by weight of fuel per minute in any position the tank assumes during the test.

(e) **Side-mounted liquid fuel tank tests.** Each side-mounted liquid fuel tank must be capable of passing the tests specified in paragraphs (e)(1) and (2) of this section and the test specified in paragraphs (d)(1) and (2) of this section. The specified tests are a measure of performance only. Alternative procedures which assure that equipment meets the required performance criteria may be used.

(1) **Drop test—**

(i) **Procedure.** Fill the tank with a quantity of water having a weight equal to the weight of the maximum fuel load of the tank and drop the tank 30 feet onto an unyielding surface so that it lands squarely on one corner.

(ii) **Required performance.** Neither the tank nor any fitting may leak more than a total of 1 ounce by weight of water per minute.

(2) **Fill-pipe test—**

(i) **Procedure.** Fill the tank with a quantity of water having a weight equal to the weight of the maximum fuel load of the tank and drop the tank 10 feet onto an unyielding surface so that it lands squarely on its fill-pipe.

(ii) **Required performance.** Neither the tank nor any fitting may leak more than a total of 1 ounce by weight of water per minute.

(f) **Certification and markings.** Each liquid fuel tank shall be legibly and permanently marked by the manufacturer with the following minimum information:

(1) The month and year of manufacture.

(2) The manufacturer's name on tanks manufactured on and after July 1, 1989, and means of identifying the facility at which the tank was manufactured, and

(3) A certificate that it conforms to the rules in this section applicable to the tank. The certificate must be in the form set forth in either of the following:

(i) If a tank conforms to all rules in this section pertaining to side-mounted fuel tanks: "Meets all FMCSA sidemounted tank requirements."

(ii) If a tank conforms to all rules in this section pertaining to tanks which are not side-mounted fuel tanks: "Meets all FMCSA requirements for non-side-mounted fuel tanks."

(iii) The form of certificate specified in paragraph (f)(3) (i) or (ii) of this section may be used on a liquid fuel tank manufactured before July 11, 1973, but it is not mandatory for liquid fuel tanks manufactured before March 7, 1989. The form of certification manufactured on or before March 7, 1989, must meet the requirements in effect at the time of manufacture.

(4) **Exception.** The following previously exempted vehicles are not required to carry the certification and marking specified in paragraphs (f)(1) through (3) of this section:

Regulations

(i) Ford vehicles with GVWR over 10,000 pounds identified as follows: The vehicle identification numbers (VINs) contain A, K, L, M, N, W, or X in the fourth position.

(ii) GM G-Vans (Chevrolet Express and GMC Savanna) and full-sized C/K trucks (Chevrolet Silverado and GMC Sierra) with GVWR over 10,000 pounds identified as follows: The VINs contain either a “J” or a “K” in the fourth position. In addition, the seventh position of the VINs on the G-Van will contain a “1.”

§393.68 Compressed natural gas fuel containers.

(a) **Applicability.** The rules in this section apply to compressed natural gas (CNG) fuel containers used for supplying fuel for the operation of commercial motor vehicles or for the operation of auxiliary equipment installed on, or used in connection with commercial motor vehicles.

(b) **CNG containers manufactured on or after March 26, 1995.** Any motor vehicle manufactured on or after March 26, 1995, and equipped with a CNG fuel tank must meet the CNG container requirements of FMVSS No. 304 (49 CFR 571.304) in effect at the time of manufacture of the vehicle.

(c) **Labeling.** Each CNG fuel container shall be permanently labeled in accordance with the requirements of FMVSS No. 304, S7.4.

§393.69 Liquefied petroleum gas systems.

(a) A fuel system that uses liquefied petroleum gas as a fuel for the operation of a motor vehicle or for the operation of auxiliary equipment installed on, or used in connection with, a motor vehicle must conform to the “Standards for the Storage and Handling of Liquefied Petroleum Gases” of the National Fire Protection Association, Battery March Park, Quincy, MA 02269, as follows:

(1) A fuel system installed before December 31, 1962, must conform to the 1951 edition of the Standards.

(2) A fuel system installed on or after December 31, 1962, and before January 1, 1973, must conform to Division IV of the June 1959 edition of the Standards.

(3) A fuel system installed on or after January 1, 1973, and providing fuel for propulsion of the motor vehicle must conform to Division IV of the 1969 edition of the Standards.

(4) A fuel system installed on or after January 1, 1973, and providing fuel for the operation of auxiliary equipment must conform to Division VII of the 1969 edition of the Standards.

(b) When the rules in this section require a fuel system to conform to a specific edition of the Standards, the fuel system may conform to the applicable provisions in a later edition of the Standards specified in this section.

(c) The tank of a fuel system must be marked to indicate that the system conforms to the Standards.

Subpart F—Coupling devices and towing methods

§393.70 Coupling devices and towing methods, except for driveaway-towaway operations.

(a) **Tracking.** When two or more vehicles are operated in combination, the coupling devices connecting the vehicles shall be designed, constructed, and installed, and the vehicles shall be designed and constructed, so that when the combination is operated in a straight line on a level, smooth, paved surface, the path of the towed vehicle will not deviate more than 3 inches to either side of the path of the vehicle that tows it.

(b) **Fifth wheel assemblies—(1) Mounting—(i) Lower half.** The lower half of a fifth wheel mounted on a truck tractor or converter dolly must be secured to the frame of that vehicle with properly designed brackets, mounting plates or angles and properly tightened bolts of adequate size and grade, or devices that provide equivalent security. The installation shall not cause cracking, warping, or deformation of the frame. The installation must include a device for positively preventing the lower half of the fifth wheel from shifting on the frame to which it is attached.

(ii) **Upper half.** The upper half of a fifth wheel must be fastened to the motor vehicle with at least the same security required for the installation of the lower half on a truck tractor or converter dolly.

(2) **Locking.** Every fifth wheel assembly must have a locking mechanism. The locking mechanism, and any adapter used in conjunction with it, must prevent separation of the upper and lower halves of the fifth wheel assembly unless a positive manual release is activated. The release may be located so that the driver can operate it from the cab. If a motor vehicle has a fifth wheel designed and constructed to be readily separable, the fifth wheel locking devices shall apply automatically on coupling.

(3) **Location.** The lower half of a fifth wheel shall be located so that, regardless of the condition of loading, the relationship between the kingpin and the rear axle or axles of the towing motor vehicle will properly distribute the gross weight of both the towed and towing vehicles on the axles of those vehicles, will not unduly interfere with the steering, braking, and other maneuvering of the towing vehicle, and will not otherwise contribute to unsafe operation of the vehicles comprising the combination. The upper half of a fifth wheel shall be located so that the weight of the vehicles is properly distributed on their axles and the combination of vehicles will operate safely during normal operation.

(c) **Towing of full trailers.** A full trailer must be equipped with a tow-bar and a means of attaching the tow-bar to the towing and towed vehicles. The tow-bar and the means of attaching it must—

(1) Be structurally adequate for the weight being drawn;

(2) Be properly and securely mounted;

(3) Provide for adequate articulation at the connection without excessive slack at that location; and

Vehicle Maintenance Pro

(4) Be provided with a locking device that prevents accidental separation of the towed and towing vehicles. The mounting of the trailer hitch (pintle hook or equivalent mechanism) on the towing vehicle must include reinforcement or bracing of the frame sufficient to produce strength and rigidity of the frame to prevent its undue distortion.

(d) **Safety devices in case of tow-bar failure or disconnection.** Every full trailer and every converter dolly used to convert a semitrailer to a full trailer must be coupled to the frame, or an extension of the frame, of the motor vehicle which tows it with one or more safety devices to prevent the towed vehicle from breaking loose in the event the tow-bar fails or becomes disconnected. The safety device must meet the following requirements:

(1) The safety device must not be attached to the pintle hook or any other device on the towing vehicle to which the tow-bar is attached. However, if the pintle hook or other device was manufactured prior to July 1, 1973, the safety device may be attached to the towing vehicle at a place on a pintle hook forging or casting if that place is independent of the pintle hook.

(2) The safety device must have no more slack than is necessary to permit the vehicles to be turned properly.

(3) The safety device, and the means of attaching it to the vehicles, must have an ultimate strength of not less than the gross weight of the vehicle or vehicles being towed.

(4) The safety device must be connected to the towed and towing vehicles and to the tow-bar in a manner which prevents the tow-bar from dropping to the ground in the event it fails or becomes disconnected.

(5) Except as provided in paragraph (d) (6) of this section, if the safety device consists of safety chains or cables, the towed vehicle must be equipped with either two safety chains or cables or with a bridle arrangement of a single chain or cable attached to its frame or axle at two points as far apart as the configuration of the frame or axle permits. The safety chains or cables shall be either two separate pieces, each equipped with a hook or other means for attachment to the towing vehicle, or a single piece leading along each side of the tow-bar from the two points of attachment on the towed vehicle and arranged into a bridle with a single means of attachment to be connected to the towing vehicle. When a single length of cable is used, a thimble and twin-base cable clamps shall be used to form the forward bridle eye. The hook or other means of attachment to the towing vehicle shall be secured to the chains or cables in a fixed position.

(6) If the towed vehicle is a converter dolly with a solid tongue and without a hinged tow-bar or other swivel between the fifth wheel mounting and the attachment point of the tongue eye or other hitch device—

(i) Safety chains or cables, when used as the safety device for that vehicle, may consist of either two chains or cables or a single chain or cable used alone;

(ii) A single safety device, including a single chain or cable used alone as the safety device, must be in line with the centerline of the trailer tongue; and

(iii) The device may be attached to the converter dolly at any point to the rear of the attachment point of the tongue eye or other hitch device.

(7) Safety devices other than safety chains or cables must provide strength, security of attachment, and directional stability equal to, or greater than, safety chains or cables installed in accordance with paragraphs (d)(5) and (6) of this section.

(8)(i) When two safety devices, including two safety chains or cables, are used and are attached to the towing vehicle at separate points, the points of attachment on the towing vehicle shall be located equally distant from, and on opposite sides of, the longitudinal centerline of the towing vehicle.

(ii) Where two chains or cables are attached to the same point on the towing vehicle, and where a bridle or a single chain or cable is used, the point of attachment must be on the longitudinal centerline or within 152 mm (6 inches) to the right of the longitudinal centerline of the towing vehicle.

(iii) A single safety device, other than a chain or cable, must also be attached to the towing vehicle at a point on the longitudinal centerline or within 152 mm (6 inches) to the right of the longitudinal centerline of the towing vehicle.

§393.71 Coupling devices and towing methods, driveaway-towaway operations.

(a) **Number in combination.** (1) No more than three saddle-mounts may be used in any combination.

(2) No more than one tow-bar or ball-and-socket type coupling device may be used in any combination.

(3) When motor vehicles are towed by means of triple saddle-mounts, all but the final towed vehicle must have brakes acting on all wheels in contact with the roadway.

(b) **Carrying vehicles on towing vehicle.** (1) When adequately and securely attached by means equivalent in security to that provided in paragraph (j)(2) of this section, a motor vehicle or motor vehicles may be full-mounted on the structure of a towing vehicle engaged in any driveaway-towaway operation.

(2) No motor vehicle or motor vehicles may be full-mounted on a towing vehicle unless the relationship of such full-mounted vehicles to the rear axle or axles results in proper distribution of the total gross weight of the vehicles and does not unduly interfere with the steering, braking, or maneuvering of the towing vehicle, or otherwise contribute to the unsafe operation of the vehicles comprising the combination.

(3) Saddle-mounted vehicles must be arranged such that the gross weight of the vehicles is properly distributed to prevent undue interference with the steering, braking, or maneuvering of the combination of vehicles.

(c) **Carrying vehicles on towed vehicles.** (1) When adequately and securely attached by means equivalent in security to that provided in paragraph (j)(2) of this section, a motor vehicle or motor vehicles may be full-mounted on the structure of towed vehicles engaged in any driveaway-towaway operation.

(2) No motor vehicle shall be full-mounted on a motor vehicle towed by means of a tow-bar unless the towed

Regulations

vehicle is equipped with brakes and is provided with means for effective application of brakes acting on all wheels and is towed on its own wheels.

(3) No motor vehicle or motor vehicles shall be full-mounted on a motor vehicle towed by means of a saddle-mount unless the centerline of the kingpin or equivalent means of attachment of such towed vehicle shall be so located on the towing vehicle that the relationship to the rear axle or axles results in proper distribution of the total gross weight of the vehicles and does not unduly interfere with the steering, braking, or maneuvering of the towing vehicle or otherwise contribute to the unsafe operation of vehicles comprising the combination; and unless a perpendicular to the ground from the center of gravity of the full-mounted vehicles lies forward of the centerline of the rear axle of the saddle-mounted vehicle.

(4) If a motor vehicle towed by means of a saddle-mount has any vehicle full-mounted on it, the saddle-mounted vehicle must at all times while so loaded have effective brakes acting on all wheels in contact with the roadway.

(d) **Bumper tow-bars on heavy vehicles prohibited.** Tow-bars of the type which depend upon the bumpers as a means of transmitting forces between the vehicles shall not be used to tow a motor vehicle weighing more than 5,000 pounds.

(e) **Front wheels of saddle-mounted vehicles restrained.** A motor vehicle towed by means of a saddle-mount shall have the motion of the front wheels restrained if under any condition of turning of such wheels they will project beyond the widest part of either the towed or towing vehicle.

(f) **Vehicles to be towed in forward position.** Unless the steering mechanism is adequately locked in a straight forward position, all motor vehicles towed by means of a saddle-mount shall be towed with the front end mounted on the towing vehicle.

(g) **Means required for towing.** Means required for towing. No motor vehicles or combination of motor vehicles shall be towed in driveaway-towaway operations by means other than a tow-bar, ball-and-socket type coupling device, saddle-mount connections which meet the requirements of this section, or in the case of a semi-trailer equipped with an upper coupler assembly, a fifth-wheel meeting the requirements of §393.70.

(h) **Requirements for tow-bars.** Tow-bars shall comply with the following requirements:

(1) **Tow-bars, structural adequacy and mounting.** Every tow-bar shall be structurally adequate and properly installed and maintained. To insure that it is structurally adequate, it must, at least, meet the requirements of the following table:

Gross weight of towed vehicle (pounds) ¹	Longitudinal strength in tension and compression ²		Strength as a beam (in any direction concentrated load at center) ^{2,3}
	All towbars	New towbars acquired and used by a motor carrier after Sept. 30, 1948	
	Pounds	Pounds	Pounds

Gross weight of towed vehicle (pounds) ¹	Longitudinal strength in tension and compression ²		Strength as a beam (in any direction concentrated load at center) ^{2,3}
	All towbars	New towbars acquired and used by a motor carrier after Sept. 30, 1948	
Less than 5,000	3,000	6,500	3,000
5,000 and over			
Less than 10,000	6,000	(¹)	(¹)
10,000 and over			
Less than 15,000	9,000	(¹)	(¹)

¹The required strength of tow-bars for towed vehicles of 15,000 pounds and over gross weight and of new tow-bars acquired and used after Sept. 30, 1948, for towed vehicles of 5,000 pounds and over gross weight shall be computed by means of the following formulae: Longitudinal strength = gross weight of towed vehicle x 1.3. Strength as a beam = gross weight of towed vehicle x 0.6.

²In testing, the whole unit shall be tested with all clamps, joints, and pins so mounted and fastened as to approximate conditions of actual operation.

³This test shall be applicable only to tow-bars which are, in normal operation, subjected to a bending movement such as tow-bars for house trailers.

(2) **Tow-bars, jointed.** The tow-bar shall be so constructed as to freely permit motion in both horizontal and vertical planes between the towed and towing vehicles. The means used to provide the motion shall be such as to prohibit the transmission of stresses under normal operation between the towed and towing vehicles, except along the longitudinal axis of the tongue or tongues.

(3) **Tow-bar fastenings.** The means used to transmit the stresses to the chassis or frames of the towed and towing vehicles may be either temporary structures or bumpers or other integral parts of the vehicles: Provided, however, that the means used shall be so constructed, installed, and maintained that, when tested as an assembly, failure in such members shall not occur when the weakest new tow-bar which is permissible under paragraph (h)(1) of this section is subjected to the tests given therein.

(4) **Means of adjusting length.** On tow-bars, adjustable as to length, the means used to make such adjustment shall fit tightly and not result in any slackness or permit the tow-bar to bend. With the tow-bar supported rigidly at both ends and with a load of 50 pounds at the center, the sag, measured at the center, in any direction shall not exceed 0.25 inch under any condition of adjustment as to length.

(5) **Method of clamping.** Adequate means shall be provided for securely fastening the tow-bar to the towed and towing vehicles.

(6) **Tow-bar connection to steering mechanism.** The tow-bar shall be provided with suitable means of attachment to and actuation of the steering mechanism, if any, of the towed vehicle. The attachment shall provide for sufficient angularity of movement of the front wheels of the towed vehicle so that it may follow substantially in the path of the towing vehicle without cramping the tow-bar. The tow-bar shall be provided with suitable joints to permit such movement.

Vehicle Maintenance Pro

(7) **Tracking.** The tow-bar shall be so designed, constructed, maintained, and mounted as to cause the towed vehicle to follow substantially in the path of the towing vehicle. Tow-bars of such design or in such condition as to permit the towed vehicle to deviate more than 3 inches to either side of the path of a towing vehicle moving in a straight line as measured from the center of the towing vehicle are prohibited.

(8) **Passenger car-trailer type couplings.** Trailer couplings used for driveaway-towaway operations of passenger car trailers shall conform to Society of Automotive Engineers Standard No. J684c, "Trailer Couplings and Hitches—Automotive Type," July 1970.¹

(9) **Marking tow-bars.** Every tow-bar acquired and used in driveaway-towaway operations by a motor carrier shall be plainly marked with the following certification of the manufacturer thereof (or words of equivalent meaning):

This tow-bar complies with the requirements of the Federal Motor Carrier Safety Administration for (maximum gross weight for which tow-bar is manufactured) vehicles.

Allowable Maximum Gross Weight _____
 Manufactured _____
 (Month and year)
 by _____
 (Name of manufacturer)

Tow-bar certification manufactured before March 7, 1989 must meet requirements in effect at the time of manufacture.

(10) **Safety devices in case of tow-bar failure or disconnection.** (i) The towed vehicle shall be connected to the towing vehicle by a safety device to prevent the towed vehicle from breaking loose in the event the tow-bar fails or becomes disconnected. When safety chains or cables are used as the safety device for that vehicle, at least two safety chains or cables meeting the requirements of paragraph (h)(10)(ii) of this section shall be used. The tensile strength of the safety device and the means of attachment to the vehicles shall be at least equivalent to the corresponding longitudinal strength for tow-bars required in the table of paragraph (h)(1) of this section. If safety chains or cables are used as the safety device, the required strength shall be the combined strength of the combination of chains and cables.

(ii) If chains or cables are used as the safety device, they shall be crossed and attached to the vehicles near the points of bumper attachments to the chassis of the vehicles. The length of chain used shall be no more than necessary to permit free turning of the vehicles. The chains shall be attached to the tow-bar at the point of crossing or as close to that point as is practicable.

(iii) A safety device other than safety chains or cables must provide strength, security of attachment, and directional stability equal to, or greater than, that provided by safety chains or cables installed in accordance with paragraph (h)(10)(ii) of this section. A safety device other than safety chains or cables must be designed, constructed, and installed so that, if the tow-bar fails or

becomes disconnected, the tow-bar will not drop to the ground.

(i) [Reserved]

(j) **Requirements for upper-half of saddle-mounts.** The upper-half of any saddle-mount shall comply with the following requirements:

(1) **Upper-half connection to towed vehicle.** The upper-half shall be securely attached to the frame or axle of the towed vehicle by means of U-bolts or other means providing at least equivalent security.

(2) **U-bolts or other attachments.** U-bolts used to attach the upper-half to the towed vehicles shall be made of steel rod, free of defects, so shaped as to avoid at any point a radius of less than 1 inch; Provided, however, that a lesser radius may be utilized if the U-bolt is so fabricated as not to cause more than 5 percent reduction in cross-sectional area at points of curvature, in which latter event the minimum radius shall be one-sixteenth inch. U-bolts shall have a diameter not less than required by the following table:

DIAMETER OF U-BOLTS IN INCHES

Weights in pounds of heaviest towed vehicle	Double or triple saddle-mount			
	Front mount	Middle or front mount	Rear mount	Single saddle-mount ¹
Up to 5,000 .	0.625	0.5625	0.0500	0.500
5,000 and over.....	0.6875	0.625	0.5625	0.5625

¹The total weight of all the vehicles being towed shall govern. If other devices are used to accomplish the same purposes as U-bolts they shall have at least equivalent strength of U-bolts made of mild steel. Cast iron shall not be used for clamps or any other holding devices.

(3) **U-bolts and points of support, location.** The distance between the most widely separated U-bolts shall not be less than 9 inches. The distance between the widely separated points where the upper-half supports the towed vehicle shall not be less than 9 inches, except that saddle-mounts employing ball and socket joints shall employ a device which clamps the axle of the towed vehicle throughout a length of not less than 5 inches.

(4) **Cradle-type upper-halves, specifications.** Upper-halves of the cradle-type using vertical members to restrain the towed vehicle from relative movement in the direction of motion of the vehicles shall be substantially constructed and adequate for the purpose. Such cradle-mounts shall be equipped with at least one bolt or equivalent means to provide against relative vertical movement between the upper-half and the towed vehicle. Bolts, if used, shall be at least one-half inch in diameter. Devices using equivalent means shall have at least equivalent strength. The means used to provide against relative vertical motion between the upper-half and the towed vehicle shall be such as not to permit a relative motion of over one-half inch. The distance between the most widely separated points of support between the upper-half and the towed vehicle shall be at least 9 inches.

¹See footnote 1 to §393.24(c).

Regulations

(5) **Lateral movement of towed vehicle.** (i) Towed vehicles having a straight axle or an axle having a drop of less than 3 inches, unless the saddle-mount is constructed in accordance with paragraph (m)(2) of this section, shall be securely fastened by means of chains or cables to the upper-half so as to insure against relative lateral motion between the towed vehicle and the upper-half. The chains or cables shall be at least $\frac{3}{16}$ -inch diameter and secured by bolts of at least equal diameter.

(ii) Towed vehicles with an axle with a drop of 3 inches or more, or connected by a saddle-mount constructed in accordance with paragraph (m)(2) of this section, need not be restrained by chains or cables provided that the upper-half is so designed as to provide against such relative motion.

(iii) Chains or cables shall not be required if the upper-half is so designed as positively to provide against lateral movement of the axle.

(k) **Requirements for lower half of saddle-mounts.** The lower half of any saddle-mount shall comply with the following requirements:

(1) **U-bolts or other attachments.** U-bolts used to attach the lower half to the towing vehicle shall be made of steel rod, free of defects, so shaped as to avoid at any point a radius of less than 1 inch: Provided, however, That a lesser radius may be utilized if the U-bolt is so fabricated as not to cause more than 5 percent reduction in cross-sectional area at points of curvature, in which latter event the minimum radius shall be one-sixteenth inch. U-bolts shall have a total cross-sectional area not less than as required by the following table:

TOTAL CROSS-SECTIONAL AREA OF U-BOLTS IN SQUARE INCHES

Weight in pounds of heaviest towed vehicle	Double or triple saddle-mount			
	Front mount	Middle or front mount	Rear mount	Single saddle-mount ¹
Up to 5,000.....	1.2	1.0	0.8	0.8
5,000 and over	1.4	1.2	1.0	1.0

¹The total weight of all the vehicles being towed shall govern. If other devices are used to accomplish the same purposes as U-bolts they shall have at least equivalent strength of U-bolts made of mild steel. Cast iron shall not be used for clamps or any other holding devices.

(2) **Shifting.** Adequate provision shall be made by design and installation to provide against relative movement between the lower-half and the towing vehicle especially during periods of rapid acceleration and deceleration. To insure against shifting, designs of the tripod type shall be equipped with adequate and securely fastened hold-back chains or similar devices.

(3) **Swaying.** (i) Adequate provision shall be made by design and installation to provide against swaying or lateral movement of the towed vehicle relative to the towing vehicle. To insure against swaying, lower-halves designed with cross-members attached to but separable from vertical members shall have such cross-members fastened to the vertical members by at least two bolts on each side. Such bolts shall be of at least equivalent cross-sectional area as those required for U-bolts for the corresponding saddle-mount as given in the table in paragraph (k)(1) of this section. The minimum distance

between the most widely separated points of support of the cross-member by the vertical member shall be three inches as measured in a direction parallel to the longitudinal axis of the towing vehicle.

(ii) The lower-half shall have a bearing surface on the frame of the towing vehicle of such dimensions that the pressure exerted by the lower-half upon the frame of the towing vehicle shall not exceed 200 pounds per square inch under any conditions of static loading. Hardwood blocks or blocks of other suitable material, such as hard rubber, aluminum or brakelining, if used between the lower-half and the frame of the towing vehicle shall be at least $\frac{1}{2}$ inch thick, 3 inches wide, and a combined length of 6 inches.

(iii) Under no condition shall the highest point of support of the towed vehicle by the upper-half be more than 24 inches, measured vertically, above the top of the frame of the towing vehicle, measured at the point where the lower-half rests on the towing vehicle.

(4) **Wood blocks.** (i) Hardwood blocks of good quality may be used to build up the height of the front end of the towed vehicle, provided that the total height of such wood blocks shall not exceed 8 inches and not over two separate pieces are placed upon each other to obtain such height; however, hardwood blocks, not over 4 in number, to a total height not to exceed 14 inches, may be used if the total cross-sectional area of the U-bolts used to attach the lower-half of the towing vehicle is at least 50 percent greater than that required by the table contained in paragraph (k)(1) of this section, or, if other devices are used in lieu of U-bolts, they shall provide for as great a resistance to bending as is provided by the larger U-bolts above prescribed.

(ii) Hardwood blocks must be at least 4 inches in width and the surfaces between blocks or block and lower-half or block and upper-half shall be planed and so installed and maintained as to minimize any tendency of the towed vehicle to sway or rock.

(5) **Cross-member, general requirements.** The cross-member, which is that part of the lower-half used to distribute the weight of the towed vehicle equally to each member of the frame of the towing vehicle, if used, shall be structurally adequate and properly installed and maintained adequately to perform this function.

(6) **Cross-member, use of wood.** No materials, other than suitable metals, shall be used as the cross-member, and wood may not be used structurally in any manner that will result in its being subject to tensile stresses. Wood may be used in cross-members if supported throughout its length by suitable metal cross-members.

(7) **Lower-half strength.** The lower-half shall be capable of supporting the loads given in the following table. For the purpose of test, the saddle-mount shall be mounted as normally operated and the load applied through the upper-half:

Vehicle Maintenance Pro

MINIMUM TEST LOAD IN POUNDS

Weight in pounds of heaviest towed vehicle	Double or triple saddle-mount			
	Front mount	Middle or front mount	Rear mount	Single saddle-mount ¹
Up to 5,000	15,000	10,000	5,000	5,000
5,000 and over	30,000	20,000	10,000	10,000

¹ The total weight of all the vehicles being towed shall govern.

(1) **Requirements for kingpins of saddle-mounts.** The kingpin of any saddle-mount shall comply with the following requirements:

(1) **Kingpin size.** (i) Kingpins shall be constructed of steel suitable for the purpose, free of defects, and having a diameter not less than required by the following table:

DIAMETER OF SOLID KINGPIN IN INCHES

Weight in pounds of heaviest towed vehicle	Double or triple saddle-mount							
	Front mount		Middle or front mount		Rear mount		Single saddle-mount ¹	
	Mild steel	H.T.S. ²	Mild steel	H.T.S. ²	Mild steel	H.T.S. ²	Mild steel	H.T.S.
Up to 5,000	1.125	1.000	1.000	0.875	0.875	0.750	0.875	0.750
5,000 & over	1.500	1.125	1.250	1.000	1.000	0.875	1.000	0.875

¹The total weight of all the vehicles being towed shall govern.

²High tensile steel is steel having a minimum ultimate strength of 65,000 pounds per square inch.

(ii) If a ball and socket joint is used in place of a kingpin, the diameter of the neck of the ball shall be at least equal to the diameter of the corresponding solid kingpin given in the above table. If hollow kingpins are used, the metallic cross-sectional area shall be at least equal to the cross-sectional area of the corresponding solid kingpin.

(2) **Kingpin fit.** If a kingpin bushing is not used, the kingpin shall fit snugly into the upper and lower-halves but shall not bind. Those portions of the upper or lower-halves in moving contact with the kingpin shall be smoothly machined with no rough or sharp edges. The bearing surface thus provided shall not be less in depth than the radius of the kingpin.

(3) **Kingpin bushing on saddle-mounts.** The kingpin of all new saddle-mounts acquired and used shall be snugly enclosed in a bushing at least along such length of the kingpin as may be in moving contact with either the upper or lower-halves. The bearing surface thus provided shall not be less in depth than the radius of the kingpin.

(4) **Kingpin to restrain vertical motion.** The kingpin shall be so designed and installed as to restrain the upper-half from moving in a vertical direction relative to the lower-half.

(m) **Additional requirements for saddle-mounts.** Saddle-mounts shall comply with the following requirements:

(1) **Bearing surface between upper and lower-halves.** The upper and lower-halves shall be so constructed and connected that the bearing surface between the two halves shall not be less than 16 square

inches under any conditions of angularity between the towing and towed vehicles: Provided, however, That saddle-mounts using a ball and socket joint shall have a ball of such dimension that the static bearing load shall not exceed 800 pounds per square inch, based on the projected cross-sectional area of the ball: And further provided, That saddle-mounts having the upper-half supported by ball, taper, or roller-bearings shall not have such bearings loaded beyond the limits prescribed for such bearings by the manufacturer thereof. The upper-half shall rest evenly and smoothly upon the lower-half and the contact surfaces shall be lubricated and maintained so that there shall be a minimum of frictional resistance between the parts.

(2) **Saddle-mounts, angularity.** All saddle-mounts acquired and used shall provide for angularity between the towing and towed vehicles due to vertical curvatures of the highway. Such means shall not depend upon either the looseness or deformation of the parts of either the saddle-mount or the vehicles to provide for such angularity.

(3) **Tracking.** The saddle-mount shall be so designed, constructed, maintained, and installed that the towed vehicle or vehicles will follow substantially in the path of the towing vehicle without swerving. Towed vehicles shall not deviate more than 3 inches to either side of the path of the towing vehicle when moving in a straight line.

(4) **Prevention of frame bending.** Where necessary, provision shall be made to prevent the bending of the frame of the towing vehicle by insertion of suitable blocks inside the frame channel to prevent kinking. The saddle-mount shall not be so located as to cause deformation of the frame by reason of cantilever action.

(5) **Extension of frame.** No saddle-mount shall be located at a point to the rear of the frame of a towing vehicle.

(6) **Nuts, secured.** All nuts used on bolts, U-bolts, kingpins, or in any other part of the saddle-mount shall be secured against accidental disconnection by means of cotter-keys, lock-washers, double nuts, safety nuts, or equivalent means. Parts shall be so designed and installed that nuts shall be fully engaged.

(7) **Inspection of all parts.** The saddle-mount shall be so designed that it may be disassembled and each separate part inspected for worn, bent, cracked, broken, or missing parts.

(8) **Saddle-mounts, marking.** Every new saddle-mount acquired and used in driveaway-towaway operations by a motor carrier shall have the upper-half and the lower-half separately marked with the following certification of the manufacturer thereof (or words of equivalent meaning).

This saddle-mount complies with the requirements of the Federal Motor Carrier Safety Administration for vehicles up to 5,000 pounds (or over 5,000 pounds):

Manufactured _____

(Month and year)

by _____

(Name of manufacturer)

Regulations

(n) Requirements for devices used to connect motor vehicles or parts of motor vehicles together to form one vehicle—

(1) **Front axle attachment.** The front axle of one motor vehicle intended to be coupled with another vehicle as defined in paragraph (g)(2)(ii) of this section shall be attached with U-bolts meeting the requirements of paragraph (j)(2) of this section.

(2) **Rear axle attachment.** The rear axle of one vehicle shall be coupled to the frame of the other vehicle by means of a connecting device which when in place forms a rectangle. The device shall be composed of two pieces, top and bottom. The device shall be made of 4-inch by ½-inch steel bar bent to shape and shall have the corners reinforced with a plate at least 3 inches by ½ inch by 8 inches long. The device shall be bolted together with ¾-inch bolts and at least three shall be used on each side. Wood may be used as spacers to keep the frames apart and it shall be at least 4 inches square.

Subpart G—Miscellaneous parts and accessories

§393.75 Tires.

(a) No motor vehicle shall be operated on any tire that (1) has body ply or belt material exposed through the tread or sidewall, (2) has any tread or sidewall separation, (3) is flat or has an audible leak, or (4) has a cut to the extent that the ply or belt material is exposed.

(b) Any tire on the front wheels of a bus, truck, or truck tractor shall have a tread groove pattern depth of at least ¼ of an inch when measured at any point on a major tread groove. The measurements shall not be made where tie bars, humps, or fillets are located.

(c) Except as provided in paragraph (b) of this section, tires shall have a tread groove pattern depth of at least ⅜ of an inch when measured in a major tread groove. The measurement shall not be made where tie bars, humps or fillets are located.

(d) No bus shall be operated with regrooved, recapped or retreaded tires on the front wheels.

(e) A regrooved tire with a load-carrying capacity equal to or greater than 2,232 kg (4,920 pounds) shall not be used on the front wheels of any truck or truck tractor.

(f) **Tire loading restrictions (except on manufactured homes).** No motor vehicle (except manufactured homes, which are governed by paragraph (g) of this section) shall be operated with tires that carry a weight greater than that marked on the side-wall of the tire or, in the absence of such a marking, a weight greater than that specified for the tires in any of the publications of any of the organizations listed in Federal Motor Vehicle Safety Standard No. 119 (49 CFR 571.119, S5.1(b)) unless:

(1) The vehicle is being operated under the terms of a special permit issued by the State; and

(2) The vehicle is being operated at a reduced speed to compensate for the tire loading in excess of the manufacturer's rated capacity for the tire. In no case shall the speed exceed 80 km/hr (50 mph).

(g)(1) **Tire loading restrictions for manufactured**

homes built before January 1, 2002. Manufactured homes that are labeled pursuant to 24 CFR 3282.362(c)(2)(i) before January 1, 2002, must not be transported on tires that are loaded more than 18 percent over the load rating marked on the sidewall of the tire or, in the absence of such a marking, more than 18 percent over the load rating specified in any of the publications of any of the organizations listed in FMVSS No. 119 (49 CFR 571.119, S5.1(b)). Manufactured homes labeled before January 1, 2002, transported on tires overloaded by 9 percent or more must not be operated at speeds exceeding 80 km/hr (50 mph).

(2) **Tire loading restrictions for manufactured homes built on or after January 1, 2002.** Manufactured homes that are labeled pursuant to 24 CFR 3282.362(c)(2)(i) on or after January 1, 2002, must not be transported on tires loaded beyond the load rating marked on the sidewall of the tire or, in the absence of such a marking, the load rating specified in any of the publications of any of the organizations listed in FMVSS No. 119 (49 CFR 571.119, S5.1(b)).

(h) **Tire inflation pressure.** (1) No motor vehicle shall be operated on a tire which has a cold inflation pressure less than that specified for the load being carried.

(2) If the inflation pressure of the tire has been increased by heat because of the recent operation of the vehicle, the cold inflation pressure shall be estimated by subtracting the inflation buildup factor shown in Table 1 from the measured inflation pressure.

TABLE 1—INFLATION PRESSURE MEASUREMENT
CORRECTION FOR HEAT

Average speed of vehicle in the previous hour	Minimum inflation pressure buildup	
	Tires with 1,814 kg (4,000 lbs.) maximum load rating or less	Tires with over 1,814 kg (4,000 lbs.) load rating
66–88.5 km/hr (41–55 mph)	34.5 kPa (5 psi)	103.4 kPa (15 psi).

§393.76 Sleeper berths.

(a) **Dimensions—(1) Size.** A sleeper berth must be at least the following size:

Date of installation on motor vehicle	Length measured on centerline of longitudinal axis (inches)	Width measured on centerline of transverse axis (inches)	Height measured from highest point of top of mattress (inches) ¹
Before January 1, 1953	72	18	18
After December 31, 1952	75	21	21
and before October 1, 1975			
After September 30, 1975	75	24	24

¹In the case of a sleeper berth which utilizes an adjustable mechanical suspension system, the required clearance can be measured when the suspension system is adjusted to the height to which it would settle when occupied by a driver.

Vehicle Maintenance Pro

(2) **Shape.** A sleeper berth installed on a motor vehicle on or after January 1, 1953 must be of generally rectangular shape, except that the horizontal corners and the roof corners may be rounded to radii not exceeding 10-½ inches.

(3) **Access.** A sleeper berth must be constructed so that an occupant's ready entrance to, and exit from, the sleeper berth is not unduly hindered.

(b) **Location.** (1) A sleeper berth must not be installed in or on a semitrailer or a full trailer other than a house trailer.

(2) A sleeper berth located within the cargo space of a motor vehicle must be securely compartmentalized from the remainder of the cargo space. A sleeper berth installed on or after January 1, 1953 must be located in the cab or immediately adjacent to the cab and must be securely fixed with relation to the cab.

(c) **Exit from the berth.** (1) Except as provided in paragraph (c)(2) of this section, there must be a direct and ready means of exit from a sleeper berth into the driver's seat or compartment. If the sleeper berth was installed on or after January 1, 1963, the exit must be a doorway or opening at least 18 inches high and 36 inches wide. If the sleeper berth was installed before January 1, 1963, the exit must have sufficient area to contain an ellipse having a major axis of 24 inches and a minor axis of 16 inches.

(2) A sleeper berth installed before January 1, 1953 must either:

(i) Conform to the requirements of paragraph (c)(1) of this section; or

(ii) Have at least two exits, each of which is at least 18 inches high and 21 inches wide, located at opposite ends of the vehicle and useable by the occupant without the assistance of any other person.

(d) **Communication with the driver.** A sleeper berth which is not located within the driver's compartment and has no direct entrance into the driver's compartment must be equipped with a means of communication between the occupant and the driver. The means of communication may consist of a telephone, speaker tube, buzzer, pull cord, or other mechanical or electrical device.

(e) **Equipment.** A sleeper berth must be properly equipped for sleeping. Its equipment must include:

(1) Adequate bedclothing and blankets; and

(2) Either:

(i) Springs and a mattress; or

(ii) An innerspring mattress; or

(iii) A cellular rubber or flexible foam mattress at least four inches thick; or

(iv) A mattress filled with a fluid and of sufficient thickness when filled to prevent "bottoming-out" when occupied while the vehicle is in motion.

(f) **Ventilation.** A sleeper berth must have louvers or other means of providing adequate ventilation. A sleeper berth must be reasonably tight against dust and rain.

(g) **Protection against exhaust and fuel leaks and**

exhaust heat. A sleeper berth must be located so that leaks in the vehicle's exhaust system or fuel system do not permit fuel, fuel system gases, or exhaust gases to enter the sleeper berth. A sleeper berth must be located so that it will not be overheated or damaged by reason of its proximity to the vehicle's exhaust system.

(h) **Occupant restraint.** A motor vehicle manufactured on or after July 1, 1971, and equipped with a sleeper berth must be equipped with a means of preventing ejection of the occupant of the sleeper berth during deceleration of the vehicle. The restraint system must be designed, installed, and maintained to withstand a minimum total force of 6,000 pounds applied toward the front of the vehicle and parallel to the longitudinal axis of the vehicle.

§393.77 Heaters.

On every motor vehicle, every heater shall comply with the following requirements:

(a) **Prohibited types of heaters.** The installation or use of the following types of heaters is prohibited:

(1) **Exhaust heaters.** Any type of exhaust heater in which the engine exhaust gases are conducted into or through any space occupied by persons or any heater which conducts engine compartment air into any such space.

(2) **Unenclosed flame heaters.** Any type of heater employing a flame which is not fully enclosed, except that such heaters are not prohibited when used for heating the cargo of tank motor vehicles.

(3) **Heaters permitting fuel leakage.** Any type of heater from the burner of which there could be spillage or leakage of fuel upon the tilting or overturning of the vehicle in which it is mounted.

(4) **Heaters permitting air contamination.** Any heater taking air, heated or to be heated, from the engine compartment or from direct contact with any portion of the exhaust system; or any heater taking air in ducts from the outside atmosphere to be conveyed through the engine compartment, unless said ducts are so constructed and installed as to prevent contamination of the air so conveyed by exhaust or engine compartment gases.

(5) **Solid fuel heaters except wood charcoal.** Any stove or other heater employing solid fuel except wood charcoal.

(6) **Portable heaters.** Portable heaters shall not be used in any space occupied by persons except the cargo space of motor vehicles which are being loaded or unloaded.

(b) **Heater specifications.** All heaters shall comply with the following specifications:

(1) **Heating elements, protection.** Every heater shall be so located or protected as to prevent contact therewith by occupants, unless the surface temperature of the protecting grilles or of any exposed portions of the heaters, inclusive of exhaust stacks, pipes, or conduits shall be lower than would cause contact burns. Adequate protection shall be afforded against igniting parts of the vehicle or burning occupants by direct radiation. Wood charcoal heaters shall be enclosed within a metal barrel,

Regulations

drum, or similar protective enclosure which enclosure shall be provided with a securely fastened cover.

(2) **Moving parts, guards.** Effective guards shall be provided for the protection of passengers or occupants against injury by fans, belts, or any other moving parts.

(3) **Heaters, secured.** Every heater and every heater enclosure shall be securely fastened to the vehicle in a substantial manner so as to provide against relative motion within the vehicle during normal usage or in the event the vehicle overturns. Every heater shall be so designed, constructed, and mounted as to minimize the likelihood of disassembly of any of its parts, including exhaust stacks, pipes, or conduits, upon overturn of the vehicle in or on which it is mounted. Wood charcoal heaters shall be secured against relative motion within the enclosure required by paragraph (c)(1) of this section, and the enclosure shall be securely fastened to the motor vehicle.

(4) **Relative motion between fuel tank and heater.** When either in normal operation or in the event of overturn, there is or is likely to be relative motion between the fuel tank for a heater and the heater, or between either of such units and the fuel lines between them, a suitable means shall be provided at the point of greatest relative motion so as to allow this motion without causing failure of the fuel lines.

(5) **Operating controls to be protected.** On every bus designed to transport more than 15 passengers, including the driver, means shall be provided to prevent unauthorized persons from tampering with the operating controls. Such means may include remote control by the driver; installation of controls at inaccessible places; control of adjustments by key or keys; enclosure of controls in a locked space, locking of controls, or other means of accomplishing this purpose.

(6) **Heater, hoses.** Hoses for all hot water and steam heater systems shall be specifically designed and constructed for that purpose.

(7) **Electrical apparatus.** Every heater employing any electrical apparatus shall be equipped with electrical conductors, switches, connectors, and other electrical parts of ample current-carrying capacity to provide against overheating; any electric motor employed in any heater shall be of adequate size and so located that it will not be overheated; electrical circuits shall be provided with fuses and/or circuit breakers to provide against electrical overloading; and all electrical conductors employed in or leading to any heater shall be secured against dangling, chafing, and rubbing and shall have suitable protection against any other condition likely to produce short or open circuits.

NOTE: Electrical parts certified as proper for use by Underwriters' Laboratories, Inc., shall be deemed to comply with the foregoing requirements.

(8) **Storage battery caps.** If a separate storage battery is located within the personnel or cargo space, such battery shall be securely mounted and equipped with nonspill filler caps.

(9) **Combustion heater exhaust construction.** Every heater employing the combustion of oil, gas, liquefied petroleum gas, or any other combustible material shall be provided with substantial means of conducting

the products of combustion to the outside of the vehicle: Provided, however, That this requirement shall not apply to heaters used solely to heat the cargo space of motor vehicles where such motor vehicles or heaters are equipped with means specifically designed and maintained so that the carbon monoxide concentration will never exceed 0.2 percent in the cargo space. The exhaust pipe, stack, or conduit if required shall be sufficiently substantial and so secured as to provide reasonable assurance against leakage or discharge of products of combustion within the vehicle and, if necessary, shall be so insulated as to make unlikely the burning or charring of parts of the vehicle by radiation or by direct contact. The place of discharge of the products of combustion to the atmosphere and the means of discharge of such products shall be such as to minimize the likelihood of their reentry into the vehicle under all operating conditions.

(10) **Combustion chamber construction.** The design and construction of any combustion-type heater except cargo space heaters permitted by the proviso of paragraph (c)(9) of this section and unenclosed flame heaters used for heating cargo of tank motor vehicles shall be such as to provide against the leakage of products of combustion into air to be heated and circulated. The material employed in combustion chambers shall be such as to provide against leakage because of corrosion, oxidation or other deterioration. Joints between combustion chambers and the air chambers with which they are in thermal and mechanical contact shall be so designed and constructed as to prevent leakage between the chambers and the materials employed in such joints shall have melting points substantially higher than the maximum temperatures likely to be attained at the points of jointure.

(11) **Heater fuel tank location.** Every bus designed to transport more than 15 passengers, including the driver, with heaters of the combustion type shall have fuel tanks therefor located outside of and lower than the passenger space. When necessary, suitable protection shall be afforded by shielding or other means against the puncturing of any such tank or its connections by flying stones or other objects.

(12) **Heater, automatic fuel control.** Gravity or siphon feed shall not be permitted for heaters using liquid fuels. Heaters using liquid fuels shall be equipped with automatic means for shutting off the fuel or for reducing such flow of fuel to the smallest practicable magnitude, in the event of overturn of the vehicle. Heaters using liquefied petroleum gas as fuel shall have the fuel line equipped with automatic means at the source of supply for shutting off the fuel in the event of separation, breakage, or disconnection of any of the fuel lines between the supply source and the heater.

(13) **"Tell-tale" indicators.** Heaters subject to paragraph (b)(14) of this section and not provided with automatic controls shall be provided with "tell-tale" means to indicate to the driver that the heater is properly functioning. The requirement shall not apply to heaters used solely for the cargo space in semitrailers or full trailers.

(14) **Shut-off control.** Automatic means, or manual means if the control is readily accessible to the driver

Vehicle Maintenance Pro

without moving from the driver's seat, shall be provided to shut off the fuel and electrical supply in case of failure of the heater to function for any reason, or in case the heater should function improperly or overheat. This requirement shall not apply to wood charcoal heaters or to heaters used solely to heat the contents of cargo tank motor vehicles, but wood charcoal heaters must be provided with a controlled method of regulating the flow of combustion air.

(15) **Certification required.** Every combustion-type heater, except wood charcoal heaters, the date of manufacture of which is subsequent to December 31, 1952, and every wood charcoal heater, the date of manufacture of which is subsequent to September 1, 1953, shall be marked plainly to indicate the type of service for which such heater is designed and with a certification by the manufacturer that the heater meets the applicable requirements for such use. For example, "Meets I.C.C. Bus Heater Requirements," "Meets I.C.C. Flue-Vented Cargo Space Heater Requirements," and after December 31, 1967, such certification shall read "Meets FMCSA Bus Heater Requirements," "Meets FMCSA Flue-Vented Cargo Space Heater Requirements," etc.

(c) **Exception.** The certification for a catalytic heater which is used in transporting flammable liquid or gas shall be as prescribed under §177.834(l) of this title.

§393.78 Windshield wiping and washing systems.

(a) **Vehicles manufactured on or after December 25, 1968.** Each bus, truck, and truck-tractor manufactured on or after December 25, 1968, must have a windshield wiping system that meets the requirements of FMVSS No. 104 (S4.1) in effect on the date of manufacture. Each of these vehicles must have a windshield washing system that meets the requirements of FMVSS No. 104 (S4.2.2) in effect on the date of manufacture.

(b) **Vehicles manufactured between June 30, 1953, and December 24, 1968.** Each truck, truck-tractor, and bus manufactured between June 30, 1953, and December 24, 1968, shall be equipped with a power-driven windshield wiping system with at least two wiper blades, one on each side of the centerline of the windshield. Motor vehicles which depend upon vacuum to operate the windshield wipers, shall have the wiper system constructed and maintained such that the performance of the wipers will not be adversely affected by a change in the intake manifold pressure.

(c) **Driveaway-towaway operations.** Windshield wiping and washing systems need not be in working condition while a commercial motor vehicle is being towed in a driveaway-tow-away operation.

§393.79 Windshield defrosting and defogging systems.

(a) **Vehicles manufactured on or after December 25, 1968.** Each bus, truck, and truck-tractor manufactured on or after December 25, 1968, must have a windshield defrosting and defogging system that meets the requirements of FMVSS No. 103 in effect on the date of manufacture.

(b) **Vehicles manufactured before December 25, 1968.** Each bus, truck, and truck-tractor shall be equipped

with a means for preventing the accumulation of ice, snow, frost, or condensation that could obstruct the driver's view through the windshield while the vehicle is being driven.

§393.80 Rear-vision mirrors.

(a) Every bus, truck, and truck tractor shall be equipped with two rear-vision mirrors, one at each side, firmly attached to the outside of the motor vehicle, and so located as to reflect to the driver a view of the highway to the rear, along both sides of the vehicle. All such regulated rear-vision mirrors and their replacements shall meet, as a minimum, the requirements of FMVSS No. 111 (49 CFR 571.111) in force at the time the vehicle was manufactured.

(b) **Exceptions.** (1) Mirrors installed on a vehicle manufactured prior to January 1, 1981, may be continued in service, provided that if the mirrors are replaced they shall be replaced with mirrors meeting, as a minimum, the requirements of FMVSS No. 111 (49 CFR 571.111) in force at the time the vehicle was manufactured.

(2) Only one outside mirror shall be required, which shall be on the driver's side, on trucks which are so constructed that the driver has a view to the rear by means of an interior mirror.

(3) In driveaway-towaway operations, the driven vehicle shall have at least one mirror furnishing a clear view to the rear.

§393.81 Horn.

Every bus, truck, truck tractor, and every driven motor vehicle in driveaway-towaway operations shall be equipped with a horn and actuating elements which shall be in such condition as to give an adequate and reliable warning signal.

§393.82 Speedometer.

Each bus, truck, and truck-tractor must be equipped with a speedometer indicating vehicle speed in miles per hour and/or kilometers per hour. The speedometer must be accurate to within plus or minus 8 km/hr (5 mph) at a speed of 80 km/hr (50 mph).

§393.83 Exhaust systems.

(a) Every motor vehicle having a device (other than as part of its cargo) capable of expelling harmful combustion fumes shall have a system to direct the discharge of such fumes. No part shall be located where its location would likely result in burning, charring, or damaging the electrical wiring, the fuel supply, or any combustible part of the motor vehicle.

(b) No exhaust system shall discharge to the atmosphere at a location immediately below the fuel tank or the fuel tank filler pipe.

(c) The exhaust system of a bus powered by a gasoline engine shall discharge to the atmosphere at or within 6 inches forward of the rearmost part of the bus.

(d) The exhaust system of a bus using fuels other than gasoline shall discharge to the atmosphere either:

(1) At or within 15 inches forward of the rearmost part of the vehicle; or

Regulations

(2) To the rear of all doors or windows designed to be open, except windows designed to be opened solely as emergency exits.

(e) The exhaust system of every truck and truck tractor shall discharge to the atmosphere at a location to the rear of the cab or, if the exhaust projects above the cab, at a location near the rear of the cab.

(f) No part of the exhaust system shall be temporarily repaired with wrap or patches.

(g) No part of the exhaust system shall leak or discharge at a point forward of or directly below the driver/sleeper compartment. The exhaust outlet may discharge above the cab/sleeper roofline.

(h) The exhaust system must be securely fastened to the vehicle.

(i) Exhaust systems may use hangers which permit required movement due to expansion and contraction caused by heat of the exhaust and relative motion between engine and chassis of a vehicle.

§393.84 Floors.

The flooring in all motor vehicles shall be substantially constructed, free of unnecessary holes and openings, and shall be maintained so as to minimize the entrance of fumes, exhaust gases, or fire. Floors shall not be permeated with oil or other substances likely to cause injury to persons using the floor as a traction surface.

§393.85 [Reserved]

§393.86 Rear impact guards and rear end protection.

(a)(1) **General requirements for trailers and semitrailers manufactured on or after January 26, 1998.** Each trailer and semitrailer with a gross vehicle weight rating of 4,536 kg (10,000 pounds) or more, and manufactured on or after January 26, 1998, must be equipped with a rear impact guard that meets the requirements of Federal Motor Vehicle Safety Standard No. 223 (49 CFR 571.223) in effect at the time the vehicle was manufactured. When the rear impact guard is installed on the trailer or semitrailer, the vehicle must, at a minimum, meet the requirements of FMVSS No. 224 (49 CFR 571.224) in effect at the time the vehicle was manufactured. The requirements of paragraph (a) of this section do not apply to pole trailers (as defined in §390.5 of this chapter); pulpwood trailers, low chassis vehicles, special purpose vehicles, wheels back vehicles (as defined in §393.5); and trailers towed in driveaway-towaway operations (as defined in §390.5).

(2) **Impact Guard Width.** The outermost surfaces of the horizontal member of the guard must extend to within 100 mm (4 inches) of the side extremities of the vehicle. The outermost surface of the horizontal member shall not extend beyond the side extremity of the vehicle.

(3) **Guard Height.** The vertical distance between the bottom edge of the horizontal member of the guard and the ground shall not exceed 560 mm (22 inches) at any point across the full width of the member. Guards with rounded corners may curve upward within 255 mm (10 inches) of the longitudinal vertical planes that are tangent to the side extremities of the vehicle.

(4) **Guard Rear Surface.** At any height 560 mm (22 inches) or more above the ground, the rearmost surface of the horizontal member of the guard must be within 305 mm (12 inches) of the rear extremity of the vehicle. This paragraph shall not be construed to prohibit the rear surface of the guard from extending beyond the rear extremity of the vehicle. Guards with rounded corners may curve forward within 255 mm (10 inches) of the side extremity.

(5) **Cross-Sectional Vertical Height.** The horizontal member of each guard must have a cross sectional vertical height of at least 100 mm (3.94 inches) at any point across the guard width.

(6) **Certification and labeling requirements for rear impact protection guards.** Each rear impact guard used to satisfy the requirements of paragraph (a)(1) of this section must be permanently marked or labeled as required by FMVSS No. 223 (49 CFR 571.223, S5.3). The label must be on the forward-facing surface of the horizontal member of the guard, 305 mm (12 inches) inboard of the right end of the guard. The certification label must contain the following information:

(i) The impact guard manufacturer's name and address;

(ii) The statement "Manufactured in _____" (inserting the month and a year that the guard was manufactured); and,

(iii) The letters "DOT", constituting a certification by the guard manufacturer that the guard conforms to all requirements of FMVSS No. 223.

(b)(1) **Requirements for motor vehicles manufactured after December 31, 1952 (except trailers or semitrailers manufactured on or after January 26, 1998).** Each motor vehicle manufactured after December 31, 1952, (except truck tractors, pole trailers, pulpwood trailers, or vehicles in driveaway-towaway operations) in which the vertical distance between the rear bottom edge of the body (or the chassis assembly if the chassis is the rearmost part of the vehicle) and the ground is greater than 76.2 cm (30 inches) when the motor vehicle is empty, shall be equipped with a rear impact guard(s). The rear impact guard(s) must be installed and maintained in such a manner that:

(i) The vertical distance between the bottom of the guard(s) and the ground does not exceed 76.2 cm (30 inches) when the motor vehicle is empty;

(ii) The maximum lateral distance between the closest points between guards, if more than one is used, does not exceed 61 cm (24 inches);

(iii) The outermost surfaces of the horizontal member of the guard are no more than 45.7 cm (18 inches) from each side extremity of the motor vehicle;

(iv) The impact guard(s) are no more than 61 cm (24 inches) forward of the rear extremity of the motor vehicle.

(2) **Construction and Attachment.** The rear impact guard(s) must be substantially constructed and attached by means of bolts, welding, or other comparable means.

(3) **Vehicle Components and Structures that may be used to satisfy the requirements of paragraph**

Vehicle Maintenance Pro

(b) of this section. Low chassis vehicles, special purpose vehicles, or wheels back vehicles constructed and maintained so that the body, chassis, or other parts of the vehicle provide the rear end protection comparable to impact guard(s) conforming to the requirements of paragraph (b)(1) of this section shall be considered to be in compliance with those requirements.

§393.87 Warning flags on projecting loads.

(a) Any commercial motor vehicle transporting a load which extends beyond the sides by more than 102 mm (4 inches) or more than 1,219 mm (4 feet) beyond the rear must have the extremities of the load marked with red or orange fluorescent warning flags. Each warning flag must be at least 457 mm (18 inches) square.

(b) **Position of flags.** There must be a single flag at the extreme rear if the projecting load is two feet wide or less. Two warning flags are required if the projecting load is wider than two feet. Flags must be located to indicate maximum width of loads which extend beyond the sides and/or rear of the vehicle.

§393.88 Television receivers.

Any motor vehicle equipped with a television viewer, screen or other means of visually receiving a television broadcast shall have the viewer or screen located in the motor vehicle at a point to the rear of the back of the driver's seat if such viewer or screen is in the same compartment as the driver and the viewer or screen shall be so located as not to be visible to the driver, while he/she is driving the motor vehicle. The operating controls for the television receiver shall be so located that the driver cannot operate them without leaving the driver's seat.

§393.89 Buses, driveshaft protection.

Any driveshaft extending lengthways under the floor of the passenger compartment of a bus, shall be protected by means of at least one guard or bracket at that end of the shaft which is provided with a sliding connection (spline or other such device) to prevent the whipping of the shaft in the event of failure thereof or of any of its component parts. A shaft contained within a torque tube shall not require any such device.

§393.90 Buses, standee line or bar.

Except as provided below, every bus which is designed and constructed so as to allow standees, shall be plainly marked with a line of contrasting color at least 2 inches wide or equipped with some other means so as to indicate to any person that he/she is prohibited from occupying a space forward of a perpendicular plane drawn through the rear of the driver's seat and perpendicular to the longitudinal axis of the bus. Every bus shall have clearly posted at or near the front, a sign with letters at least one-half inch high stating that it is a violation of the Federal Motor Carrier Safety Administration's regulations for a bus to be operated with persons occupying the prohibited area. The requirements of this section shall not apply to any bus being transported in driveaway-towaway operation or to any level of the bus other than that level in which the driver is located nor shall they be construed to prohibit any seated person from occupying permanent seats located

in the prohibited area provided such seats are so located that persons sitting therein will not interfere with the driver's safe operation of the bus.

§393.91 Buses, aisle seats prohibited.

No bus shall be equipped with aisle seats unless such seats are so designed and installed as to automatically fold and leave a clear aisle when they are unoccupied. No bus shall be operated if any seat therein is not securely fastened to the vehicle.

§393.92 [Reserved]

§393.93 Seats, seat belt assemblies, and seat belt assembly anchorages.

(a) **Buses—(1) Buses manufactured on or after January 1, 1965, and before July 1, 1971.** After June 30, 1972, every bus manufactured on or after January 1, 1965, and before July 1, 1971, must be equipped with a Type 1 or Type 2 seat belt assembly that conforms to Federal Motor Vehicle Safety Standard No. 209¹ (§571.209) installed at the driver's seat and seat belt assembly anchorages that conform to the location and geometric requirements of Federal Motor Vehicle Safety Standard No. 210¹ (§571.210) for that seat belt assembly.

(2) **Buses manufactured on or after July 1, 1971.** Every bus manufactured on or after July 1, 1971, must conform to the requirements of Federal Motor Vehicle Safety Standard No. 208¹ (§571.208) (relating to installation of seat belt assemblies) and Federal Motor Vehicle Safety Standard No. 210¹ (§571.210) (relating to installation of seat belt assembly anchorages).

(3) **Buses manufactured on or after January 1, 1972.** Every bus manufactured on or after January 1, 1972, must conform to the requirements of Federal Motor Vehicle Safety Standard No. 207¹ (§571.207) (relating to seating systems).

(b) **Trucks and truck tractors. (1) Trucks and truck tractors manufactured on and after January 1, 1965, and before July 1, 1971.** Except as provided in paragraph (d) of this section, after June 30, 1972, every truck and truck tractor manufactured on or after January 1, 1965, and before July 1, 1971, must be equipped with a Type 1 or Type 2 seat belt assembly that conforms to Federal Motor Vehicle Safety Standard No. 209 (§571.209) installed at the driver's seat and at the right front outboard seat, if the vehicle has one, and seat belt assembly anchorages that conform to the location and geometric requirements of Federal Motor Vehicle Safety Standard No. 210 (§571.210) for each seat belt assembly that is required by this subparagraph.

(2) **Trucks and truck tractors manufactured on or after July 1, 1971.** Every truck and truck tractor manufactured on or after July 1, 1971, except a truck or truck tractor being transported in driveaway-towaway

¹Individual copies of Federal Motor Vehicle Safety Standards may be obtained from the National Highway Traffic Safety Administration, 1200 New Jersey Ave., SE., Washington, DC 20590-0001.

Regulations

operation and having an incomplete vehicle seating and cab configuration, must conform to the requirements of Federal Motor Vehicle Safety Standard No. 208¹ (§571.208) (relating to installation of seat belt assemblies) and Federal Motor Vehicle Safety Standard No. 210¹ (§571.210) (relating to installation of seat belt assembly anchorages).

(3) **Trucks and truck tractors manufactured on or after January 1, 1972.** Every truck and truck tractor manufactured on or after January 1, 1972, except a truck or truck tractor being transported in driveaway-towaway operation and having an incomplete vehicle seating and cab configuration, must conform to the requirements of Federal Motor Vehicle Safety Standard No. 207¹ (§571.207) (relating to seating systems).

(c) **Effective date of standards.** Whenever paragraph (a) or (b) of this section requires conformity to a Federal Motor Vehicle Safety Standard, the vehicle or equipment must conform to the version of the Standard that is in effect on the date the vehicle is manufactured or on the date the vehicle is modified to conform to the requirements of paragraph (a) or (b) of this section, whichever is later.

(d) Trucks and truck tractors manufactured on or after January 1, 1965, and before July 1, 1971, and operated in the State of Hawaii, must comply with the provisions of paragraph (b) of this section on and after January 1, 1976.

§393.94 Interior noise levels in power units.

(a) **Applicability of this section.** The interior noise level requirements apply to all trucks, truck-tractors, and buses.

(b) **General rule.** The interior sound level at the driver's seating position of a motor vehicle must not exceed 90 dB(A) when measured in accordance with paragraph (c) of this section.

(c) **Test procedure.** (1) Park the vehicle at a location so that no large reflecting surfaces, such as other vehicles, signboards, buildings, or hills, are within 50 feet of the driver's seating position.

(2) Close all vehicle doors, windows, and vents. Turn off all power-operated accessories.

(3) Place the driver in his/her normal seated position at the vehicle's controls. Evacuate all occupants except the driver and the person conducting the test.

(4) The sound level meters used to determine compliance with the requirements of this section must meet the American National Standards Institute "*Specification for Sound Level Meters*," ANSI S1.4-1983. (See §393.7(b) for information on the incorporation by reference and availability of this document.)

(5) Locate the microphone, oriented vertically upward, 6 inches to the right of, in the same plane as, and directly in line with, the driver's right ear.

(6) With the vehicle's transmission in neutral gear, accelerate its engine to either its maximum governed engine speed, if it is equipped with an engine governor, or its speed at its maximum rated horsepower, if it is not equipped with an engine governor. Stabilize the engine at that speed.

(7) Observe the A-weighted sound level reading on the meter for the stabilized engine speed condition. Record that reading, if the reading has not been influenced by extraneous noise sources such as motor vehicles operating on adjacent roadways.

(8) Return the vehicle's engine speed to idle and repeat the procedure specified in paragraphs (c)(6) and (7) of this section until two maximum sound levels within 2 dB of each other are recorded. Numerically average those two maximum sound level readings.

(9) The average obtained in accordance with paragraph (c)(8) of this section is the vehicle's interior sound level at the driver's seating position for the purpose of determining whether the vehicle conforms to the rule in paragraph (b) of this section. However, a 2dB tolerance over the sound level limitation specified in that paragraph is permitted to allow for variations in test conditions and variations in the capabilities of meters.

(10) If the motor vehicle's engine radiator fan drive is equipped with a clutch or similar device that automatically either reduces the rotational speed of the fan or completely disengages the fan from its power source in response to reduced engine cooling loads the vehicle may be parked before testing with its engine running at high idle or any other speed the operator may choose, for sufficient time but not more than 10 minutes, to permit the engine radiator fan to automatically disengage.

Subpart H—Emergency equipment

§393.95 Emergency equipment on all power units.

Each truck, truck tractor, and bus (except those towed in driveaway-towaway operations) must be equipped as follows:

(a) Fire Extinguishers

(1) Minimum ratings:

(i) A power unit that is used to transport hazardous materials in a quantity that requires placarding (See §177.823 of this title) must be equipped with a fire extinguisher having an Underwriters' Laboratories rating of 10 B:C or more.

(ii) A power unit that is not used to transport hazardous materials must be equipped with either:

(A) A fire extinguisher having an Underwriters' Laboratories rating of 5 B:C or more; or

(B) Two fire extinguishers, each of which has an Underwriters' Laboratories rating of 4 B:C or more.

(2) **Labeling and marking.** Each fire extinguisher required by this section must be labeled or marked by the manufacturer with its Underwriters' Laboratories rating.

(3) **Visual Indicators.** The fire extinguisher must be designed, constructed, and maintained to permit visual determination of whether it is fully charged.

(4) **Condition, location, and mounting.** The fire extinguisher(s) must be filled and located so that it is readily accessible for use. The extinguisher(s) must be securely mounted to prevent sliding, rolling, or vertical movement relative to the motor vehicle.

Vehicle Maintenance Pro

(5) **Extinguishing agents.** The fire extinguisher must use an extinguishing agent that does not need protection from freezing. Extinguishing agents must comply with the toxicity provisions of the Environmental Protection Agency's Significant New Alternatives Policy (SNAP) regulations under 40 CFR Part 82, Subpart G.

(6) **Exception.** This paragraph (a) does not apply to the driven unit in a driveaway-towaway operation.

(b) **Spare fuses.** Power units for which fuses are needed to operate any required parts and accessories must have at least one spare fuse for each type/size of fuse needed for those parts and accessories.

(c)–(e) [Reserved]

(f) **Warning devices for stopped vehicles.** Except as provided in paragraph (g) of this section, one of the following options must be used:

(1) Three bidirectional emergency reflective triangles that conform to the requirements of Federal Motor Vehicle Safety Standard No. 125, §571.125 of this title; or

(2) At least 6 fusees or 3 liquid-burning flares. The vehicle must have as many additional fusees or liquid-burning flares as are necessary to satisfy the requirements of §392.22.

(3) Other warning devices may be used in addition to, but not in lieu of, the required warning devices, provided those warning devices do not decrease the effectiveness of the required warning devices.

(g) **Restrictions on the use of flame-producing devices.** Liquid-burning flares, fusees, oil lanterns, or any signal produced by a flame shall not be carried on any commercial motor vehicle transporting Division 1.1, 1.2, 1.3 (explosives) hazardous materials; any cargo tank motor vehicle used for the transportation of Division 2.1 (flammable gas) or Class 3 (flammable liquid) hazardous materials whether loaded or empty; or any commercial motor vehicle using compressed gas as a motor fuel.

(h)–(i) [Reserved]

(j) **Requirements for fusees and liquid-burning flares.** Each fusee shall be capable of burning for 30 minutes, and each liquid-burning flare shall contain enough fuel to burn continuously for at least 60 minutes. Fusees and liquid-burning flares shall conform to the requirements of Underwriters Laboratories, Inc., UL No. 912, Highway Emergency Signals, Fourth Edition, July 30, 1979, (with an amendment dated November 9, 1981). (See §393.7 for information on the incorporation by reference and availability of this document.) Each fusee and liquid-burning flare shall be marked with the UL symbol in accordance with the requirements of UL 912.

(k) **Requirements for red flags.** Red flags shall be not less than 12 inches square, with standards adequate to maintain the flags in an upright position.

Subpart I—Protection against shifting and falling cargo

§393.100 Which types of commercial motor vehicles are subject to the cargo securement standards of this subpart, and what general requirements apply?

(a) **Applicability.** The rules in this subpart are applicable to trucks, truck tractors, semitrailers, full trailers, and pole trailers.

(b) **Prevention against loss of load.** Each commercial motor vehicle must, when transporting cargo on public roads, be loaded and equipped, and the cargo secured, in accordance with this subpart to prevent the cargo from leaking, spilling, blowing or falling from the motor vehicle.

(c) **Prevention against shifting of load.** Cargo must be contained, immobilized or secured in accordance with this subpart to prevent shifting upon or within the vehicle to such an extent that the vehicle's stability or maneuverability is adversely affected.

§393.102 What are the minimum performance criteria for cargo securement devices and systems?

(a) **Performance criteria—(1) Breaking Strength.** Tiedown assemblies (including chains, wire rope, steel strapping, synthetic webbing, and cordage) and other attachment or fastening devices used to secure articles of cargo to, or in, commercial motor vehicles must be designed, installed, and maintained to ensure that the maximum forces acting on the devices or systems do not exceed the manufacturer's breaking strength rating under the following conditions, applied separately:

- (i) 0.8 g deceleration in the forward direction;
- (ii) 0.5 g acceleration in the rearward direction; and
- (iii) 0.5 g acceleration in a lateral direction.

(2) **Working Load Limit.** Tiedown assemblies (including chains, wire rope, steel strapping, synthetic webbing, and cordage) and other attachment or fastening devices used to secure articles of cargo to, or in, commercial motor vehicles must be designed, installed, and maintained to ensure that the forces acting on the devices or systems do not exceed the working load limit for the devices under the following conditions, applied separately:

- (i) 0.435 g deceleration in the forward direction;
- (ii) 0.5 g acceleration in the rearward direction; and
- (iii) 0.25 g acceleration in a lateral direction.

(b) **Performance criteria for devices to prevent vertical movement of loads that are not contained within the structure of the vehicle.** Securement systems must provide a downward force equivalent to at least 20 percent of the weight of the article of cargo if the article is not fully contained within the structure of the vehicle. If the article is fully contained within the structure of the vehicle, it may be secured in accordance with §393.106(b).

(c) **Equivalent means of securement.** The means of securing articles of cargo are considered to meet the performance requirements of this section if the cargo is:

Regulations

(1) Immobilized, such so that it cannot shift or tip to the extent that the vehicle's stability or maneuverability is adversely affected; or

(2) Transported in a sided vehicle that has walls of adequate strength, such that each article of cargo within the vehicle is in contact with, or sufficiently close to a wall or other articles, so that it cannot shift or tip to the extent that the vehicle's stability or maneuverability is adversely affected; or

(3) Secured in accordance with the applicable requirements of §§393.104 through 393.136.

§393.104 What standards must cargo securement devices and systems meet in order to satisfy the requirements of this subpart?

(a) **General.** All devices and systems used to secure cargo to or within a vehicle must be capable of meeting the requirements of §393.102.

(b) **Prohibition on the use of damaged securement devices.** All tiedowns, cargo securement systems, parts and components used to secure cargo must be in proper working order when used to perform that function with no damaged or weakened components, such as, but not limited to, cracks or cuts that will adversely affect their

performance for cargo securement purposes, including reducing the working load limit.

(c) **Vehicle structures and anchor points.** Vehicle structures, floors, walls, decks, tiedown anchor points, headerboards, bulkheads, stakes, posts, and associated mounting pockets used to contain or secure articles of cargo must be strong enough to meet the performance criteria of §393.102, with no damaged or weakened components, such as, but not limited to, cracks or cuts that will adversely affect their performance for cargo securement purposes, including reducing the working load limit.

(d) **Material for dunnage, chocks, cradles, shoring bars, blocking and bracing.** Material used as dunnage or dunnage bags, chocks, cradles, shoring bars, or used for blocking and bracing, must not have damage or defects which would compromise the effectiveness of the securement system.

(e) **Manufacturing standards for tiedown assemblies.** Tie-down assemblies (including chains, wire rope, steel strapping, synthetic webbing, and cordage) and other attachment or fastening devices used to secure articles of cargo to, or in, commercial motor vehicles must conform to the following applicable standards:

An assembly component of...	Must conform to...
(1) Steel strapping ^{1, 2}	Standard Specification for Strapping, Flat Steel and Seals, American Society for Testing and Materials (ASTM) D3953-97, February 1998. ⁴
(2) Chain	National Association of Chain Manufacturers' Welded Steel Chain Specifications, dated September 28, 2005. ⁴
(3) Webbing	Web Sling and Tiedown Association's Recommended Standard Specification for Synthetic Web Tiedowns, WSTDA-T1, 1998. ⁴
(4) Wire rope ³	Wire Rope Technical Board's Wire Rope Users Manual, 2nd Edition, November 1985. ⁴
(5) Cordage	Cordage Institute rope standard: (i) PETRS-2, Polyester Fiber Rope, three-Strand and eight-Strand Constructions, January 1993; ⁴ (ii) PPRS-2, Polypropylene Fiber Rope, three-Strand and eight-Strand Constructions, August 1992; ⁴ (iii) CRS-1, Polyester/Polypropylene Composite Rope Specifications, three-Strand and eight-Strand Standard Construction, May 1979; ⁴ (iv) NRS-1, Nylon Rope Specifications, three-Strand and eight-Strand Standard Construction, May 1979; ⁴ and (v) C-1, Double Braided Nylon Rope Specifications DBN, January 1984. ⁴

¹ Steel strapping not marked by the manufacturer with a working load limit will be considered to have a working load limit equal to one-fourth of the breaking strength listed in ASTM D3953-97.

² Steel strapping 25.4 mm (1 inch) or wider must have at least two pairs of crimps in each seal and, when an end-over-end lap joint is formed, must be sealed with at least two seals.

³ Wire rope which is not marked by the manufacturer with a working load limit shall be considered to have a working load limit equal to one-fourth of the nominal strength listed in the manual.

⁴ See §393.7 for information on the incorporation by reference and availability of this document.

(f) **Use of tiedowns.** (1) Tiedowns and securing devices must not contain knots.

(2) If a tiedown is repaired, it must be repaired in accordance with the applicable standards in paragraph (e) of this section, or the manufacturer's instructions.

(3) Each tiedown must be attached and secured in a manner that prevents it from becoming loose, unfastening, opening or releasing while the vehicle is in transit.

(4) Edge protection must be used whenever a tiedown would be subject to abrasion or cutting at the point where it touches an article of cargo. The edge protection must resist abrasion, cutting and crushing.

§393.106 What are the general requirements for securing articles of cargo?

(a) **Applicability.** The rules in this section are applicable to the transportation of all types of articles of cargo, except commodities in bulk that lack structure or fixed shape (e.g., liquids, gases, grain, liquid concrete, sand, gravel, aggregates) and are transported in a tank, hopper, box, or similar device that forms part of the structure of a commercial motor vehicle. The rules in this section apply to the cargo types covered by the commodity-specific rules of §393.116 through §393.136. The commodity-specific rules take precedence over the general

Vehicle Maintenance Pro

requirements of this section when additional requirements are given for a commodity listed in those sections.

(b) **General.** Cargo must be firmly immobilized or secured on or within a vehicle by structures of adequate strength, dunnage or dunnage bags, shoring bars, tiedowns or a combination of these.

(c) **Cargo placement and restraint.** (1) Articles of cargo that are likely to roll must be restrained by chocks, wedges, a cradle or other equivalent means to prevent rolling. The means of preventing rolling must not be capable of becoming unintentionally unfastened or loose while the vehicle is in transit.

(2) Articles or cargo placed beside each other and secured by transverse tiedowns must either:

- (i) Be placed in direct contact with each other, or
- (ii) Be prevented from shifting towards each other while in transit.

(d) **Aggregate working load limit for tiedowns.** The aggregate working load limit of tiedowns used to secure an article or group of articles against movement must be at least one-half times the weight of the article or group of articles. The aggregate working load limit is the sum of:

(1) One-half the working load limit of each tiedown that goes from an anchor point on the vehicle to an anchor point on an article of cargo;

(2) One-half the working load limit of each tiedown that is attached to an anchor point on the vehicle, passes through, over, or around the article of cargo, and is then attached to an anchor point on the same side of the vehicle.

(3) The working load limit for each tiedown that goes from an anchor point on the vehicle, through, over, or around the article of cargo, and then attaches to another anchor point on the other side of the vehicle.

§393.108 How is the working load limit of a tiedown, or the load restraining value of a friction mat, determined?

(a) The working load limit (WLL) of a tiedown, associated connector or attachment mechanism is the lowest working load limit of any of its components (including tensioner), or the working load limit of the anchor points to which it is attached, whichever is less.

(b) The working load limits of tiedowns may be determined by using either the tiedown manufacturer's markings or by using the tables in this section. The working load limits listed in the tables are to be used when the tiedown material is not marked by the manufacturer with the working load limit. Tiedown materials which are marked by the manufacturer with working load limits that differ from the tables, shall be considered to have a working load limit equal to the value for which they are marked.

(c) Synthetic cordage (e.g., nylon, polypropylene, polyester) which is not marked or labeled to enable identification of its composition or working load limit shall be considered to have a working load limit equal to that for polypropylene fiber rope.

(d) Welded steel chain which is not marked or labeled to enable identification of its grade or working load limit

shall be considered to have a working load limit equal to that for grade 30 proof coil chain.

(e)(1) Wire rope which is not marked by the manufacturer with a working load limit shall be considered to have a working load limit equal to one-fourth of the nominal strength listed in the Wire Rope Users Manual.

(2) Wire which is not marked or labeled to enable identification of its construction type shall be considered to have a working load limit equal to that for 6 x 37, fiber core wire rope.

(f) Manila rope which is not marked by the manufacturer with a working load limit shall be considered to have a working load limit based on its diameter as provided in the tables of working load limits.

(g) Friction mats which are not marked or rated by the manufacturer shall be considered to provide resistance to horizontal movement equal to 50 percent of the weight placed on the mat.

TABLES TO §393.108 [WORKING LOAD LIMITS (WLL), CHAIN]

Size mm (inches)	WLL in kg (pounds)				
	Grade 30 proof coil	Grade 43 high test	Grade 70 transport	Grade 80 alloy	Grade 100 alloy
1. 7 (1/4)	580 (1,300)	1,180 (2,600)	1,430 (3,150)	1,570 (3,500)	1,950 (4,300)

§393.110 What else do I have to do to determine the minimum number of tiedowns?

(a) When tiedowns are used as part of a cargo securement system, the minimum number of tiedowns required to secure an article or group of articles against movement depends on the length of the article(s) being secured, and the requirements of paragraphs (b) and (c) of this section. These requirements are in addition to the rules under §393.106.

(b) When an article is not blocked or positioned to prevent movement in the forward direction by a headerboard, bulkhead, other cargo that is positioned to prevent movement, or other appropriate blocking devices, it must be secured by at least:

(1) One tiedown for articles 5 feet (1.52 meters) or less in length, and 1,100 pounds (500 kg) or less in weight;

(2) Two tiedowns if the article is:

(i) 5 feet (1.52 meters) or less in length and more than 1,100 pounds (500 kg) in weight; or

(ii) Longer than 5 feet (1.52 meters) but less than or equal to 10 feet (3.04 meters) in length, irrespective of the weight.

(3) Two tiedowns if the article is longer than 10 feet (3.04 meters), and one additional tiedown for every 10 feet (3.04 meters) of article length, or fraction thereof, beyond the first 10 feet (3.04 meters) of length.

(c) If an individual article is blocked, braced, or immobilized to prevent movement in the forward direction by a headerboard, bulkhead, other articles which are adequately secured or by an appropriate blocking or immobilization method, it must be secured by at least one tiedown for every 3.04 meters (10 feet) of article length, or fraction thereof.

(d) Special rule for special purpose vehicles. The rules in this section do not apply to a vehicle transporting one or more articles of cargo such as, but not limited to, machinery or fabricated structural items (e.g., steel or concrete beams, crane booms, girders, and trusses, etc.) which, because of their design, size, shape, or weight, must be fastened by special methods. However, any article of cargo carried on that vehicle must be securely and adequately fastened to the vehicle.

§393.112 Must a tiedown be adjustable?

Each tiedown, or its associated connectors, or its attachment mechanisms must be designed, constructed, and maintained so the driver of an in-transit commercial motor vehicle can tighten them. However, this requirement does not apply to the use of steel strapping.

Vehicle Maintenance Pro

§393.114 What are the requirements for front end structures used as part of a cargo securement system?

(a) **Applicability.** The rules in this section are applicable to commercial motor vehicles transporting articles of cargo that are in contact with the front end structure of the vehicle. The front end structure on these cargo-carrying vehicles must meet the performance requirements of this section.

(b) **Height and width.** (1) The front end structure must extend either to a height of 4 feet above the floor of the vehicle or to a height at which it blocks forward movement of any item or article of cargo being carried on the vehicle, whichever is lower.

(2) The front end structure must have a width which is at least equal to the width of the vehicle or which blocks forward movement of any article of cargo being transported on the vehicle, whichever is narrower.

(c) **Strength.** The front end structure must be capable of withstanding the following horizontal forward static load:

(1) For a front end structure less than 6 feet in height, a horizontal forward static load equal to one-half (0.5) of the weight of the articles of cargo being transported on the vehicle uniformly distributed over the entire portion of the front end structure that is within 4 feet above the vehicle's floor or that is at or below a height above the vehicle's floor at which it blocks forward movement of any article of the vehicle's cargo, whichever is less; or

(2) For a front end structure 6 feet in height or higher, a horizontal forward static load equal to four-tenths (0.4) of the weight of the articles of cargo being transported on the vehicle uniformly distributed over the entire front end structure.

(d) **Penetration resistance.** The front end structure must be designed, constructed, and maintained so that it is capable of resisting penetration by any article of cargo that contacts it when the vehicle decelerates at a rate of 20 feet per second, per second. The front end structure must have no aperture large enough to permit any article of cargo in contact with the structure to pass through it.

(e) **Substitute devices.** The requirements of this section may be met by the use of devices performing the same functions as a front end structure, if the devices are at least as strong as, and provide protection against shifting articles of cargo at least equal to, a front end structure which conforms to those requirements.

Specific Securement Requirements by Commodity Type

§393.116 What are the rules for securing logs?

(a) **Applicability.** The rules in this section are applicable to the transportation of logs with the following exceptions:

(1) Logs that are unitized by banding or other comparable means may be transported in accordance with the general cargo securement rules of §§393.100 through 393.114.

(2) Loads that consist of no more than four processed logs may be transported in accordance with the general cargo securement rules of §§393.100 through 393.114.

(3) Firewood, stumps, log debris and other such short logs must be transported in a vehicle or container enclosed on both sides, front, and rear and of adequate strength to contain them. Longer logs may also be so loaded.

(b) **Components of a securement system.** (1) Logs must be transported on a vehicle designed and built, or adapted, for the transportation of logs. Any such vehicle must be fitted with bunks, bolsters, stakes or standards, or other equivalent means, that cradle the logs and prevent them from rolling.

(2) All vehicle components involved in securement of logs must be designed and built to withstand all anticipated operational forces without failure, accidental release or permanent deformation. Stakes or standards that are not permanently attached to the vehicle must be secured in a manner that prevents unintentional separation from the vehicle in transit.

(3) Tiedowns must be used in combination with the stabilization provided by bunks, stakes, and bolsters to secure the load unless the logs:

(i) are transported in a crib-type log trailer (as defined in 49 CFR 393.5), and

(ii) are loaded in compliance with paragraphs (b)(2) and (c) of this section.

(4) The aggregate working load limit for tiedowns used to secure a stack of logs on a frame vehicle, or a flatbed vehicle equipped with bunks, bolsters, or stakes must be at least one-sixth the weight of the stack of logs.

(c) **Use of securement system.** (1) Logs must be solidly packed, and the outer bottom logs must be in contact with and resting solidly against the bunks, bolsters, stakes or standards.

(2) Each outside log on the side of a stack of logs must touch at least two stakes, bunks, bolsters, or standards. If one end does not actually touch a stake, it must rest on other logs in a stable manner and must extend beyond the stake, bunk, bolster or standard.

(3) The center of the highest outside log on each side or end must be below the top of each stake, bunk or standard.

(4) Each log that is not held in place by contact with other logs or the stakes, bunks, or standards must be held in place by a tie-down. Additional tiedowns or securement devices must be used when the condition of the wood results in such low friction between logs that they are likely to slip upon each other.

(d) **Securement of shortwood logs loaded crosswise on frame, rail and flatbed vehicles.** In addition to the requirements of paragraphs (b) and (c) of this section, each stack of logs loaded crosswise must meet the following rules:

(1) In no case may the end of a log in the lower tier extend more than one-third of the log's total length beyond the nearest supporting structure on the vehicle.

Regulations

(2) When only one stack of shortwood is loaded crosswise, it must be secured with at least two tiedowns. The tiedowns must attach to the vehicle frame at the front and rear of the load, and must cross the load in this direction.

(3) When two tiedowns are used, they must be positioned at approximately one-third and two-thirds of the length of the logs.

(4) A vehicle that is more than 10 meters (33 feet) long must be equipped with center stakes, or comparable devices, to divide it into sections approximately equal in length. Where a vehicle is so divided, each tiedown must secure the highest log on each side of the center stake, and must be fastened below these logs. It may be fixed at each end and tensioned from the middle, or fixed in the middle and tensioned from each end, or it may pass through a pulley or equivalent device in the middle and be tensioned from one end.

(5) Any structure or stake that is subjected to an upward force when the tiedowns are tensioned must be anchored to resist that force.

(6) If two stacks of shortwood are loaded side-by-side, in addition to meeting the requirements of paragraphs (d)(1) through (d)(5) of this section, they must be loaded so that:

- (i) There is no space between the two stacks of logs;
- (ii) The outside of each stack is raised at least 2.5 cm (1 in) within 10 cm (4 in) of the end of the logs or the side of the vehicle;
- (iii) The highest log is no more than 2.44 m (8 ft) above the deck; and
- (iv) At least one tiedown is used lengthwise across each stack of logs.

(e) **Securement of logs loaded lengthwise on flatbed and frame vehicles.** (1) **Shortwood.** In addition to meeting the requirements of paragraphs (b) and (c) of this section, each stack of shortwood loaded lengthwise on a frame vehicle or on a flatbed must be cradled in a bunk unit or contained by stakes and

- (i) Secured to the vehicle by at least two tiedowns, or
- (ii) If all the logs in any stack are blocked in the front by a front-end structure strong enough to restrain the load, or by another stack of logs, and blocked in the rear by another stack of logs or vehicle end structure, the stack may be secured with one tiedown. If one tiedown is used, it must be positioned about midway between the stakes, or

(iii) Be bound by at least two tiedown-type devices such as wire rope, used as wrappers that encircle the entire load at locations along the load that provide effective securement. If wrappers are being used to bundle the logs together, the wrappers are not required to be attached to the vehicle.

(2) **Longwood.** Longwood must be cradled in two or more bunks and must either:

- (i) Be secured to the vehicle by at least two tiedowns at locations that provide effective securement, or
- (ii) Be bound by at least two tiedown-type devices, such as wire rope, used as wrappers that encircle the entire load at locations along the load that provide effective

securement. If a wrapper(s) is being used to bundle the logs together, the wrapper is not required to be attached to the vehicle.

(f) **Securement of logs transported on pole trailers.** (1) The load must be secured by at least one tiedown at each bunk, or alternatively, by at least two tiedowns used as wrappers that encircle the entire load at locations along the load that provide effective securement.

(2) The front and rear wrappers must be at least 3.04 meters (10 feet) apart.

(3) Large diameter single and double log loads must be immobilized with chock blocks or other equivalent means to prevent shifting.

(4) Large diameter logs that rise above bunks must be secured to the underlying load with at least two additional wrappers.

§393.118 What are the rules for securing dressed lumber or similar building products?

(a) **Applicability.** The rules in this section apply to the transportation of bundles of dressed lumber, packaged lumber, building products such as plywood, gypsum board or other materials of similar shape. Lumber or building products which are not bundled or packaged must be treated as loose items and transported in accordance with §§393.100 through 393.114 of this subpart. For the purpose of this section, “bundle” refers to packages of lumber, building materials or similar products which are unitized for securement as a single article of cargo.

(b) **Positioning of bundles.** Bundles must be placed side by side in direct contact with each other, or a means must be provided to prevent bundles from shifting towards each other.

(c) **Securement of bundles transported using no more than one tier.** Bundles carried on one tier must be secured in accordance with the general provisions of §§393.100 through 393.114.

(d) **Securement of bundles transported using more than one tier.** Bundles carried in more than one tier must be either:

(1) Blocked against lateral movement by stakes on the sides of the vehicle and secured by tiedowns laid out over the top tier, as outlined in the general provisions of §§393.100 through 393.114; or

(2) Restrained from lateral movement by blocking or high friction devices between tiers and secured by tiedowns laid out over the top tier, as outlined in the general provisions of §§393.100 through 393.114; or

(3) Placed directly on top of other bundles or on spacers and secured in accordance with the following:

(i) The length of spacers between bundles must provide support to all pieces in the bottom row of the bundle.

(ii) The width of individual spacers must be equal to or greater than the height.

(iii) If spacers are comprised of layers of material, the layers must be unitized or fastened together in a manner which ensures that the spacer performs as a single piece of material.

Vehicle Maintenance Pro

(iv) The arrangement of the tiedowns for the bundles must be:

(A) Secured by tiedowns over the top tier of bundles, in accordance with the general provisions of §§393.100 through 393.114 with a minimum of two tiedowns for bundles longer than 1.52 meters (5 ft); and

(B) Secured by tiedowns as follows:

(1) If there are 3 tiers, the middle and top bundles must be secured by tiedowns in accordance with the general provisions of §§393.100 through 393.114; or

(2)(i) If there are more than 3 tiers, then one of the middle bundles and the top bundle must be secured by tiedown devices in accordance with the general provision of §§393.100 through 393.114, and the maximum height for the middle tier that must be secured may not exceed 6 feet above the deck of the trailer; or

(ii) Otherwise, the second tier from the bottom must be secured in accordance with the general provisions of §§393.100 through 393.114; or

(4) Secured by tiedowns over each tier of bundles, in accordance with §§393.100 through 393.114 using a minimum of two tiedowns over each of the top bundles longer than 1.52 meters (5 ft), in all circumstances; or

(e) When loaded in a sided vehicle or container of adequate strength, dressed lumber or similar building products may be secured in accordance with the general provisions of §§393.100 through 393.114.

§393.120 What are the rules for securing metal coils?

(a) **Applicability.** The rules in this section apply to the transportation of one or more metal coils which, individually or grouped together, weigh 2268 kg (5000 pounds) or more. Shipments of metal coils that weigh less than 2268 kg (5000 pounds) may be secured in accordance with the provisions of §§393.100 through 393.114.

(b) **Securement of coils transported with eyes vertical on a flatbed vehicle, in a sided vehicle or in an intermodal container with anchor points—**(1) An individual coil. Each coil must be secured by tiedowns arranged in a manner to prevent the coils from tipping in the forward, rearward, and lateral directions. The restraint system must include the following:

(i) At least one tiedown attached diagonally from the left side of the vehicle or intermodal container (near the forwardmost part of the coil), across the eye of the coil, to the right side of the vehicle or intermodal container (near the rearmost part of the coil);

(ii) At least one tiedown attached diagonally from the right side of the vehicle or intermodal container (near the forwardmost part of the coil), across the eye of the coil, to the left side of the vehicle or intermodal container (near the rearmost part of the coil);

(iii) At least one tiedown attached transversely over the eye of the coil; and

(iv) Either blocking and bracing, friction mats or tiedowns to prevent longitudinal movement in the forward direction.

(2) Coils grouped in rows. When coils are grouped and loaded side by side in a transverse or longitudinal row, then each row of coils must be secured by the following:

(i) At least one tiedown attached to the front of the row of coils, restraining against forward motion, and whenever practicable, making an angle no more than 45 degrees with the floor of the vehicle or intermodal container when viewed from the side of the vehicle or container;

(ii) At least one tiedown attached to the rear of the row of coils, restraining against rearward motion, and whenever practicable, making an angle no more than 45 degrees with the floor of the vehicle or intermodal container when viewed from the side of the vehicle or container;

(iii) At least one tiedown over the top of each coil or transverse row of coils, restraining against vertical motion. Tiedowns going over the top of a coil(s) must be as close as practicable to the eye of the coil and positioned to prevent the tiedown from slipping or becoming unintentionally unfastened while the vehicle is in transit; and

(iv) Tiedowns must be arranged to prevent shifting or tipping in the forward, rearward and lateral directions.

(c) **Securement of coils transported with eyes crosswise on a flatbed vehicle, in a sided vehicle or in an intermodal container with anchor points—**

(1) An individual coil. Each coil must be secured by the following:

(i) A means (e.g., timbers, chocks or wedges, a cradle, etc.) to prevent the coil from rolling. The means of preventing rolling must support the coil off the deck, and must not be capable of becoming unintentionally unfastened or loose while the vehicle is in transit. If timbers, chocks or wedges are used, they must be held in place by coil bunks or similar devices to prevent them from coming loose. The use of nailed blocking or cleats as the sole means to secure timbers, chocks or wedges, or a nailed wood cradle, is prohibited;

(ii) At least one tiedown through its eye, restricting against forward motion, and whenever practicable, making an angle no more than 45 degrees with the floor of the vehicle or intermodal container when viewed from the side of the vehicle or container; and

(iii) At least one tiedown through its eye, restricting against rearward motion, and whenever practicable, making an angle no more than 45 degrees with the floor of the vehicle or intermodal container when viewed from the side of the vehicle or container.

(2) Prohibition on crossing of tiedowns when coils are transported with eyes crosswise. Attaching tiedowns diagonally through the eye of a coil to form an X-pattern when viewed from above the vehicle is prohibited.

(d) **Securement of coils transported with eyes lengthwise on a flatbed vehicle, in a sided vehicle or in an intermodal container with anchor points—**

(1) An individual coil-option 1. Each coil must be secured by:

(i) A means (e.g., timbers, chocks or wedges, a cradle, etc.) to prevent the coil from rolling. The means of preventing rolling must support the coil off the deck, and must not be capable of becoming unintentionally unfastened or loose while the vehicle is in transit. If timbers, chocks or wedges are used, they must be held in place by

Regulations

coil bunks or similar devices to prevent them from coming loose. The use of nailed blocking or cleats as the sole means to secure timbers, chocks or wedges, or a nailed wood cradle, is prohibited;

(ii) At least one tiedown attached diagonally through its eye from the left side of the vehicle or intermodal container (near the forward-most part of the coil), to the right side of the vehicle or intermodal container (near the rearmost part of the coil), making an angle no more than 45 degrees, whenever practicable, with the floor of the vehicle or intermodal container when viewed from the side of the vehicle or container;

(iii) At least one tiedown attached diagonally through its eye, from the right side of the vehicle or intermodal container (near the forward-most part of the coil), to the left side of the vehicle or intermodal container (near the rearmost part of the coil), making an angle no more than 45 degrees, whenever practicable, with the floor of the vehicle or intermodal container when viewed from the side of the vehicle or container;

(iv) At least one tiedown attached transversely over the top of the coil; and

(v) Either blocking or friction mats to prevent longitudinal movement.

(2) An individual coil-option 2. Each coil must be secured by:

(i) A means (e.g., timbers, chocks or wedges, a cradle, etc.) to prevent the coil from rolling. The means of preventing rolling must support the coil off the deck, and must not be capable of becoming unintentionally unfastened or loose while the vehicle is in transit. If timbers, chocks or wedges are used, they must be held in place by coil bunks or similar devices to prevent them from coming loose. The use of nailed blocking or cleats as the sole means to secure timbers, chocks or wedges, or a nailed wood cradle, is prohibited;

(ii) At least one tiedown attached straight through its eye from the left side of the vehicle or intermodal container (near the forward-most part of the coil), to the left side of the vehicle or intermodal container (near the rearmost part of the coil), and, whenever practicable, making an angle no more than 45 degrees with the floor of the vehicle or intermodal container when viewed from the side of the vehicle or container;

(iii) At least one tiedown attached straight through its eye, from the right side of the vehicle or intermodal container (near the forward-most part of the coil), to the right side of the vehicle or intermodal container (near the rearmost part of the coil), and whenever practicable, making an angle no more than 45 degrees with the floor of the vehicle or intermodal container when viewed from the side of the vehicle or container;

(iv) At least one tiedown attached transversely over the top of the coil; and

(v) Either blocking or friction mats to prevent longitudinal movement.

(3) An individual coil-option 3. Each coil must be secured by:

(i) A means (e.g., timbers, chocks or wedges, a cradle, etc.) to prevent the coil from rolling. The means of preventing rolling must support the coil off the deck, and

must not be capable of becoming unintentionally unfastened or loose while the vehicle is in transit. If timbers, chocks or wedges are used, they must be held in place by coil bunks or similar devices to prevent them from coming loose. The use of nailed blocking or cleats as the sole means to secure timbers, chocks or wedges, or a nailed wood cradle, is prohibited;

(ii) At least one tiedown over the top of the coil, located near the forward-most part of the coil;

(iii) At least one tiedown over the top of the coil located near the rearmost part of the coil; and

(iv) Either blocking or friction mats to prevent longitudinal movement.

(4) Rows of coils. Each transverse row of coils having approximately equal outside diameters must be secured with:

(i) A means (e.g., timbers, chocks or wedges, a cradle, etc.) to prevent each coil in the row of coils from rolling. The means of preventing rolling must support each coil off the deck, and must not be capable of becoming unintentionally unfastened or loose while the vehicle is in transit. If timbers, chocks or wedges are used, they must be held in place by coil bunks or similar devices to prevent them from coming loose. The use of nailed blocking or cleats as the sole means to secure timbers, chocks or wedges, or a nailed wood cradle, is prohibited;

(ii) At least one tiedown over the top of each coil or transverse row, located near the forward-most part of the coil;

(iii) At least one tiedown over the top of each coil or transverse row, located near the rearmost part of the coil; and

(iv) Either blocking, bracing or friction mats to prevent longitudinal movement.

(e) Securement of coils transported in a sided vehicle without anchor points or an intermodal container without anchor points. Metal coils transported in a vehicle with sides without anchor points or an intermodal container without anchor points must be loaded in a manner to prevent shifting and tipping. The coils may also be secured using a system of blocking and bracing, friction mats, tiedowns, or a combination of these to prevent any horizontal movement and tipping.

§393.122 What are the rules for securing paper rolls?

(a) **Applicability.** The rules in this section apply to shipments of paper rolls which, individually or together, weigh 2268 kg (5000 lb) or more. Shipments of paper rolls that weigh less than 2268 kg (5000 lb), and paper rolls that are unitized on a pallet, may either be secured in accordance with the rules in this section or the requirements of §§393.100 through 393.114.

(b) **Securement of paper rolls transported with eyes vertical in a sided vehicle.** (1) Paper rolls must be placed tightly against the walls of the vehicle, other paper rolls, or other cargo, to prevent movement during transit.

(2) If there are not enough paper rolls in the shipment to reach the walls of the vehicle, lateral movement must be prevented by filling the void, blocking, bracing,

Vehicle Maintenance Pro

tiedowns or friction mats. The paper rolls may also be banded together.

(3) When any void behind a group of paper rolls, including that at the rear of the vehicle, exceeds the diameter of the paper rolls, rearward movement must be prevented by friction mats, blocking, bracing, tiedowns, or banding to other rolls.

(4)(i) If a paper roll is not prevented from tipping or falling sideways or rearwards by vehicle structure or other cargo, and its width is more than 2 times its diameter, it must be prevented from tipping or falling by banding it to other rolls, bracing, or tiedowns.

(ii) If the forwardmost roll(s) in a group of paper rolls has a width greater than 1.75 times its diameter and it is not prevented from tipping or falling forwards by vehicle structure or other cargo, then it must be prevented from tipping or falling forwards by banding it to other rolls, bracing, or tiedowns.

(iii) If the forwardmost roll(s) in a group of paper rolls has a width equal to or less than 1.75 times its diameter, and it is restrained against forward movement by friction mat(s) alone, then banding, bracing, or tiedowns are not required to prevent tipping or falling forwards.

(iv) If a paper roll or the forwardmost roll in a group of paper rolls has a width greater than 1.25 times its diameter, and it is not prevented from tipping or falling forwards by vehicle structure or other cargo, and it is not restrained against forward movement by friction mat(s) alone, then it must be prevented from tipping or falling by banding it to other rolls, bracing or tiedowns.

(5) If paper rolls are banded together, the rolls must be placed tightly against each other to form a stable group. The bands must be applied tightly, and must be secured so that they cannot fall off the rolls or to the deck.

(6) A friction mat used to provide the principal securement for a paper roll must protrude from beneath the roll in the direction in which it is providing that securement.

(c) Securement of split loads of paper rolls transported with eyes vertical in a sided vehicle. (1) If a paper roll in a split load is not prevented from forward movement by vehicle structure or other cargo, it must be prevented from forward movement by filling the open space, or by blocking, bracing, tiedowns, friction mats, or some combination of these.

(2) A friction mat used to provide the principal securement for a paper roll must protrude from beneath the roll in the direction in which it is providing that securement.

(d) Securement of stacked loads of paper rolls transported with eyes vertical in a sided vehicle. (1) Paper rolls must not be loaded on a layer of paper rolls beneath unless the lower layer extends to the front of the vehicle.

(2) Paper rolls in the second and subsequent layers must be prevented from forward, rearward or lateral movement by means as allowed for the bottom layer, or by use of a blocking roll from a lower layer.

(3) The blocking roll must be at least 38 mm (1.5 in) taller than other rolls, or must be raised at least 38 mm (1.5 in) using dunnage.

(4) A roll in the rearmost row of any layer raised using dunnage may not be secured by friction mats alone.

(e) Securement of paper rolls transported with eyes crosswise in a sided vehicle. (1) The paper rolls must be prevented from rolling or shifting longitudinally by contact with vehicle structure or other cargo, by chocks, wedges or blocking and bracing of adequate size, or by tiedowns.

(2) Chocks, wedges or blocking must be held securely in place by some means in addition to friction, so they cannot become unintentionally unfastened or loose while the vehicle is in transit.

(3) The rearmost roll must not be secured using the rear doors of the vehicle or intermodal container, or by blocking held in place by those doors.

(4) If there is more than a total of 203 mm (8 in) of space between the ends of a paper roll, or a row of rolls, and the walls of the vehicle, void fillers, blocking, bracing, friction mats, or tie-downs must be used to prevent the roll from shifting towards either wall.

(f) Securement of stacked loads of paper rolls transported with eyes crosswise in a sided vehicle. (1) Rolls must not be loaded in a second layer unless the bottom layer extends to the front of the vehicle.

(2) Rolls must not be loaded in a third or higher layer unless all wells in the layer beneath are filled.

(3) The foremost roll in each upper layer, or any roll with an empty well in front of it, must be secured against forward movement by:

(i) Banding it to other rolls, or

(ii) Blocking against an adequately secured eye-vertical blocking roll resting on the floor of the vehicle which is at least 1.5 times taller than the diameter of the roll being blocked, or

(iii) Placing it in a well formed by two rolls on the lower row whose diameter is equal to or greater than that of the roll on the upper row.

(4) The rearmost roll in each upper layer must be secured by banding it to other rolls if it is located in either of the last two wells formed by the rearmost rolls in the layer below.

(5) Rolls must be secured against lateral movement by the same means allowed for the bottom layer when there is more than a total of 203 mm (8 in) of space between the ends of a paper roll, or a row of rolls, and the walls of the vehicle.

(g) Securement of paper rolls transported with the eyes lengthwise in a sided vehicle.

(1) Each roll must be prevented from forward movement by contact with vehicle structure, other cargo, blocking or tie-downs.

(2) Each roll must be prevented from rearward movement by contact with other cargo, blocking, friction mats or tiedowns.

(3) The paper rolls must be prevented from rolling or shifting laterally by contact with the wall of the vehicle or other cargo, or by chocks, wedges or blocking of adequate size.

(4) Chocks, wedges or blocking must be held securely in place by some means in addition to friction, so they

Regulations

cannot become unintentionally unfastened or loose while the vehicle is in transit.

(h) **Securement of stacked loads of paper rolls transported with the eyes lengthwise in a sided vehicle.** (1) Rolls must not be loaded in a higher layer if another roll will fit in the layer beneath.

(2) An upper layer must be formed by placing paper rolls in the wells formed by the rolls beneath.

(3) A roll in an upper layer must be secured against forward and rearward movement by any of the means allowed for the bottom layer, by use of a blocking roll, or by banding to other rolls.

(i) **Securement of paper rolls transported on a flatbed vehicle or in a curtain-sided vehicle—** (1) Paper rolls with eyes vertical or with eyes lengthwise.

(i) The paper rolls must be loaded and secured as described for a sided vehicle, and the entire load must be secured by tie-downs in accordance with the requirements of §§393.100 through 393.114.

(ii) Stacked loads of paper rolls with eyes vertical are prohibited.

(2) Paper rolls with eyes crosswise. (i) The paper rolls must be prevented from rolling or shifting longitudinally by contact with vehicle structure or other cargo, by chocks, wedges or blocking and bracing of adequate size, or by tiedowns.

(ii) Chocks, wedges or blocking must be held securely in place by some means in addition to friction so that they cannot become unintentionally unfastened or loose while the vehicle is in transit.

(iii) Tiedowns must be used in accordance with the requirements of §§393.100 through 393.114 to prevent lateral movement.

§393.124 What are the rules for securing concrete pipe?

(a) **Applicability.** (1) The rules in this section apply to the transportation of concrete pipe on flatbed trailers and vehicles, and lowboy trailers.

(2) Concrete pipe bundled tightly together into a single rigid article that has no tendency to roll, and concrete pipe loaded in a sided vehicle or container must be secured in accordance with the provisions of §§393.100 through 393.114.

(b) **General specifications for tiedowns.** (1) The aggregate working load limit of all tiedowns on any group of pipes must not be less than half the total weight of all the pipes in the group.

(2) A transverse tiedown through a pipe on an upper tier or over longitudinal tiedowns is considered to secure all those pipes beneath on which that tiedown causes pressure.

(c) **Blocking.** (1) Blocking may be one or more pieces placed symmetrically about the center of a pipe.

(2) One piece must extend at least half the distance from the center to each end of the pipe, and two pieces must be placed on the opposite side, one at each end of the pipe.

(3) Blocking must be placed firmly against the pipe, and must be secured to prevent it moving out from under the pipe.

(4) Timber blocking must have minimum dimensions of at least 10 x 15 cm (4 x 6 in).

(d) **Arranging the load—(1) Pipe of different diameter.** If pipe of more than one diameter are loaded on a vehicle, groups must be formed that consist of pipe of only one size, and each group must be separately secured.

(2) **Arranging a bottom tier.** The bottom tier must be arranged to cover the full length of the vehicle, or as a partial tier in one group or two groups.

(3) **Arranging an upper tier.** Pipe must be placed only in the wells formed by adjacent pipes in the tier beneath. A third or higher tier must not be started unless all wells in the tier beneath are filled.

(4) **Arranging the top tier.** The top tier must be arranged as a complete tier, a partial tier in one group, or a partial tier in two groups.

(5) **Arranging bell pipe.** (i) Bell pipe must be loaded on at least two longitudinal spacers of sufficient height to ensure that the bell is clear of the deck.

(ii) Bell pipe loaded in one tier must have the bells alternating on opposite sides of the vehicle.

(iii) The ends of consecutive pipe must be staggered, if possible, within the allowable width, otherwise they must be aligned.

(iv) Bell pipe loaded in more than one tier must have the bells of the bottom tier all on the same side of the vehicle.

(v) Pipe in every upper tier must be loaded with bells on the opposite side of the vehicle to the bells of the tier below.

(vi) If the second tier is not complete, pipe in the bottom tier which do not support a pipe above must have their bells alternating on opposite sides of the vehicle.

(e) **Securing pipe with an inside diameter up to 1,143 mm (45 in).** In addition to the requirements of paragraphs (b), (c) and (d) of this section, the following rules must be satisfied:

(1) **Stabilizing the bottom tier.** (i) The bottom tier must be immobilized longitudinally at each end by blocking, vehicle end structure, stakes, a locked pipe unloader, or other equivalent means.

(ii) Other pipe in the bottom tier may also be held in place by blocks and/or wedges; and

(iii) Every pipe in the bottom tier must also be held firmly in contact with the adjacent pipe by tiedowns through the front and rear pipes:

(A) At least one tiedown through the front pipe of the bottom tier must run aft at an angle not more than 45 degrees with the horizontal, whenever practicable.

(B) At least one tiedown through the rear pipe of the bottom tier must run forward at an angle not more than 45 degrees with the horizontal, whenever practicable.

(2) **Use of tiedowns.** (i) Each pipe may be secured individually with tiedowns through the pipe.

(ii) If each pipe is not secured individually with a tiedown, then:

Vehicle Maintenance Pro

(A) Either one ½-inch diameter chain or wire rope, or two ⅜-inch diameter chain or wire rope, must be placed longitudinally over the group of pipes;

(B) One transverse tiedown must be used for every 3.04 m (10 ft) of load length. The transverse tiedowns may be placed through a pipe, or over both longitudinal tiedowns between two pipes on the top tier;

(C) If the first pipe of a group in the top tier is not placed in the first well formed by pipes at the front of the tier beneath, it must be secured by an additional tiedown that runs rearward at an angle not more than 45 degrees to the horizontal, whenever practicable. This tiedown must pass either through the front pipe of the upper tier, or outside it and over both longitudinal tie-downs; and

(D) If the last pipe of a group in the top tier is not placed in the last well formed by pipes at the rear of the tier beneath, it must be secured by an additional tiedown that runs forward at an angle not more than 45 degrees to the horizontal, whenever practicable. This tiedown must pass either through the rear pipe of the upper tier or outside it and over both longitudinal tiedowns.

(f) **Securing large pipe, with an inside diameter over 1143 mm (45 in).** In addition to the requirements of paragraphs (b), (c) and (d) of this section, the following rules must be satisfied:

(1) The front pipe and the rear pipe must be immobilized by blocking, wedges, vehicle end structure, stakes, locked pipe unloader, or other equivalent means.

(2) Each pipe must be secured by tiedowns through the pipe:

(i) At least one tiedown through each pipe in the front half of the load, which includes the middle one if there is an odd number, and must run rearward at an angle not more than 45 degrees with the horizontal, whenever practicable;

(ii) At least one tiedown through each pipe in the rear half of the load, and must run forward at an angle not more than 45 degrees with the horizontal, whenever practicable, to hold each pipe firmly in contact with adjacent pipe; and

(iii) If the front or rear pipe is not also in contact with vehicle end structure, stakes, a locked pipe unloader, or other equivalent means, at least two tiedowns positioned as described in paragraphs (f)(2)(i) and (ii) of this section, must be used through that pipe.

(3) If only one pipe is transported, or if several pipes are transported without contact between other pipes, the requirements in this paragraph apply to each pipe as a single front and rear article.

§393.126 What are the rules for securing intermodal containers?

(a) **Applicability.** The rules in this section apply to the transportation of intermodal containers. Cargo contained within an intermodal container must be secured in accordance with the provisions of §§393.100 through 393.114 or, if applicable, the commodity specific rules of this part.

(b) **Securement of intermodal containers transported on container chassis vehicle(s).** (1) All lower corners of the intermodal container must be secured to

the container chassis with securement devices or integral locking devices that cannot unintentionally become unfastened while the vehicle is in transit.

(2) The securement devices must restrain the container from moving more than 1.27 cm (½ in) forward, more than 1.27 cm (½ in) aft, more than 1.27 cm (½ in) to the right, more than 1.27 cm (½ in) to the left, or more than 2.54 cm (1 in) vertically.

(3) The front and rear of the container must be secured independently.

(c) **Securement of loaded intermodal containers transported on vehicles other than container chassis vehicle(s).** (1) All lower corners of the intermodal container must rest upon the vehicle, or the corners must be supported by a structure capable of bearing the weight of the container and that support structure must be independently secured to the motor vehicle.

(2) Each container must be secured to the vehicle by:

(i) Chains, wire ropes or integral devices which are fixed to all lower corners; or

(ii) Crossed chains which are fixed to all upper corners; and,

(3) The front and rear of the container must be secured independently. Each chain, wire rope, or integral locking device must be attached to the container in a manner that prevents it from being unintentionally unfastened while the vehicle is in transit.

(d) **Securement of empty intermodal containers transported on vehicles other than container chassis vehicle(s).** Empty intermodal containers transported on vehicles other than container chassis vehicles do not have to have all lower corners of the intermodal container resting upon the vehicle, or have all lower corners supported by a structure capable of bearing the weight of the empty container, provided:

(1) The empty intermodal container is balanced and positioned on the vehicle in a manner such that the container is stable before the addition of tiedowns or other securement equipment; and,

(2) The amount of overhang for the empty container on the trailer does not exceed five feet on either the front or rear of the trailer;

(3) The empty intermodal container must not interfere with the vehicle's maneuverability; and,

(4) The empty intermodal container is secured to prevent lateral, longitudinal, or vertical shifting.

§393.128 What are the rules for securing automobiles, light trucks and vans?

(a) **Applicability.** The rules in this section apply to the transportation of automobiles, light trucks, and vans which individually weigh 4,536 kg. (10,000 lb) or less.

Regulations

Vehicles which individually are heavier than 4,536 kg (10,000 lb) must be secured in accordance with the provisions of §393.130 of this part.

(b) Securement of automobiles, light trucks, and vans.

(1) Automobiles, light trucks, and vans must be restrained at both the front and rear to prevent lateral, forward, rearward, and vertical movement using a minimum of two tiedowns.

(2) Tiedowns that are designed to be affixed to the structure of the automobile, light truck, or van must use the mounting points on those vehicles that have been specifically designed for that purpose.

(3) Tiedowns that are designed to fit over or around the wheels of an automobile, light truck, or van must provide restraint in the lateral, longitudinal and vertical directions.

(4) Edge protectors are not required for synthetic webbing at points where the webbing comes in contact with the tires.

§393.130 What are the rules for securing heavy vehicles, equipment and machinery?

(a) **Applicability.** The rules in this section apply to the transportation of heavy vehicles, equipment and machinery which operate on wheels or tracks, such as front end loaders, bulldozers, tractors, and power shovels and which individually weigh 4,536 kg (10,000 lb.) or more. Vehicles, equipment and machinery which is lighter than 4,536 kg (10,000 lb.) may also be secured in accordance with the provisions of this section, with §393.128, or in accordance with the provisions of §§393.100 through 393.114.

(b) Preparation of equipment being transported.

(1) Accessory equipment, such as hydraulic shovels, must be completely lowered and secured to the vehicle.

(2) Articulated vehicles shall be restrained in a manner that prevents articulation while in transit.

(c) **Securement of heavy vehicles, equipment or machinery with crawler tracks or wheels.** (1) In addition to the requirements of paragraph (b) of this section, heavy equipment or machinery with crawler tracks or wheels must be restrained against movement in the lateral, forward, rearward, and vertical direction using a minimum of four tiedowns.

(2) Each of the tiedowns must be affixed as close as practicable to the front and rear of the vehicle, or mounting points on the vehicle that have been specifically designed for that purpose.

§393.132 What are the rules for securing flattened or crushed vehicles?

(a) **Applicability.** The rules in this section apply to the transportation of vehicles such as automobiles, light trucks, and vans that have been flattened or crushed.

(b) **Prohibition on the use of synthetic webbing.** The use of synthetic webbing to secure flattened or crushed vehicles is prohibited except that such webbing may be used to connect wire rope or chain to anchor points on the commercial motor vehicle. However, the webbing (regardless of whether edge protection is used)

must not come into contact with the flattened or crushed cars.

(c) **Securement of flattened or crushed vehicles.** Flattened or crushed vehicles must be transported on vehicles which have:

(1) Containment walls or comparable means on four sides which extend to the full height of the load and which block against movement of the cargo in the forward, rearward and lateral directions; or

(2)(i) Containment walls or comparable means on three sides which extend to the full height of the load and which block against movement of the cargo in the direction for which there is a containment wall or comparable means, and

(ii) A minimum of two tiedowns are required per vehicle stack; or

(3)(i) Containment walls on two sides which extend to the full height of the load and which block against movement of the cargo in the forward and rearward directions, and

(ii) A minimum of three tiedowns are required per vehicle stack; or

(4) A minimum of four tiedowns per vehicle stack.

(5) In addition to the requirements of paragraphs (c)(2), (3), and (4), the following rules must be satisfied:

(i) Vehicles used to transport flattened or crushed vehicles must be equipped with a means to prevent liquids from leaking from the bottom of the vehicle, and loose parts from falling from the bottom and all four sides of the vehicle extending to the full height of the cargo.

(ii) The means used to contain loose parts may consist of structural walls, sides or sideboards, or suitable covering material, alone or in combinations.

(iii) The use of synthetic material for containment of loose parts is permitted.

§393.134 What are the rules for securing roll-on/roll-off or hook lift containers?

(a) **Applicability.** The rules in this section apply to the transportation of roll-on/roll-off or hook lift containers.

(b) **Securement of a roll-on/roll-off and hook lift container.** Each roll-on/roll-off and hook lift container carried on a vehicle which is not equipped with an integral securement system must be:

(1) Blocked against forward movement by the lifting device, stops, a combination of both or other suitable restraint mechanism;

(2) Secured to the front of the vehicle by the lifting device or other suitable restraint against lateral and vertical movement;

(3) Secured to the rear of the vehicle with at least one of the following mechanisms:

(i) One tiedown attached to both the vehicle chassis and the container chassis;

(ii) Two tiedowns installed lengthwise, each securing one side of the container to one of the vehicle's side rails; or

Vehicle Maintenance Pro

(iii) Two hooks, or an equivalent mechanism, securing both sides of the container to the vehicle chassis at least as effectively as the tiedowns in the two previous items.

(4) The mechanisms used to secure the rear end of a roll-on/roll off or hook lift container must be installed no more than two meters (6 ft 7 in) from the rear of the container.

(5) In the event that one or more of the front stops or lifting devices are missing, damaged or not compatible, additional manually installed tiedowns must be used to secure the container to the vehicle, providing the same level of securement as the missing, damaged or incompatible components.

§393.136 What are the rules for securing large boulders?

(a) **Applicability.** (1) The rules in this section are applicable to the transportation of any large piece of natural, irregularly shaped rock weighing in excess of 5,000 kg (11,000 lb.) or with a volume in excess of 2 cubic-meters on an open vehicle, or in a vehicle whose sides are not designed and rated to contain such cargo.

(2) Pieces of rock weighing more than 100 kg (220 lb.), but less than 5,000 kg (11,000 lb.) must be secured, either in accordance with this section, or in accordance with the provisions of §§393.100 through 393.114, including:

(i) Rock contained within a vehicle which is designed to carry such cargo; or

(ii) Secured individually by tiedowns, provided each piece can be stabilized and adequately secured.

(3) Rock which has been formed or cut to a shape and which provides a stable base for securement must also be secured, either in accordance with the provisions of this section, or in accordance with the provisions of §§393.100 through 393.114.

(b) **General requirements for the positioning of boulders on the vehicle.** (1) Each boulder must be placed with its flattest and/or largest side down.

(2) Each boulder must be supported on at least two pieces of hard wood blocking at least 10 cm x 10 cm (4 inches x 4 inches) side dimensions extending the full width of the boulder.

(3) Hardwood blocking pieces must be placed as symmetrically as possible under the boulder and should support at least three-fourths of the length of the boulder.

(4) If the flattest side of a boulder is rounded or partially rounded, so that the boulder may roll, it must be placed in a crib made of hardwood timber fixed to the deck of the vehicle so that the boulder rests on both the deck and the timber, with at least three well-separated points of contact that prevent its tendency to roll in any direction.

(5) If a boulder is tapered, the narrowest end must point towards the front of the vehicle.

(c) **General tiedown requirements.** (1) Only chain may be used as tiedowns to secure large boulders.

(2) Tiedowns which are in direct contact with the boulder should, where possible, be located in valleys or

notches across the top of the boulder, and must be arranged to prevent sliding across the rock surface.

(d) **Securement of a cubic shaped boulder.** In addition to the requirements of paragraphs (b) and (c) of this section, the following rules must be satisfied:

(1) Each boulder must be secured individually with at least two chain tiedowns placed transversely across the vehicle.

(2) The aggregate working load limit of the tiedowns must be at least half the weight of the boulder.

(3) The tiedowns must be placed as closely as possible to the wood blocking used to support the boulder.

(e) **Securement of a non-cubic shaped boulder-with a stable base.** In addition to the requirements of paragraphs (b) and (c) of this section, the following rules must be satisfied:

(1) The boulder must be secured individually with at least two chain tiedowns forming an "X" pattern over the boulder.

(2) The aggregate working load limit of the tiedowns must be at least half the weight of the boulder.

(3) The tiedowns must pass over the center of the boulder and must be attached to each other at the intersection by a shackle or other connecting device.

(f) **Securement of a non-cubic shaped boulder-with an unstable base.** In addition to the requirements of paragraphs (b) and (c) of this section, each boulder must be secured by a combination of chain tiedowns as follows:

(1) One chain must surround the top of the boulder (at a point between one-half and two-thirds of its height). The working load limit of the chain must be at least half the weight of the boulder.

(2) Four chains must be attached to the surrounding chain and the vehicle to form a blocking mechanism which prevents any horizontal movement. Each chain must have a working load limit of at least one-fourth the weight of the boulder. Whenever practicable, the angle of the chains must not exceed 45 degrees from the horizontal.

Subpart J—Frames, cab and body components, wheels, steering, and suspension systems

§393.201 Frames.

(a) The frame or chassis of each commercial motor vehicle shall not be cracked, loose, sagging or broken.

(b) Bolts or brackets securing the cab or the body of the vehicle to the frame must not be loose, broken, or missing.

(c) The frame rail flanges between the axles shall not be bent, cut or notched, except as specified by the manufacturer.

(d) Parts and accessories shall not be welded to the frame or chassis of a commercial motor vehicle except in accordance with the vehicle manufacturer's recommendations. Any welded repair of the frame must also be in accordance with the vehicle manufacturer's recommendations.

Regulations

(e) No holes shall be drilled in the top or bottom rail flanges, except as specified by the manufacturer.

§393.203 Cab and body components.

(a) The cab compartment doors or door parts used as an entrance or exit shall not be missing or broken. Doors shall not sag so that they cannot be properly opened or closed. No door shall be wired shut or otherwise secured in the closed position so that it cannot be readily opened. Exception: When the vehicle is loaded with pipe or bar stock that blocks the door and the cab has a roof exit.

(b) Bolts or brackets securing the cab or the body of the vehicle to the frame shall not be loose, broken, or missing.

(c) The hood must be securely fastened.

(d) All seats must be securely mounted.

(e) The front bumper must not be missing, loosely attached, or protruding beyond the confines of the vehicle so as to create a hazard.

§393.205 Wheels.

(a) Wheels and rims shall not be cracked or broken.

(b) Stud or bolt holes on the wheels shall not be elongated (out of round).

(c) Nuts or bolts shall not be missing or loose.

§393.207 Suspension systems.

(a) **Axles.** No axle positioning part shall be cracked, broken, loose or missing. All axles must be in proper alignment.

(b) **Adjustable axles.** Adjustable axle assemblies shall not have locking pins missing or disengaged.

(c) **Leaf springs.** No leaf spring shall be cracked, broken, or missing nor shifted out of position.

(d) **Coil springs.** No coil spring shall be cracked or broken.

(e) **Torsion bar.** No torsion bar or torsion bar suspension shall be cracked or broken.

(f) **Air Suspensions.** The air pressure regulator valve shall not allow air into the suspension system until at least 55 psi is in the braking system. The vehicle shall be level (not tilting to the left or right). Air leakage shall not be greater than 3 psi in a 5-minute time period when the vehicle's air pressure gauge shows normal operating pressure.

(g) **Air suspension exhaust controls.** The air suspension exhaust controls must not have the capability to exhaust air from the suspension system of one axle of a two-axle air suspension trailer unless the controls are either located on the trailer, or the power unit and trailer combination are not capable of traveling at a speed greater than 10 miles per hour while the air is exhausted from the suspension system. This paragraph shall not be construed to prohibit—

(1) Devices that could exhaust air from both axle systems simultaneously; or

(2) Lift axles on multi-axle units.

§393.209 Steering wheel systems.

(a) The steering wheel shall be secured and must not have any spokes cracked through or missing.

(b) **Steering wheel lash.** (1) The steering wheel lash shall not exceed the following parameters:

Steering wheel diameter	Manual steering system	Power steering system
406 mm or less (16 inches or less)	51 mm (2 inches)	108 mm (4 ¼ inches)
457 mm (18 inches)...	57 mm (2 ¼ inches)	121 mm (4 ¾ inches)
483 mm (19 inches)...	60 mm (2 ⅜ inches)	127 mm (5 inches)
508 mm (20 inches)...	64 mm (2 ½ inches)	133 mm (5 ¼ inches)
533 mm (21 inches)...	67 mm (2 ⅝ inches)	140 mm (5 ½ inches)
559 mm (22 inches)...	70 mm (2 ¾ inches)	146 mm (5 ¾ inches)

(2) For steering wheel diameters not listed in paragraph (b)(1) of this section the steering wheel lash shall not exceed 14 degrees angular rotation for manual steering systems, and 30 degrees angular rotation for power steering systems.

(c) **Steering column.** The steering column must be securely fastened.

(d) **Steering system.** Universal joints and ball-and-socket joints shall not be worn, faulty or repaired by welding. The steering gear box shall not have loose or missing mounting bolts or cracks in the gear box or mounting brackets. The pitman arm on the steering gear output shaft shall not be loose. Steering wheels shall turn freely through the limit of travel in both directions.

(e) **Power steering systems.** All components of the power system must be in operating condition. No parts shall be loose or broken. Belts shall not be frayed, cracked or slipping. The system shall not leak. The power steering system shall have sufficient fluid in the reservoir.

Regulations

§393.11 Lighting Devices and Reflectors

Question 1: What is the definition of “body” with respect to trucks and trailers?

Guidance: The FMCSRs do not include a definition of “body.” However, a truck or trailer body generally means the structure or fixture designed to contain, or support, the material or property to be transported on the vehicle.

Question 2: May retroreflective tape be used in place of side reflex reflectors?

Guidance: §393.26(b) cross references FMVSS 108 (49 CFR 571.108, S5.1.1.4) which allows reflective material to be used for side reflex reflectors under the conditions described below. Retro-reflective tape conforming to Federal specification L-S-300, “Sheeting and Tape, Reflective; Non-exposed Lens, Adhesive Backing,” September 7, 1965, may be used in place of side *reflex reflectors* if this material as used on the vehicle, meets the performance standards in either Table I or Table IA of Society of Automotive Engineers J594f, Reflex Reflectors, January 1977.

Question 3: §393.11, Footnote 5, requires that each converter dolly be equipped with turn signals at the rear if the converter dolly obscures the turn signals at the rear of the towing vehicle when towed singly by another vehicle. Are turn signals required on the rear of the converter dolly when the towing of the unladen dolly prevents other motorists from seeing only a portion of the lenses of the turn signals on the towing vehicle?

Guidance: Yes. Although a portion of the rear turn signal lenses on the towing vehicle may be visible to other drivers, the turn signal generally would not satisfy the visibility requirements of FMVSS No. 108 (49 CFR 571.108) if the converter dolly prevents other motorists from seeing the entire lens. The visibility requirements of FMVSS No. 108 help to ensure that other drivers can see the turn signal from a range of positions to the rear of the vehicle. Therefore, turn signals on the towing vehicle are considered to be obscured by the converter dolly if other motorists’ view of the lens is even partially blocked.

Question 4: Does a CMV equipped with amber tail lamps in addition to the red tail lamps required to designate the rear of a CMV meet the lighting requirements of §393.11?

Guidance: No. §393.11 requires that lighting devices on CMVs placed in operation after March 7, 1989, meet the requirements of FMVSS No. 108 in effect at the time of manufacture. The NHTSA has issued interpretations which indicate that the use of amber tail lamps impairs the effectiveness of the required lighting equipment and as such is prohibited by FMVSS No. 108 (S5.1.3). Since NHTSA does not allow vehicle manufacturers to install amber tail lamps, the FHWA has concluded that the use of amber tail lamps on vehicles placed in operation after March 7, 1989, is prohibited by §393.11.

In the case of vehicles placed in operation on or before March 7, 1989, §393.11 requires that vehicles meet *either* the lighting requirements of part 393 or FMVSS No. 108 in effect at the time of manufacture. Prior to the December 7, 1988, final rule on part 393 (53 FR 49397), amber tail lamps were prohibited by §393.25.

§393.25(e)(3) (in the October 1, 1988 edition of the Code of Federal Regulations) required all rear lamps, with certain exceptions, to be red. Since tail lamps were not included in the exceptions, the use of amber tail lamps was implicitly prohibited. Therefore, a vehicle placed in operation on or before March 7, 1989, must not be equipped with amber tail lamps because the use of such lamps meets *neither* the lighting requirements of part 393 *nor* FMVSS No. 108 in effect at the time of manufacture.

§393.17 Lamps and Reflectors-Combinations in Driveaway-Towaway Operation

Question 1: What are the lighting requirements when a tow truck is pulling a wrecked or disabled vehicle?

Guidance: A wrecker pulling a vehicle would be considered a driveaway-towaway operation and would have to be equipped with the lighting devices specified in §393.17 when operating in interstate commerce.

§393.24 Requirements for Head Lamps and Auxiliary Road Lighting Lamps

Question 1: Must additional lamps that are not required be operative if all required lamps are operative?

Guidance: No.

§393.25 Requirements for Lamps Other Than Head Lamps

Question 1: Are lighting devices on mobile homes/house trailers required to be permanently mounted?

Guidance: No. The movement of mobile homes/house trailers is considered to be a driveaway-towaway operation.

Question 2: Are there any special lighting requirements for large containers?

Guidance: No.

Question 3: What are the lighting requirements when a container assumes the structural requirements of a trailer?

Guidance: All relevant requirements of the regulations must be met by this container/trailer.

§393.28 Wiring to be Protected

Question 1: Does a frame channel of a CMV constitute a protective “sheath or tube” as specified in §393.28?

Guidance: No. To be acceptable, a sheath or tube must enclose the wires throughout their circumference. In the absence of a sheath or tube, the group of wires must be protected by nonconductive tape, braid, or other covering capable of withstanding severe abrasion.

§393.31 Overload Protective Devices

Question 1: Must all trailers be equipped with overload protective devices?

Guidance: No. Trailers do not need overload protective devices when protection of trailer circuits is provided on the towing vehicle. A circuit breaker is required only when the head lamp circuit is protected in common with one or more other circuits. A circuit breaker, if required, must be an automatic reset type.

§393.40 Required Brake Systems

Question 1: May a system such as “driveline brakes” be used as an emergency brake provided it complies with the requirements of §393.52?

Guidance: Yes. CMVs which were not subject to the emergency brake requirements of FMVSS Nos. 105 or 121 may use “drive line brakes” provided those vehicles meet the requirements of §393.52.

Regulations

§393.41 Parking Brake Systems

Question 1: May the “park” position of a CMV’s transmission be used as a parking brake to comply with the §393.41?

Guidance: No. The “park” position of the transmission is only a locking device used to lock the transmission.

Question 2: Does §393.41 prohibit air brake systems from being equipped with a means to release the spring brakes for purposes of towing disabled vehicles in emergency situations?

Guidance: No, provided the brakes are designed and maintained so they cannot be released unless adequate energy is available to make immediate reapplication of the brakes when the brake system is operable.

Question 3: Are parking brakes required on every CMV manufactured before March 7, 1990?

Guidance: No.

§393.42 Brakes Required on all Wheels

Question 1: Do retractable or lift axles have to be equipped with brakes?

Guidance: Yes, when the wheels are in contact with the roadway.

Question 2: Are unladen converter dollies covered by the exemption in §393.42(b)(3)?

Guidance: Yes. However, if the converter dolly is laden, the brakes must be operable.

Question 3: §393.42(b)(3) of the FMCSRs states that any full trailer, any semi-trailer, or any pole trailer having a GVWR of 3,000 pounds or less must be equipped with brakes if the weight of the towed vehicle resting on the towing vehicle exceeds 40 percent of the GVWR of the towing vehicle. Is the manufacturer of the trailer responsible for ensuring that the trailer is equipped with brakes when required?

Guidance: No. The motor carrier pulling the trailer is responsible for ensuring that the trailer is in compliance with all applicable FMCSRs.

§393.43 Breakaway and Emergency Braking System

Question 1: Are tractor protection valves required by §393.43(b), or may similar devices be used?

Guidance: No. Similar devices may be used provided the devices meet the performance requirements of §393.43(b).

Question 2: Are all brakes on a trailer required to be applied automatically upon breakaway?

Guidance: Yes.

§393.44 Front Brake Lines, Protection

Question 1: Does the term “rear wheels” include the tag axle on a bus/motorcoach?

Guidance: Yes. The braking system on a bus/motorcoach must be constructed so that if any brake line to either front wheel is broken, the driver can apply the brakes to all of the wheels on each rear axle.

Notes

§393.48 Brakes to be Operative

Question 1: If a CMV manufactured on or after July 25, 1980 (see §393.42) has brake components on the front axle, and the brakes are not operable, does the vehicle comply with §393.48?

Guidance: No.

Question 2: If a truck or truck tractor manufactured prior to July 25, 1980, and having 3 or more axles, has inoperable brakes on the front axle or some of the brake components are missing, would the vehicle be in violation of §393.48?

Guidance: Yes. §393.48(a) requires that all brakes with which the vehicle is equipped must be operable at all times. Although §393.42(b)(1) provides an exception to the requirement for brakes on all wheels for trucks and truck tractors with 3 or more axles and manufactured prior to July 25, 1980, the exception does not affect the applicability of §393.48 for those cases in which the vehicle is equipped with inoperable front wheel brakes or only has certain portions of the front wheel brake system (e.g., shoes, linings, chambers, hoses) in place.

Question 3: Are the brakes on a vehicle towed in a driveaway-towaway operation or towed disabled vehicle required to be operable at all times?

Guidance: §393.48(c) provides an exception to the requirement that brakes be operable at all times. This exception covers disabled vehicles being towed and vehicles towed in driveaway-towaway operation.

The driveaway-towaway exception in §393.48(c) is contingent upon the conditions outlined in §393.42(b)(2). Towed vehicles must have brakes as may be necessary to ensure compliance with the performance requirements of §393.52. A motor vehicle towed by means of a tow-bar when any other vehicle is full-mounted on the towed vehicle, or any combination of motor vehicles utilizing 3 or more saddle-mounts, would not be covered under the exception found at §393.48(c).

With regard to the disabled-vehicle provision of §393.48(c)(1), the combination vehicle would have to meet the applicable performance requirements of §393.52.

§393.51 Warning Devices and Gauges

Question 1: Is the low pressure warning device required to activate before the tractor protection valve?

Guidance: No. §393.51 does not explicitly require the warning device to operate before the protection valve. It is implied that if the operating pressure of the warning device is at least ½ of the governor cut-out pressure, and that pressure is not less than the pressure at which the protection valve (or similar device) activates, the requirements of §393.51 are satisfied.

Question 2: Is the vacuum portion of vacuum-assisted hydraulic brake systems required to have a warning device?

Guidance: No. Only the hydraulic portion of vacuum-assisted hydraulic brake systems is required to have a warning device. FMVSS No. 105 does not require a warning device for the vacuum portion of the vacuum-assisted hydraulic brake systems. It is the intention of the FHWA that §393.51 be consistent with FMVSS No. 105.

Question 3: Are vacuum gauges required on the vacuum portion of vacuum-assisted hydraulic brakes?

Regulations

Guidance: No. §393.51(d)(2) requires only that CMVs with vacuum brakes (not hydraulic brakes applied or assisted by vacuum) be equipped with a vacuum gauge.

Question 4: Is a warning device required in a CMV with a single hydraulic brake system which uses the driveline parking brake as the emergency brake system?

Guidance: No. Warning devices are not required on such CMVs because the driver will be given ample warning of system failure by the movement and feel of the brake pedal.

Question 5: What difference, if any, is there between a warning device and a warning signal?

Guidance: For purposes of §393.51, the terms may be used interchangeably.

§393.52 Brake Performance

Question 1: May the information in the stopping distance table be used to determine the stopping distances at speeds greater than 20 mph?

Guidance: No, the table is not intended to be used to predict or determine stopping distances at speeds greater than 20 mph.

§393.60 Glazing in Specified Openings

Question 1: May windshields and side windows be tinted?

Guidance: Yes, as long as the light transmission is not restricted to less than 70 percent of normal (refer to the American Standards Association publication Z26.1-1966 and Z26.1a-1969).

Question 2: May a decal designed to comply with the periodic inspection documentation requirements of §396.17 be displayed on the windshields or side windows of a CMV?

Guidance: Yes, provided the decal is being used in lieu of an inspection report and is in compliance with §393.60(c).

Question 3: If a crack extended into the thickness of the glass at such an angle as to measure ¼" or more, measuring from the top edge of the crack on the outside surface of the windshield to vertical line drawn through the windshield to the far edge of this angled crack on the inside of the windshield, would this constitute a crack of ¼" or more in width as defined in §393.60(b)(2)?

Guidance: No. The crack, in order to fall outside the exception, would have to be a gap of ¼" or more on the same surface of the windshield.

§393.61 Window Construction

Question 1: Do school buses used for purposes other than school bus operations (as defined in §390.5), have to meet additional emergency exits requirements under §393.61?

Guidance: Yes. §393.61(b)(2) says that "a bus, including a school bus, manufactured on and after September 1, 1973," must conform with NHTSA's §571.217 (FMVSS 217). At the time this provision was adopted, FMVSS 217 applied only to other buses and it was optional for school buses. The FHWA inserted the language, "including school buses," in §393.61(b)(2) to make clear that school buses used in interstate commerce and, therefore, subject to the FMCSRs, were required to comply with the bus exit standards in Standard FMVSS 217.

Notes

Vehicle Maintenance Pro

Notes

Sec. 393.61(b)(3) regarding push-out windows provides that older buses must conform with the requirements of §§393.61(b) or 571.217. Buses which are subject to §571.217 would follow NHTSA's interpretation on push-out windows. Buses which are subject to §393.61(b)(1) of the FMCSRs are required to have emergency windows that are either push-out windows or that have laminated safety glass that can be pushed out in a manner similar to a push-out window.

Question 2: For emergency exits which consist of laminated safety glass, is the window frame or sash required to move outward from the bus as is the case with push-out windows?

Guidance: No. Laminated safety glass is an alternative to the use of push-out windows for buses manufactured before September 1, 1973. §393.61(c) requires that every glazed opening used to satisfy the emergency exit space requirements, "if not glazed with laminated safety glass, shall have a frame or sash so designed, constructed, and maintained that it will yield outwardly to provide the required free opening. * * *" Laminated safety glass meeting Test No. 25, Egress, American National Standard "Safety Code for Safety Glazing Materials for Glazing Motor Vehicles Operating on Land Highways," Z26.1-1966 as supplemented by Z26.1a-1969 (referenced in §§393.61(c) and 393.60(a)) is intended to provide an adequate means of emergency exit on older buses without resorting to push-out windows.

However, buses with a seating capacity of more than 10 people manufactured after September 1, 1973, must have push-out windows that conform to 49 CFR 571.217

Question 3: When calculating the minimum emergency exit space required on school buses used in non-school bus operations, should two or three passengers per bench seat be used in determining the adult seating capacity?

Guidance: The NHTSA has indicated that "School buses can transport 3 to a seat if the passengers are in grades 1 through 5, and 2 per seat in grades 9 through 12." (May 9, 1995, 60 FR 24562, 24567) Therefore, for vehicles originally manufactured as school buses, the total pupil seating capacity provided by the bus manufacturer should be multiplied by $\frac{2}{3}$ to determine the adult seating capacity for the purposes of §393.61. This generally yields the same result as using two adults per bench seat.

Question 4: Do school buses which meet the school bus emergency exit requirements established by the NHTSA's November 2, 1992, final rule on FMVSS No. 217 have to be retrofitted with additional emergency exits when used in interstate commerce for non-school bus operations?

Guidance: No. On May 9, 1995, the NHTSA amended FMVSS No. 217 to permit non-school buses to meet either the current non-school bus emergency exit requirements or the upgraded school bus exit requirements established by the November 2, 1992 (57 FR 49413), final rule which became effective on September 1, 1994. Therefore, school buses which meet the upgraded emergency exit standards meet the requirements of §393.61 without the retrofitting of additional exits.

Question 5: Which edition of FMVSS No. 217 is required to be used in determining the emergency exit space requirements when retrofitting buses?

Guidance: The cross reference to FMVSS No. 217 applies to the requirements in effect at the time of manufacture of the bus. Motor carriers are not, however, prohibited from retrofitting their buses to the most up-to-date requirements in FMVSS No. 217. Therefore, at a minimum, motor carriers must meet the non-school bus emergency exit requirements in effect at the time of manufacture, and

Regulations

have the option of retrofitting their buses to meet the emergency exit requirements established by the November 2, 1992 (57 FR 49413), final rule which became effective on September 1, 1994.

§393.62 Window Obstructions

Question 1: May a bus being operated by a for-hire motor carrier of passengers, under contract with a governmental agency to provide transportation of prisoners in interstate commerce, be allowed to operate with security bars covering the emergency push-out windows and with locked emergency door exits?

Guidance: Yes. Even when the transportation is performed by a contract carrier, the welfare, safety, and security of the prisoners is under the authority of the governmental corrections agency and, thus, the agency may require additional security measures. For these types of operations, a carrier may meet the special security requirements of the governmental corrections agency regarding emergency exits. However, CMVs that have been modified to meet the security requirements of the corrections agency may not be used for other purposes that are subject to the FMCSRs unless they meet the emergency exit requirements.

§393.65 All Fuel Systems

Question 1: May a fuel fill pipe opening be placed above the passenger floor level if it is not physically within the passenger compartment?

Guidance: Yes. In addition, the fill pipe may intrude into the passenger compartment as long as the fill pipe opening complies with §393.65(b)(4), and the fill pipe is protected by a housing or covering to prevent leakage of fuel or fumes into the passenger compartment.

Question 2: Must a motor vehicle that meets the definition of a “commercial motor vehicle” in §390.5 because it transports hazardous materials in a quantity requiring placarding under the Hazardous Materials Regulations (49 CFR parts 171-180) comply with the fuel system requirements of Subpart E of Part 393, even though it has a gross vehicle weight rating (GVWR) of 10,000 pounds or less?

Guidance: No. FMVSS No.301 contains fuel system integrity requirements for passenger cars and multipurpose passenger vehicles, trucks, and buses that have a GVWR of 10,000 pounds or less and use fuel with a boiling point above 0 deg. Celsius (32 deg. Fahrenheit). Subpart E of part 393 was issued to provide fuel system requirements to cover motor vehicles with a GVWR of 10,001 or more pounds. The fuel systems of placarded motor vehicles with a GVWR of less than 10,001 pounds are adequately addressed by FMVSS No. 301 and compliance with subpart E of part 393 would be redundant. However, commercial motor vehicles that are not covered by FMVSS No. 301 must continue to comply with subpart E of part 393.

§393.67 Liquid Fuel Tanks

Question 1: May a properly vented fuel cap be used on a fuel tank equipped with another fuel venting system?

Guidance: Yes (see §393.3).

Question 2: Do the FMCSRs specify a particular pressure relief system?

Guidance: No, but the performance standards of §393.67(d) must be met.

Question 3: What standards under the FMCSRs must be met when a liquid fuel tank is repaired or replaced?

Notes

Vehicle Maintenance Pro

Notes

Guidance: A replacement/repaired tank must meet the applicable standards in §393.67.

§393.70 Coupling Devices and Towing Methods, Except for Driveaway-Towaway Operations

Question 1: Is there a minimum number of fasteners required to fasten the upper fifth wheel plate to the frame of a trailer?

Guidance: The FMCSRs do not specify a minimum number of fasteners. However, the industry recommends that a minimum of ten $\frac{5}{8}$ inch bolts be used. If $\frac{1}{2}$ inch bolts are used, the industry recommends at least 14 bolts. The CVSA has adopted these industry standards as a part of its vehicle out-of-service criteria.

Question 2: When two safety chains are used, must the ultimate combined breaking strength of each chain be equal to the gross weight of the towed vehicle(s) or would the requirements be met if the combined breaking strength of the two chains is equal to the gross weight of the towed vehicle(s)?

Guidance: If the ultimate combined breaking strength of the two chains is equal to the gross weight of the towed vehicle(s), the requirements of §393.70(d) are satisfied. It should be noted that some States may have more stringent requirements for safety chains.

Question 3: §393.70(d) requires that every full trailer must be coupled to the frame, or an extension of the frame, of the motor vehicle which tows it with one or more safety devices to prevent the towed vehicle from breaking loose in the event the tow-bar fails or becomes disconnected. The safety device must be connected to the towed and towing vehicles and to the tow-bar in a manner which prevents the tow-bar from dropping to the ground in the event it fails or becomes disconnected. Would the use of a pair of safety chains/cables between the towing vehicle and the front of a fixed-length draw bar, or an extendible draw bar, with a separate pair of safety chains/cables between the end of the draw bar and the front of the towed vehicle meet the requirements of §393.70(d)?

Guidance: Generally, separate safety devices at the front and rear of the draw bar could be used to satisfy the requirements of §393.70(d) provided the safety devices are attached to the draw-bar and the vehicles in a manner that prevents the drawbar from dropping to the ground in the event that it fails or becomes disconnected. Also, the arrangement of the safety device(s) must be such that the vehicles will not separate if the draw bar fails or becomes disconnected.

If the drawbar design is such that bolts, connecting pins, etc., are used to connect structural members of the drawbar, and are located at or near the midpoint of the drawbar (beyond the attachment points for the safety chain at the ends of the draw bar) the safety devices would have to extend from either the frame of the towed or towing vehicle to a point beyond the bolts, connecting pins or similar devices.

In the case of an extendible draw bar or reach, if a separate safety device(s) is used for the front and rear of the drawbar, a means must be provided to ensure that the draw bar will not separate at the movable portion of the drawbar. The use of welded tube stops would satisfy the intent of §393.70(d) if the ultimate strength of the welds exceeds the impact forces associated with the drawbar extending suddenly with a fully loaded trailer attached.

§393.71 Coupling Devices and Towing Methods, Driveaway-Towaway Operations

Question 1: May a fifth wheel be considered as a coupling device when towing a semi-trailer in a driveaway-towaway operation?

Regulations

Guidance: Yes. §393.71(g) requires the use of a tow-bar or a saddle-mount. Since a saddle-mount performs the function of a conventional fifth wheel, the use of a fifth wheel is consistent with the requirements of this section.

§393.75 Tires

Question 1: If a CMV has a defective tire, may the driver remove the defective tire from the axle and drive with three tires on an axle instead of four?

Guidance: Yes, provided the weight on all of the remaining tires does not exceed the maximum allowed under §393.75(f).

Question 2: May a CMV be operated with tires that carry a greater weight than the weight marked on the side wall of the tires?

Guidance: Yes, but only if the CMV is being operated under the terms of a State-issued special permit, and at a reduced speed that is appropriate to compensate for tire loading in excess of the rated capacity.

Question 3: May a vehicle transport HM when equipped with retreaded tires?

Guidance: Yes. The only CMV that may not utilize retreaded tires is a bus, and then only on its front wheels.

Question 4: May tires be filled with materials other than air (e.g., silicone, polyurethane)?

Guidance: §393.75 does not prohibit the use of tires filled with material other than air. However, §393.3 may prohibit the use of such tires under certain circumstances. Some substances used in place of air in tires may not maintain a constant physical state at different temperatures. While these substances are solid at lower temperatures, the increase in temperature from highway use may result in the substance changing from a solid to a liquid. The use of a substance which could undergo such a change in its physical characteristics is not safe, and is not in compliance with §393.3.

§393.76 Sleeper Berths

Question 1: If a compartment in a CMV is no longer used as a sleeper berth, must it be maintained and equipped as a sleeper berth as required in §393.76?

Guidance: No.

§393.78 Windshield Wipers

Question 1: Are windshield washer systems required?

Guidance: No, only windshield wipers are required.

§393.81 Horn

Question 1: Do the FMCSRs specify what type of horn is to be used on a CMV?

Guidance: No.

Question 2: Are there established criteria in the FMCSRs to determine the minimum sound level of horns on CMVs?

Guidance: No.

§393.82 Speedometer

Question 1: What does the phrase “reasonable accuracy” mean?

Guidance: “Reasonable accuracy” is interpreted to mean accuracy to within plus or minus 5 mph at a speed of 50 mph.

Notes

Vehicle Maintenance Pro

Notes

§393.83 Exhaust System

Question 1: Is a heat shield mandatory on a vertical exhaust stack?

Guidance: No. However, §393.83 requires the placement of the exhaust system in such a manner as to prevent the burning, charring, or damaging of the electrical wiring, the fuel supply, or any combustible part of the CMV.

Question 2: Does §393.83 specify the type of exhaust system, vertical or horizontal, to be used on trucks or truck tractors?

Guidance: No.

§393.87 Flags on Projecting Loads

Question 1: May a triangular-shaped flag or device be used by itself to mark an oversized load?

Guidance: No. However, nothing prohibits using a triangular-shaped flag in conjunction with the prescribed flag.

§393.88 Television Receivers

Question 1: Does §393.88 restrict the use of closed circuit monitor devices being used as a safety viewing system that would eliminate blind-side motor carrier accidents?

Guidance: No. The restriction of this section would not apply because the device cannot receive television broadcasts or be used for the viewing of video tapes.

§393.89 Buses, Drive Shaft Protection

Question 1: For the purposes of §393.89, would a spline and yoke that is secured by a nut be considered a sliding connection?

Guidance: No. To be considered a sliding connection, the spline must be able to move within the sleeve. When the end of the spline is secured by a nut, it no longer has that freedom.

Question 2: On multiple drive shaft buses, does §393.89 require that all segments of the drive shaft be protected no matter the segments' length?

Guidance: Yes. Each drive shaft must have one guard or bracket for each end of a shaft which is provided with a sliding connection (spline or other such device).

Question 3: How does an existing pillow bearing (shaft support) on a multiple driveshaft system affect the requirement?

Guidance: It does not affect the requirement. It is part of the requirement.

§393.92 Buses, Marking Emergency Doors

Question 1: Is a contractor-operated school bus operating in interstate commerce required to have emergency lights over the exit door?

Guidance: Yes. Any bus used in interstate commerce for other than school bus operations, as defined in §390.5, is subject to the FMCSRs.

§393.93 Seats, Seat Belt Assemblies, and Seat Belt Assembly Anchorages

Question 1: If a CMV, other than a motor coach, is equipped with a passenger seat, is a seat belt required for the passenger seat?

Guidance: Yes.

Regulations

§393.95 Emergency equipment on all power units

Question 1: Are pressure gauges the only acceptable means for a visual determination that a fire extinguisher is fully charged?

Guidance: No, as long as there is some means to permit a visual determination that a fire extinguisher is fully charged.

§393.100 General rules for protection against shifting or falling cargo

Question 1: When securing cargo, is the use of a tiedown every 10 linear feet, or fraction thereof, adequate?

Guidance: Yes, as long as the aggregate strength of the tie-downs is equal to the requirements of §393.102, and each article is secured.

Question 2: [Removed and reserved]

Question 3: Are the requirements of §393.100 the only cargo securement requirements motor carriers must comply with?

Guidance: No. A motor carrier, when transporting cargo, must comply with all the applicable cargo securement requirements of subpart I and §392.9.

Question 4: Do the rules for protection against shifting or falling cargo apply to CMVs with enclosed cargo areas?

Guidance: Yes. All CMVs transporting cargo must comply with the applicable provisions of §§393.100-393.106(subpart I) to prevent the shifting or falling of cargo aboard the vehicle.

Question 5: [Removed and reserved]

Question 6: [Removed and reserved]

§393.102 Securement systems

Question 1: Does §393.102(b) prohibit the use of securement devices for which manufacturing standards have not been incorporated by reference?

Guidance: §393.102(b) requires that chain, wire rope, synthetic webbing, cordage, and steel strapping meet minimum manufacturing standards. It does not, however, prohibit the use of other types of securement devices or establish manufacturing standards for those devices. Therefore, if the securement device(s) has an aggregate working load limit of at least ½ the weight of the article, and the load is secured to prevent it from shifting or falling from the vehicle, §§393.100 and 393.102(b) would be satisfied.

If the cargo is not firmly braced against a front-end structure that conforms to the requirements of §393.106, the securement system would have to provide protection against longitudinal movement [§393.104(a)]. If the load may shift sideways in transit then §393.104(b) would also be applicable.

Question 2: Does §393.102(b) require that securement devices be marked or labeled with their working load limit or any other information?

Guidance: No. Although §393.102(b) requires chain, wire rope, synthetic webbing, cordage, and steel strapping tiedowns to meet applicable manufacturing standards, it explicitly excludes marking identification provisions of those manufacturing standards. Since §393.102(b) does not establish manufacturing standards or marking requirements for other types of securement devices, such devices are not required to be marked with their working load limit.

Notes

Vehicle Maintenance Pro

Notes

§393.106 Front-end structure

Question 1: When describing a headerboard or cab protection device, the regulations state that similar devices may be used. What is meant by the term “similar devices”?

Guidance: The term “similar devices” has reference to devices equivalent in strength and function, though not necessarily in appearance and construction, to headerboards.

§393.130 What are the rules for securing heavy vehicles, equipment and machinery?

***Question 1:** If an item of construction equipment which weighs less than 4,536 kg (10,000 lb.) is transported on a flatbed or drop-deck trailer, must the accessory equipment be lowered to the deck of the trailer?

Guidance: No. However, the accessory equipment must be properly secured using locking pins or similar devices in order to prevent either the accessory equipment or the item of construction equipment itself from shifting during transport.

***Question 2:** How should I secure the accessories for an item of construction equipment which weighs 4,536 kg (10,000 lb.) or more, if the accessory devices would extend beyond the width of the trailer if they are lowered to the deck for transport?

Guidance: The accessory devices (plows, trencher bars, and the like) may be transported in a raised position, provided they are designed to be transported in that manner. However, the accessory equipment must be locked in place for transport to ensure that neither the accessories nor the equipment itself shifts during transport.

***Question 3:** A tractor loader-backhoe weighing over 10,000 pounds is being transported on a trailer. The loader and backhoe accessories are each equipped with locking devices or mechanisms that prevent them from moving up and down and from side-to-side while the construction equipment is being transported on the trailer. Must these accessories also be secured to the trailer with chains?

Guidance: No. However, if the construction equipment does not have a means of preventing the loader bucket, backhoe, or similar accessories from moving while it is being transported on the trailer, then a chain would be required to secure those accessories to the trailer.

***Editor’s Note:** This interpretation was issued after the interpretations were published in the *Federal Register* in April 1997.

§393.201 Frames

Question 1: Are cross members of CMVs considered part of the frame?

Guidance: Yes.

Special topics — CMV parts and accessories

Question 1: Do tires marked “NHS” (not for highway service) mean that highway use is prohibited by §393.75?

Guidance: No, provided the use of such tires does not decrease the safety of operations (see Periodic Inspection Requirements, Appendix G to subpart B).

Regulations

Part 396—Inspection, repair, and maintenance

Sec.	
396.1	Scope.
396.3	Inspection, repair, and maintenance.
396.5	Lubrication.
396.7	Unsafe operations forbidden.
396.9	Inspection of motor vehicles and intermodal equipment in operation.
396.11	Driver vehicle inspection report(s).
396.12	Procedures for intermodal equipment providers to accept reports required by §390.42(b) of this chapter.
396.13	Driver inspection.
396.15	Driveaway-towaway operations, and inspections.
396.17	Periodic inspection.
396.19	Inspector qualifications.
396.21	Periodic inspection recordkeeping requirements.
396.23	Equivalent to periodic inspection.
396.25	Qualifications of brake inspectors.

§396.1 Scope.

(a) Every motor carrier, its officers, drivers, agents, representatives, and employees directly concerned with the inspection or maintenance of commercial motor vehicles must be knowledgeable of and comply with the rules of this part.

(b) Every intermodal equipment provider, its officers, agents, representatives, and employees directly concerned with the inspection or maintenance of intermodal equipment interchanged or offered for interchange to motor carriers must be knowledgeable of and comply with the rules of this part.

(c) This part does not apply to “covered farm vehicles,” as defined in 49 CFR 390.5, or to the drivers of such vehicles.

§396.3 Inspection, repair and maintenance.

(a) **General.** Every motor carrier and intermodal equipment provider must systematically inspect, repair, and maintain, or cause to be systematically inspected, repaired, and maintained, all motor vehicles and intermodal equipment subject to its control.

(1) Parts and accessories shall be in safe and proper operating condition at all times. These include those specified in Part 393 of this subchapter and any additional parts and accessories which may affect safety of operation, including but not limited to, frame and frame assemblies, suspension systems, axles and attaching parts, wheels and rims, and steering systems.

(2) Pushout windows, emergency doors, and emergency door marking lights in buses shall be inspected at least every 90 days.

(b) **Required records.** Motor carriers, except for a private motor carrier of passengers (nonbusiness), must maintain, or cause to be maintained, records for each motor vehicle they control for 30 consecutive days. Intermodal equipment providers must maintain or cause to be maintained, records for each unit of intermodal

equipment they tender or intend to tender to a motor carrier. These records must include:

(1) An identification of the vehicle including company number, if so marked, make, serial number, year, and tire size. In addition, if the motor vehicle is not owned by the motor carrier, the record shall identify the name of the person furnishing the vehicle;

(2) A means to indicate the nature and due date of the various inspection and maintenance operations to be performed;

(3) A record of inspection, repairs and maintenance indicating their date and nature; and

(4) A record of tests conducted on pushout windows, emergency doors, and emergency door marking lights on buses.

(c) **Record retention**—The records required by this section shall be retained where the vehicle is either housed or maintained for a period of 1 year and for 6 months after the motor vehicle leaves the motor carrier’s control.

§396.5 Lubrication.

Every motor carrier shall ensure that each motor vehicle subject to its control is—

(a) properly lubricated; and

(b) free of oil and grease leaks.

§396.7 Unsafe operations forbidden.

(a) **General**—A motor vehicle shall not be operated in such a condition as to likely cause an accident or a breakdown of the vehicle.

(b) **Exemption**—Any motor vehicle discovered to be in an unsafe condition while being operated on the highway may be continued in operation only to the nearest place where repairs can safely be effected. Such operation shall be conducted only if it is less hazardous to the public than to permit the vehicle to remain on the highway.

§396.9 Inspection of motor vehicles and intermodal equipment in operation.

(a) Personnel authorized to perform inspections—Every special agent of the FMCSA (as defined in Appendix B to this subchapter) is authorized to enter upon and perform inspections of a motor carrier’s vehicles in operation and intermodal equipment in operation.

(b) Prescribed inspection report—The Driver Vehicle Examination Report shall be used to record results of motor vehicle inspections and results of intermodal equipment inspections conducted by authorized FMCSA personnel.

(c) **Motor vehicles and intermodal equipment declared “out-of-service.”** (1) Authorized personnel shall declare and mark “out-of-service” any motor vehicle or intermodal equipment which by reason of its mechanical condition or loading would likely cause an accident or a breakdown. An “Out-of-Service Vehicle” sticker shall be used to mark vehicles and intermodal equipment “out-of-service.”

(2) No motor carrier or intermodal equipment provider shall require or permit any person to operate nor shall

Vehicle Maintenance Pro

any person operate any motor vehicle or intermodal equipment declared and marked “out-of-service” until all repairs required by the “out-of-service notice” have been satisfactorily completed. The term *operate* as used in this section shall include towing the vehicle or intermodal equipment, except that vehicles or intermodal equipment marked “out-of-service” may be towed away by means of a vehicle using a crane or hoist. A vehicle combination consisting of an emergency towing vehicle and an “out-of-service” vehicle shall not be operated unless such combination meets the performance requirements of this subchapter except for those conditions noted on the Driver Vehicle Examination Report.

(3) No person shall remove the “Out-of-Service Vehicle” sticker from any motor vehicle or intermodal equipment prior to completion of all repairs required by the “out-of-service notice.”

(d) Motor carrier or intermodal equipment provider disposition.

(1) The driver of any motor vehicle, including a motor vehicle transporting intermodal equipment, who receives an inspection report shall deliver a copy to both the motor carrier operating the vehicle and the intermodal equipment provider upon his/her arrival at the next terminal or facility. If the driver is not scheduled to arrive at a terminal or facility of the motor carrier operating the vehicle or at a facility of the intermodal equipment provider within 24 hours, the driver shall immediately mail, fax, or otherwise transmit the report to the motor carrier and intermodal equipment provider.

(2) Motor carriers and intermodal equipment providers shall examine the report. Violations or defects noted thereon shall be corrected. Repairs of items of intermodal equipment placed out-of-service are also to be documented in the maintenance records for such equipment.

(3) Within 15 days following the date of the inspection, the motor carrier or intermodal equipment provider shall—

(i) Certify that all violations noted have been corrected by completing the “Signature of Carrier/Intermodal Equipment Provider Official, Title, and Date Signed” portions of the form; and

(ii) Return the completed roadside inspection form to the issuing agency at the address indicated on the form and retain a copy at the motor carrier’s principal place of business, at the intermodal equipment provider’s principal place of business, or where the vehicle is housed for 12 months from the date of the inspection.

§396.11 Driver vehicle inspection report(s).

(a) **Equipment provided by motor carrier.** (1) **Report required.** Every motor carrier shall require its drivers to report, and every driver shall prepare a report in writing at the completion of each day’s work on each vehicle operated, except for intermodal equipment tendered by an intermodal equipment provider. The report shall cover at least the following parts and accessories:

- (i) Service brakes including trailer brake connections;
- (ii) Parking brake;
- (iii) Steering mechanism;
- (iv) Lighting devices and reflectors;

- (v) Tires;
- (vi) Horn;
- (vii) Windshield wipers;
- (viii) Rear vision mirrors;
- (ix) Coupling devices;
- (x) Wheels and rims;
- (xi) Emergency equipment.

(2) **Report content.** The report shall identify the vehicle and list any defect or deficiency discovered by or reported to the driver which would affect the safety of operation of the vehicle or result in its mechanical breakdown. If no defect or deficiency is discovered by or reported to the driver, the report shall so indicate. In all instances, the driver shall sign the report. On two-driver operations, only one driver needs to sign the driver vehicle inspection report, provided both drivers agree as to the defects or deficiencies identified. If a driver operates more than one vehicle during the day, a report shall be prepared for each vehicle operated.

(3) **Corrective action.** (i) Prior to requiring or permitting a driver to operate a vehicle, every motor carrier or its agent shall repair any defect or deficiency listed on the driver vehicle inspection report which would be likely to affect the safety of operation of the vehicle.

(ii) Every motor carrier or its agent shall certify on the original driver vehicle inspection report which lists any defect or deficiency that the defect or deficiency has been repaired or that repair is unnecessary before the vehicle is operated again.

(4) **Retention period for reports.** Every motor carrier shall maintain the original driver vehicle inspection report, the certification of repairs, and the certification of the driver’s review for three months from the date the written report was prepared.

(5) **Exceptions.** The rules in this section shall not apply to a private motor carrier of passengers (nonbusiness), a driveaway-towaway operation, or any motor carrier operating only one commercial motor vehicle.

(b) **Equipment provided by intermodal equipment provider.** (1) **Report required.** Every intermodal equipment provider must have a process to receive driver reports of, and each driver or motor carrier transporting intermodal equipment must report to the intermodal equipment provider or its designated agent, any known damage, defects, or deficiencies in the intermodal equipment at the time the equipment is returned to the provider or the provider’s designated agent. The report must include, at a minimum, the following parts and accessories:

- (i) Brakes;
- (ii) Lighting devices, lamps, markers, and conspicuity marking material;
- (iii) Wheels, rims, lugs, tires;
- (iv) Air line connections, hoses, and couplers;
- (v) King pin upper coupling device;
- (vi) Rails or support frames;
- (vii) Tie down bolsters;
- (viii) Locking pins, clevises, clamps, or hooks;

Regulations

(ix) Sliders or sliding frame lock.

(2) **Report content.** (i) Name of the motor carrier responsible for the operation of the intermodal equipment at the time the damage, defects, or deficiencies were discovered by, or reported to, the driver.

(ii) Motor carrier's USDOT number; intermodal equipment provider's USDOT number, and a unique identifying number for the item of intermodal equipment.

(iii) Date and time the report was submitted.

(iv) All damage, defects, or deficiencies of the intermodal equipment reported to the equipment provider and discovered by, or reported to, the motor carrier or its driver which would

(A) Affect the safety of operation of the intermodal equipment, or

(B) Result in its mechanical breakdown while transported on public roads.

(v) The signature of the driver who prepared the report.

(3) **Corrective action.** (i) Prior to allowing or permitting a motor carrier to transport a piece of intermodal equipment for which a motor carrier or driver has submitted a report about damage, defects or deficiencies, each intermodal equipment provider or its agent must repair the reported damage, defects, or deficiencies that are likely to affect the safety of operation of the vehicle.

(ii) Each intermodal equipment provider or its agent must certify on the original driver's report which lists any damage, defects, or deficiencies of the intermodal equipment that the reported damage, defects, or deficiencies have been repaired, or that repair is unnecessary, before the vehicle is operated again.

(4) **Retention period for reports.** Each intermodal equipment provider must maintain all documentation required by this section, including the original driver report and the certification of repairs on all intermodal equipment, for a period of three months from the date that a motor carrier or its driver submits the report to the intermodal equipment provider or its agent.

(c) **Corrective action.** Prior to requiring or permitting a driver to operate a vehicle, every motor carrier or its agent shall repair any defect or deficiency listed on the driver vehicle inspection report which would be likely to affect the safety of operation of the vehicle.

(1) Every motor carrier or its agent shall certify on the original driver vehicle inspection report which lists any defect or deficiency that the defect or deficiency has been repaired or that repair is unnecessary before the vehicle is operated again.

(2) Every motor carrier shall maintain the original driver vehicle inspection report, the certification of repairs, and the certification of the driver's review for three months from the date the written report was prepared.

(d) **Exceptions.** The rules in this section shall not apply to a private motor carrier of passengers (nonbusiness), a driveaway-towaway operation, or any motor carrier operating only one commercial motor vehicle.

§396.12 Procedures for intermodal equipment providers to accept reports required by §390.42(b) of this chapter.

(a) **System for reports.** Each intermodal equipment provider must establish a system for motor carriers and drivers to report to it any damage, defects, or deficiencies of intermodal equipment discovered by, or reported to, the motor carrier or driver which would—

(1) Affect the safety of operation of the intermodal equipment, or

(2) Result in its mechanical breakdown while transported on public roads.

(b) **Report content.** The system required by paragraph (a) of this section must include documentation of all of the following:

(1) Name of the motor carrier responsible for the operation of the intermodal equipment at the time the damage, defects, or deficiencies were discovered by, or reported to, the driver.

(2) Motor carrier's USDOT number; intermodal equipment provider's USDOT number, and a unique identifying number for the item of intermodal equipment.

(3) Date and time the report was submitted.

(4) All damage, defects, or deficiencies of the intermodal equipment must be reported to the equipment provider by the motor carrier or its driver. If no defect or deficiency in the intermodal equipment is discovered by or reported to the driver, no written report is required.

(5) The signature of the driver who prepared the report.

(c) **Corrective action.** (1) Prior to allowing or permitting a motor carrier to transport a piece of intermodal equipment for which a motor carrier or driver has submitted a report about damage, defects or deficiencies, each intermodal equipment provider or its agent must repair the reported damage, defects, or deficiencies that are likely to affect the safety of operation of the vehicle.

(2) Each intermodal equipment provider or its agent must certify on the original driver's report which lists any damage, defects, or deficiencies of the intermodal equipment that the reported damage, defects, or deficiencies have been repaired, or that repair is unnecessary, before the vehicle is operated again.

(d) **Retention period for reports.** Each intermodal equipment provider must maintain all documentation required by this section, including the original driver report and the certification of repairs on all intermodal equipment, for a period of three months from the date that a motor carrier or its driver submits the report to the intermodal equipment provider or its agent.

§396.13 Driver inspection.

Before driving a motor vehicle, the driver shall:

(a) Be satisfied that the motor vehicle is in safe operating condition;

(b) Review the last driver vehicle inspection report; and

(c) Sign the report, only if defects or deficiencies were noted by the driver who prepared the report, to acknowledge that the driver has reviewed it and that there is a

Vehicle Maintenance Pro

certification that the required repairs have been performed. The signature requirement does not apply to listed defects on a towed unit which is no longer part of the vehicle combination.

§396.15 Driveaway-towaway operations and inspections.

(a) **General.** Effective December 7, 1989, every motor carrier, with respect to motor vehicles engaged in driveaway-tow-away operations, shall comply with the requirements of this part. Exception: Maintenance records required by §396.3, the vehicle inspection report required by §396.11, and the periodic inspection required by §396.17 of this part shall not be required for any vehicle which is part of the shipment being delivered.

(b) **Pre-trip inspection.** Before the beginning of any driveaway-towaway operation of motor vehicles in combination, the motor carrier shall make a careful inspection and test to ascertain that:

(1) The tow-bar or saddle-mount connections are properly secured to the towed and towing vehicle;

(2) They function adequately without cramping or binding of any of the parts; and

(3) The towed motor vehicle follows substantially in the path of the towing vehicle without whipping or swerving.

(c) **Post-trip inspection.** Motor carriers shall maintain practices to ensure that following completion of any trip in driveaway-towaway operation of motor vehicles in combination, and before they are used again, the tow-bars and saddle-mounts are disassembled and inspected for worn, bent, cracked, broken, or missing parts. Before reuse, suitable repair or replacement shall be made of any defective parts and the devices shall be properly reassembled.

§396.17 Periodic inspection.

(a) Every commercial motor vehicle must be inspected as required by this section. The inspection must include, at a minimum, the parts and accessories set forth in appendix G of this subchapter. The term *commercial motor vehicle* includes each vehicle in a combination vehicle. For example, for a tractor semitrailer, full trailer combination, the tractor, semitrailer, and the full trailer (including the converter dolly if so equipped) must each be inspected.

(b) Except as provided in §396.23 and this paragraph, motor carriers must inspect or cause to be inspected all motor vehicles subject to their control. Intermodal equipment providers must inspect or cause to be inspected intermodal equipment that is interchanged or intended for interchange to motor carriers in intermodal transportation.

(c) A motor carrier must not use a commercial motor vehicle, and an intermodal equipment provider must not tender equipment to a motor carrier for interchange, unless each component identified in appendix G of this subchapter has passed an inspection in accordance with the terms of this section at least once during the preceding 12 months and documentation of such inspection is on the vehicle. The documentation may be:

(1) The inspection report prepared in accordance with §396.21(a), or

(2) Other forms of documentation, based on the inspection report (e.g., sticker or decal), which contains the following information:

(i) The date of inspection;

(ii) Name and address of the motor carrier, intermodal equipment provider, or other entity where the inspection report is maintained;

(iii) Information uniquely identifying the vehicle inspected if not clearly marked on the motor vehicle; and

(iv) A certification that the vehicle has passed an inspection in accordance with §396.17.

(d) A motor carrier may perform the required annual inspection for vehicles under the carrier's control which are not subject to an inspection under §396.23(b)(1). An intermodal equipment provider may perform the required annual inspection for intermodal equipment interchanged or intended for interchange to motor carriers that are not subject to an inspection under §396.23(b)(1).

(e) In lieu of the self-inspection provided for in paragraph (d) of this section, a motor carrier or intermodal equipment provider responsible for the inspection may choose to have a commercial garage, fleet leasing company, truck stop, or other similar commercial business perform the inspection as its agent, provided that business operates and maintains facilities appropriate for commercial vehicle inspections and it employs qualified inspectors, as required by §396.19.

(f) Vehicles passing roadside or periodic inspections performed under the auspices of any State government or equivalent jurisdiction or the FMCSA, meeting the minimum standards contained in appendix G of this subchapter, will be considered to have met the requirements of an annual inspection for a period of 12 months commencing from the last day of the month in which the inspection was performed. If a vehicle is subject to a mandatory State inspection program, as provided in §396.23(b)(1), a roadside inspection may only be considered equivalent if it complies with the requirements of that program.

(g) It is the responsibility of the motor carrier or intermodal equipment provider to ensure that all parts and accessories on commercial motor vehicles intended for use in interstate commerce for which they are responsible are maintained at, or promptly repaired to, the minimum standards set forth in appendix G to this subchapter.

(h) Failure to perform properly the annual inspection required by this section shall cause the motor carrier or intermodal equipment provider to be subject to the penalty provisions of 49 U.S.C. 521(b).

§396.19 Inspector qualifications.

(a) Motor carriers and intermodal equipment providers must ensure that individuals performing annual inspections under §396.17(d) or (e) are qualified as follows:

(1) Understand the inspection criteria set forth in part 393 and appendix G of this subchapter and can identify defective components;

Regulations

(2) Are knowledgeable of and have mastered the methods, procedures, tools and equipment used when performing an inspection; and

(3) Are capable of performing an inspection by reason of experience, training, or both as follows:

(i) Successfully completed a Federal- or State-sponsored training program or have a certificate from a State or Canadian Province that qualifies the individuals to perform commercial motor vehicle safety inspections, or

(ii) Have a combination of training or experience totaling at least 1 year. Such training or experience may consist of:

(A) Participation in a commercial motor vehicle manufacturer-sponsored training program or similar commercial training program designed to train students in commercial motor vehicle operation and maintenance;

(B) Experience as a mechanic or inspector in a motor carrier or intermodal equipment maintenance program;

(C) Experience as a mechanic or inspector in commercial motor vehicle maintenance at a commercial garage, fleet leasing company, or similar facility; or

(D) Experience as a commercial motor vehicle inspector for a State, Provincial or Federal government.

(b) Motor carriers and intermodal equipment providers must retain evidence of that individual's qualifications under this section. They must retain this evidence for the period during which that individual is performing annual motor vehicle inspections for the motor carrier or intermodal equipment provider, and for one year thereafter. However, motor carriers and intermodal equipment providers do not have to maintain documentation of inspector qualifications for those inspections performed either as part of a State periodic inspection program or at the roadside as part of a random roadside inspection program.

§396.21 Periodic inspection recordkeeping requirements.

(a) The qualified inspector performing the inspection shall prepare a report that:

(1) Identifies the individual performing the inspection;

(2) Identifies the motor carrier operating the vehicle or intermodal equipment provider intending to interchange the vehicle to a motor carrier;

(3) Identifies the date of the inspection;

(4) Identifies the vehicle inspected;

(5) Identifies the vehicle components inspected and describes the results of the inspection, including the identification of those components not meeting the minimum standards set forth in appendix G to this subchapter; and

(6) Certifies the accuracy and completeness of the inspection as complying with all the requirements of this section.

(b)(1) The original or a copy of the inspection report shall be retained by the motor carrier, intermodal equipment provider, or other entity that is responsible for the inspection for a period of fourteen months from the date of the inspection report. The original or a copy of the

inspection report must be retained where the vehicle is either housed or maintained.

(2) The original or a copy of the inspection report must be available for inspection upon demand of an authorized Federal, State or local official.

(3) **Exception.** If the motor carrier operating the commercial motor vehicles did not perform the commercial motor vehicle's last annual inspection, or if an intermodal equipment provider did not itself perform the annual inspection on equipment intended for interchange to a motor carrier, the motor carrier or intermodal equipment provider is responsible for obtaining the original or a copy of the last annual inspection report upon demand of an authorized Federal, State, or local official.

§396.23 Equivalent to periodic inspection.

(a) A motor carrier or an intermodal equipment provider may meet the requirements of §396.17 through a State or other jurisdiction's roadside inspection program. The inspection must have been performed during the preceding 12 months. In using the roadside inspection, the motor carrier or intermodal equipment provider would need to retain a copy of an annual inspection report showing that the inspection was performed in accordance with the minimum periodic inspection standards set forth in appendix G to this subchapter. If the motor carrier operating the commercial vehicle is not the party directly responsible for its maintenance, the motor carrier must deliver the roadside inspection report to the responsible party in a timely manner. Before accepting such an inspection report, the motor carrier or intermodal equipment provider must ensure that the report complies with the requirements of §396.21(a).

(b)(1) If a commercial motor vehicle is subject to a mandatory State inspection program which is determined by the Administrator to be as effective as §396.17, the motor carrier or intermodal equipment provider must meet the requirement of §396.17 through that State's inspection program. Commercial motor vehicle inspections may be conducted by State personnel, at State authorized commercial facilities, or by the motor carrier or intermodal equipment provider itself under the auspices of a State authorized self-inspection program.

(2) Should the FMCSA determine that a State inspection program, in whole or in part, is not as effective as §396.17, the motor carrier or intermodal equipment provider must ensure that the periodic inspection required by §396.17 is performed on all commercial motor vehicles under its control in a manner specified in §396.17.

§396.25 Qualifications of brake inspectors.

(a) Motor carriers and intermodal equipment providers must ensure that all inspections, maintenance, repairs or service to the brakes of its commercial motor vehicles, are performed in compliance with the requirements of this section.

(b) For purposes of this section, *brake inspector* means any employee of a motor carrier or intermodal equipment provider who is responsible for ensuring that all brake inspections, maintenance, service, or repairs to

Vehicle Maintenance Pro

any commercial motor vehicle, subject to the motor carrier's or intermodal equipment provider's control, meet the applicable Federal standards.

(c) No motor carrier or intermodal equipment provider may require or permit any employee who does not meet the minimum brake inspector qualifications of paragraph (d) of this section to be responsible for the inspection, maintenance, service or repairs of any brakes on its commercial motor vehicles.

(d) The motor carrier or intermodal equipment provider must ensure that each brake inspector is qualified as follows:

(1) Understands the brake service or inspection task to be accomplished and can perform that task; and

(2) Is knowledgeable of and has mastered the methods, procedures, tools and equipment used when performing an assigned brake service or inspection task; and

(3) Is capable of performing the assigned brake service or inspection by reason of experience, training, or both as follows:

(i) Has successfully completed an apprenticeship program sponsored by a State, a Canadian Province, a Federal agency or a labor union, or a training program approved by a State, Provincial or Federal agency, or has a certificate from a State or Canadian Province that qualifies the person to perform the assigned brake service or inspection task (including passage of Commercial Driver's License air brake tests in the case of a brake inspection); or

(ii) Has brake-related training or experience or a combination thereof totaling at least one year. Such training or experience may consist of:

(A) Participation in a training program sponsored by a brake or vehicle manufacturer or similar commercial training program designed to train students in brake maintenance or inspection similar to the assigned brake service or inspection tasks; or

(B) Experience performing brake maintenance or inspection similar to the assigned brake service or inspection task in a motor carrier or intermodal equipment provider maintenance program; or

(C) Experience performing brake maintenance or inspection similar to the assigned brake service or inspection task at a commercial garage, fleet leasing company, or similar facility.

(e) No motor carrier or intermodal equipment provider may employ any person as a brake inspector unless the evidence of the inspector's qualifications, required under this section, is maintained by the motor carrier or intermodal equipment provider at its principal place of business, or at the location at which the brake inspector is employed. The evidence must be maintained for the period during which the brake inspector is employed in that capacity and for one year thereafter. However, motor carriers and intermodal equipment providers do not have to maintain evidence of qualifications to inspect air brake systems for such inspections performed by persons who have passed the air brake knowledge and skills test for a Commercial Driver's License.

Interpretations to Part 396 — Inspection, repair, and maintenance

Sections Interpreted

396.3	Inspection, Repair, and Maintenance
396.9	Inspection of Motor Vehicles in Operation
396.11	Driver Vehicle Inspection Report(s)
396.13	Driver Inspection
396.17	Periodic Inspection
396.19	Inspector Qualifications
396.21	Periodic Inspection Recordkeeping Requirements
396.23	Equivalent to a Periodic Inspection
396.25	Qualifications of Brake Inspectors

§396.3 Inspection, Repair, and Maintenance

Question 1: What is meant by “systematic inspection, repair, and maintenance”?

Guidance: Generally, systematic means a regular or scheduled program to keep vehicles in a safe operating condition. §396.3 does not specify inspection, maintenance, or repair intervals because such intervals are fleet specific and, in some instances, vehicle specific. The inspection, repair, and maintenance intervals are to be determined by the motor carrier. The requirements of §§396.11, 396.13, and 396.17 are in addition to the systematic inspection, repair, and maintenance required by §396.3.

Question 2: 396.3(b)(4) refers to a record of tests. What tests are required of push-out windows and emergency door lamps on buses?

Guidance: Generally, inspection of a push-out window would require pushing out the window. However, if the window may be destroyed by pushing out to test its proper functioning, a visual inspection may qualify as a test if the inspector can ascertain the proper functioning of the window without opening it. Checking to ensure that the rubber push-out molding is properly in place and has not deteriorated and that any handles or marking instructions have not been tampered with would meet the test requirement. Inspection of emergency door marking lights would require opening the door to test the lights.

Question 3: Who has the responsibility of inspecting and maintaining leased vehicles and their maintenance records?

Guidance: The motor carrier must either inspect, repair, maintain, and keep suitable records for all vehicles subject to its control for 30 consecutive days or more, or cause another party to perform such activities. The motor carrier is solely responsible for ensuring that the vehicles under its control are in safe operating condition and that defects have been corrected.

Question 4: Is computerized recordkeeping of CMV inspection and maintenance information permissible under §396.3 of the FMCSRs?

Guidance: Yes, if the minimum inspection, repair, and maintenance records required are included in the computer information system and can be reproduced on demand.

Question 5: Where must vehicle inspection and maintenance records be retained if a vehicle is not housed or maintained at a single location?

Guidance: The motor carrier may retain the records at a location of its choice. If the vehicle maintenance records are retained at a location apart from the vehicle, the motor carrier is not relieved of its responsibility for ensuring that the records

Notes

Vehicle Maintenance Pro

Notes

are current and factual. In all cases, however, upon request of the FHWA the maintenance records must be made available within a reasonable period of time (2 working days).

§396.9 Inspection of Motor Vehicles in Operation

Question 1: Under what conditions may a vehicle that has been placed “out of service” under §396.3 be moved?

Guidance: The vehicle may be moved by being placed entirely upon another vehicle, towed by a vehicle equipped with a crane or hoist, or driven if the “out of service” condition no longer exists.

Question 2: Is it the intent of §396.9 to allow “out of service” vehicles to be towed?

Guidance: Yes; however, not all out of service vehicles may be towed away from the inspection location. The regulation sets up a flexible situation that will permit the inspecting officer to use his/her best judgment on a case-by-case basis.

§396.11 Driver Vehicle Inspection Report(s)

Question 1: Does §396.11 require the DVIR to be turned in each day by a driver dispatched on a trip of more than one day’s duration?

Guidance: A driver must prepare a DVIR at the completion of each day’s work and shall submit those reports to the motor carrier upon his/her return to the home terminal. This does not relieve the motor carrier from the responsibility of effecting repairs and certification of any items listed on the DVIR, prepared at the end of each day’s work, that would be likely to affect the safety of the operation of the motor vehicle.

Question 2: Does §396.11 require that the power unit and the trailer be inspected?

Guidance: Yes. A driver must be satisfied that both the power unit and the trailer are in safe operating condition before operating the combination.

Question 3: May more than one power unit be included on the DVIR if two or more power units were used by a driver during one day’s work?

Guidance: No. A separate DVIR must be prepared for each power unit operated during the day’s work.

Question 4: Does §396.11 require a motor carrier to use a specific type of DVIR?

Guidance: A motor carrier may use any type of DVIR as long as the report contains the information and signatures required.

Question 5: Does §396.11 require a separate DVIR for each vehicle and a combination of vehicles or is one report adequate to cover the entire combination?

Guidance: One vehicle inspection report may be used for any combination, provided the defects or deficiencies, if any, are identified for each vehicle and the driver signs the report.

Question 6: Does §396.11(c) require a motor carrier to effect repairs of all items listed on a DVIR prepared by a driver before the vehicle is subsequently driven?

Guidance: The motor carrier must effect repairs of defective or missing parts and accessories listed in Appendix G to the FMCSRs before allowing the vehicle to be driven.

Question 7: What constitutes a “certification” as required by §396.11(c)(1) and (2)?

Regulations

Guidance: A motor carrier or its agent must state, in writing, that certain defects or deficiencies have been corrected or that correction was unnecessary. The declaration must be immediately followed by the signature of the person making it.

Question 8: Who must certify under §396.11(c) that repairs have been made when a motor vehicle is repaired en route by the driver or a commercial repair facility?

Guidance: Either the driver or the commercial repair facility.

Question 9: Must certification for trailer repairs be made?

Guidance: Yes. Certification must be made that all reported defects or deficiencies have been corrected or that correction was unnecessary. The certification need only appear on the carrier's copy of the report if the trailer is separated from the tractor.

Question 10: What responsibility does a vehicle leasing company, engaged in the daily rental of CMVs, have regarding the placement of the DVIR in the power unit?

Guidance: A leasing company has no responsibility to comply with §396.11 unless it is the carrier. It is the responsibility of a motor carrier to comply with part 396 regardless of whether the vehicles are owned or leased.

Question 11: Which carrier is to be provided the original of the DVIR in a trip lease arrangement?

Guidance: The motor carrier controlling the vehicle during the term of the lease (i.e. the lessee) must be given the original of the DVIR. The controlling motor carrier is also responsible for obtaining and retaining records relating to repairs.

Question 12: Must the motor carrier's certification be shown on all copies of the DVIR?

Guidance: Yes.

Question 13: Must a DVIR carried on a power unit during operation cover both the power unit and trailer being operated at the time?

Guidance: No. The DVIR must cover the power unit being operated at the time. The trailer identified on there port may represent one pulled on the preceding trip.

Question 14: In instances where the DVIR has not been prepared or cannot be located, is it permissible under §396.11 for a driver to prepare a DVIR based on a pretrip inspection and a short drive of a motor vehicle?

Guidance: Yes. §396.11 of the FMCSRs places the responsibility on the motor carrier to require its drivers to prepare and submit the DVIR. If, in unusual circumstances, the DVIR has not been prepared or cannot be located the motor carrier may cause a road test and inspection to be performed for safety of operation and the DVIR to be prepared.

Question 15: Is it permissible to use the back of a record of duty status (daily log) as a DVIR?

Guidance: Yes, but the retention requirements of §396.11 and §395.8 must be met.

Question 16: Does §396.11 require that specific parts and accessories that are inspected be identified on the DVIR?

Guidance: No.

Notes

Vehicle Maintenance Pro

Notes

Question 17: Is the Ontario pretrip/posttrip inspection report acceptable as a DVIR under §396.11?

Guidance: Yes, provided the report from the preceding trip is carried on board the motor vehicle while in operation and all entries required by §396.11 and 396.13 are contained on the reports.

Question 18: Where must DVIRs be maintained?

Guidance: Since §396.11 is not specific, the DVIRs may be kept at either the motor carrier's principal place of business or the location where the vehicle is housed or maintained.

Question 19: Who is responsible for retaining DVIRs for leased vehicles including those of owner-operators?

Guidance: The motor carrier is responsible for retaining the original copy of each DVIR and the certification of repairs for at least 3 months from the date the report was prepared.

Question 20: Is a multi-day DVIR acceptable under §396.11 and 396.13?

Guidance: Yes, provided all information and certifications required by §§396.11 and 396.13 are contained on the report.

Question 21: Is a DVIR required by a motor carrier operating only one tractor trailer combination?

Guidance: No. One tractor semitrailer/full trailer combination is considered one motor vehicle. However, a carrier operating a single truck tractor and multiple semitrailers, which are not capable of being operated as one combination unit, would be required to prepare DVIRs.

Question 22: Are motor carriers required to retain the "legible copy" of the last vehicle inspection report (referenced in §396.11(c)(3)) which is carried on the power unit?

Guidance: No. The record retention requirement refers only to the original copy retained by the motor carrier.

Question 23: Does the record retention requirement of §396.11(c)(2) apply to all DVIRs, or only those reports on which defects or deficiencies have been noted?

Guidance: The record retention requirement applies to all DVIRs.

Question 24: How would the DVIR requirements apply to a driver who works two or more shifts in a single calendar day?

Guidance: Section 396.11(a) requires every driver to prepare a DVIR at the completion of each day's work on each vehicle operated. A driver who operates two or more vehicles in a 24-hour-period must prepare a DVIR at the completion of the tour of duty in each vehicle.

Question 25: Section 396.11 requires the driver, at the completion of each day's work, to prepare a written report on each vehicle operated that day. Does this section require a "post trip inspection" of the kind described in §396.15?

Guidance: No. However, the written report must include all defects in the parts and accessories listed in §396.11(a) that were discovered by or reported to the driver during that day.

Question 26: Is the motor carrier official or agent who certifies that defects or deficiencies have been corrected or that correction was unnecessary required to be a mechanic or have training concerning commercial motor vehicle maintenance?

Regulations

Guidance: No. Section 396.11 does not establish minimum qualifications for motor carrier officials or agents who certify that defects or deficiencies on DVIRs are corrected. With the exception of individuals performing the periodic or annual inspection (§396.19), and motor carrier employees responsible for ensuring that brake-related inspection, repair, or maintenance tasks are performed correctly (§396.25), Part 396 of the FMCSRs does not establish minimum qualifications for maintenance personnel. Motor carriers, therefore, are not prohibited from having DVIRs certified by company officials or agents who do not have experience repairing or maintaining commercial motor vehicles.

§396.13 Driver Inspection

Question 1: If a DVIR does not indicate that certain defects have been repaired, and the motor carrier has not certified in writing that such repairs were considered unnecessary, may the driver refuse to operate the motor vehicle?

Guidance: The driver is prohibited from operating the motor vehicle if the motor carrier fails to make that certification. Operation of the vehicle by the driver would cause the driver and the motor carrier to be in violation of §396.11(c) and both would be subject to appropriate penalties. However, a driver may sign the certification of repairs as an agent of the motor carrier if he/she is satisfied that the repairs have been performed.

Question 2: At the end of the day's work and upon completion of the required DVIR, what does the driver do with the copy of the previous DVIR carried on the power unit?

Guidance: There is no requirement that the driver submit the copy of that previous DVIR to the motor carrier nor is there a retention requirement for the motor carrier.

§396.17 Periodic Inspection

Question 1: Some of a motor carrier's vehicles are registered in a State with a mandated inspection program which has been determined to be as effective as the Federal periodic inspection program, but these vehicles are not used in that State. Is the motor carrier required to make sure the vehicles are inspected under that State's program in order to meet the Federal periodic inspection requirements?

Guidance: If the State requires all vehicles registered in the State to be inspected through its mandatory program then the motor carrier must go through the State program to satisfy the Federal requirements. If, however, the State inspection program includes an exception or exemption for vehicles which are registered in the State but domiciled outside of the State, then the motor carrier may meet the Federal requirements through a self-inspection, a third party inspection, a CVSA inspection, or a periodic inspection performed in any State with a program that the FHWA determines is comparable to, or as effective as, the part 396 requirements.

Question 2: May the due date for the next inspection satisfy the requirements for the inspection date on the sticker or decal?

Guidance: No. The rule requires that the date of the inspection be included on the report and sticker or decal. This date may consist of a month and a year.

Question 3: Must each vehicle in a combination carry separate periodic inspection documentation?

Guidance: Yes, unless a single document clearly identifies all of the vehicles in the CMV combination.

Notes

Vehicle Maintenance Pro

Notes

Question 4: Does the sticker have to be located in a specific location on the vehicle?

Guidance: No. The rule does not specify where the sticker, decal or other form of documentation must be located. It is the responsibility of the driver to produce the documentation when requested. Therefore, the driver must know the location of the sticker and ensure that all information on it is legible and current. The driver must also be able to produce the inspection report if that form of documentation is used.

Question 5: Is new equipment required to pass a periodic inspection under §396.17?

Guidance: Yes, but a dealer who meets the inspection requirements may provide the documentation for the initial periodic inspection.

Question 6: Are the Federal periodic inspection requirements applicable to U.S. Government trailers operated by motor carriers engaged in interstate commerce?

Guidance: Yes. The transportation is not performed by a governmental entity but by a for-hire carrier in interstate commerce.

Question 7: Does a CMV equipped with tires marked “Not for Highway Use” meet the periodic inspection requirements?

Guidance: No. Appendix G to subchapter B—Minimum Periodic Inspection Standards, lists tires so labeled as a defect or deficiency which would prevent a vehicle from passing an inspection.

Question 8: Is a CMV subject to a road side inspection by State or Federal inspectors if it displays a periodic inspection decal or other evidence of a periodic inspection being conducted in the past 12 months?

Guidance: Yes. Evidence of a valid periodic inspection only precludes a citation for a violation of §396.17.

Question 9: Is a State required to accept the periodic inspection program of another State having a periodic inspection program meeting minimum FHWA standards as contained in appendix G to the FMCSRs?

Guidance: Yes. Section 210 of the MCSA (49 U.S.C. 31142) establishes the principle that State inspections meeting federally approved criteria must be recognized by every other State.

Question 10: Do vehicles inspected under a periodic Canadian inspection program comply with the FHWA periodic inspection standards?

Guidance: Yes. The FHWA has determined that the inspection programs of all of the Canadian Provinces meet or exceed the Federal requirements for a periodic inspection program.

Question 11: Must a specific form be used to record the periodic inspection mandated by §396.17?

Guidance: No. Section 396.21 does not designate any particular form, decal, or sticker, but does specify the information which must be shown on these documents.

Question 12: May an inspector certify a CMV as meeting the periodic inspection standards of §396.17 if he/she cannot see all components required to be inspected under appendix G?

Regulations

Guidance: No. The affixing of a decal or sticker or preparation of a report as proof of inspection indicates compliance with all requirements of appendix G to part 396.

Question 13: If an inter modal container is attached to a chassis at the time of a periodic inspection, must the container also be inspected to comply with §396.17 inspection requirements?

Guidance: Yes. Safe loading is one of the inspection areas covered under appendix G. If the chassis is loaded at the time of inspection, the method of securement of the container to the chassis must be included in the inspection. Although integral securement devices such as twist locks are not listed in appendix G, the operation of these devices must be included in the inspection without removal of the container.

Question 14: Is it acceptable for the proof of periodic inspection to be written in Spanish?

Guidance: Yes. There is no requirement under §396.17, or appendix G to subchapter B that the proof of periodic inspection be written in English.

§396.19 Inspector Qualifications

Question 1: May an entity other than a motor carrier maintain the evidence of inspector qualifications required by §396.19(b)?

Guidance: Yes. In those cases in which the inspection is performed by a commercial garage or similar facility or a leasing company, the motor carrier may allow the commercial garage or leasing company to maintain a copy of the inspector's qualifications on behalf of the motor carrier. The motor carrier, however, is responsible for obtaining copies of evidence of the inspector's qualifications upon the request of Federal, State, or local officials. If, for whatever reason, the motor carrier is unable to obtain this information from the third party, the motor carrier may be cited for noncompliance with §396.19.

Question 2: Is there a specific form or format to be used in ensuring that inspectors are qualified in accordance with §396.19?

Guidance: No. Section 396.19(b) requires the motor carrier to retain evidence satisfying the standards without specifying any particular form.

§396.21 Periodic Inspection Recordkeeping Requirements

Question 1: What recordkeeping requirements under §396.21 is a carrier subject to when it utilizes an FHWA-approved State inspection program?

Guidance: The motor carrier must comply with the record-keeping requirements of the State. The requirements specified in §396.21 (a) and (b) are applicable only in those instances where the motor carrier self-inspects its CMVs or has an agent perform the periodic inspection.

§396.23 Equivalent to a Periodic Inspection

Question 1: Is a CVSA Level I or Level V inspection a "State * * * roadside inspection program" through which a motor carrier may meet the periodic inspection requirements of §396.17? If so, what evidence of inspection is required?

Guidance: A CVSA Level I or Level V inspection is equivalent to the Federal periodic inspection requirements. A CMV that passes such an inspection has therefore met §396.17, unless the vehicle is subject to a mandatory State inspection program that the FHWA has determined is comparable to, or as effective as, the Federal requirements [see §396.23(b)(1)]. A CVSA decal displayed on the

Notes

Vehicle Maintenance Pro

Notes

CMV, or a copy of the Level I or Level V inspection report maintained in the vehicle, constitutes sufficient evidence of inspection.

§396.25 Qualifications of Brake Inspectors

Question 1: Does a CDL with an airbrake endorsement qualify a person as a brake inspector under §396.25?

Guidance: No.

Question 2: May a driver who does not have the necessary experience perform the adjustment under directions issued by telephone by a qualified inspector?

Guidance: Yes. A driver is permitted to perform brake adjustments at a roadside inspection providing they are done under the supervision of a qualified brake adjuster and the carrier is willing to assume responsibility for the proper adjustment.

Question 3: May a driver or other motor carrier employee be qualified as a brake inspector under §396.25 by way of experience or training to perform brake adjustments without being qualified to perform other brake-related tasks such as the repair or replacement of brake components?

Guidance: Yes. A driver may be qualified by the motor carrier to perform a limited number of tasks in connection with the brake system, e.g., inspect and/or adjust the vehicle's brakes, but not repair them.

Question 4: Would a mechanic who is employed by a leasing company and only works on CMVs that the leasing company leases to other motor carriers be required to meet the brake inspector certification requirements?

Guidance: No. The mechanic is not required to meet the certification requirements of §396.25(d) since he/she is not employed by a motor carrier.

Regulations

Appendix G to Subchapter B of Chapter III—Minimum Periodic Inspection Standards

A vehicle does not pass an inspection if it has one of the following defects or deficiencies:

1. Brake System.

a. Service Brakes.

(1) Absence of braking action on any axle required to have brakes upon application of the service brakes (such as missing brakes or brake shoe(s) failing to move upon application of a wedge. S-cam, cam, or disc brake).

(2) Missing or broken mechanical components including: shoes, lining pads, springs, anchor pins, spiders, cam rollers, push-rods, and air chamber mounting bolts.

(3) Loose brake components including air chambers, spiders, and cam shaft support brackets.

(4) Audible air leak at brake chamber (Example-ruptured diaphragm, loose chamber clamp, etc.).

(5) Readjustment limits.

(a) The maximum pushrod stroke must not be greater than the values given in the tables below and at §393.47(e). Any brake stroke exceeding the readjustment limit will be rejected. Stroke must be measured with engine off and reservoir pressure of 80 to 90 psi with brakes fully applied.

CLAMP-TYPE BRAKE CHAMBERS

Type	Outside diameter	Brake readjustment limit: standard stroke chamber	Brake readjustment limit: long stroke chamber
6.....	4 1/2 in. (114 mm)	1 1/4 in. (31.8 mm).	
9.....	5 1/4 in. (133 mm)	1 3/8 in. (34.9 mm).	
12.....	5 11/16 in. (145 mm)	1 3/8 in. (34.9 mm)	1 3/4 in. (44.5 mm).
16.....	6 3/8 in. (162 mm)	1 3/4 in. (44.5 mm)	2 in. (50.8 mm).
20.....	6 25/32 in. (172 mm)	1 3/4 in. (44.5 mm)	2 in. (50.8 mm). 2 1/2 in. (63.5 mm). ¹
24.....	7 7/32 in. (184 mm)	1 3/4 in. (44.5 mm)	2 in. (50.8 mm). 2 1/2 in. (63.5 mm). ²
30.....	8 3/32 in. (206 mm)	2 in. (50.8 mm)	2 1/2 in. (63.5 mm).
36.....	9 in. (229 mm)	2 1/4 in. (57.2 mm).	

¹ For type 20 chambers with a 3-inch (76 mm) rated stroke.

² For type 24 chambers with a 3-inch (76 mm) rated stroke.

BENDIX DD-3 BRAKE CHAMBERS

Type	Outside diameter	Brake readjustment limit
30.....	8 1/8 in. (206 mm)	2 1/4 in. (57.2 mm).

BOLT-TYPE BRAKE CHAMBERS

Type	Outside diameter	Brake readjustment limit
A.....	6 15/16 in. (176 mm)	1 3/8 in. (34.9 mm).
B.....	9 3/16 in. (234 mm)	1 3/4 in. (44.5 mm).
C.....	8 1/16 in. (205 mm)	1 3/4 in. (44.5 mm).
D.....	5 1/4 in. (133 mm)	1 1/4 in. (31.8 mm).
E.....	6 3/16 in. (157 mm)	1 3/8 in. (34.9 mm).
F.....	11 in. (279 mm)	2 1/4 in. (57.2 mm).
G.....	9 7/8 in. (251 mm)	2 in. (50.8 mm).

ROTOCHAMBER-TYPE BRAKE CHAMBERS

Type	Outside diameter	Brake readjustment limit
9.....	4 9/32 in. (109 mm)	1 1/2 in. (38.1 mm).

ROTOCHAMBER-TYPE BRAKE CHAMBERS, Continued

Type	Outside diameter	Brake readjustment limit
12.....	4 13/16 in. (122 mm)	1 1/2 in. (38.1 mm).
16.....	5 13/32 in. (138 mm)	2 in. (50.8 mm).
20.....	5 15/16 in. (151 mm)	2 in. (50.8 mm).
24.....	6 13/32 in. (163 mm)	2 in. (50.8 mm).
30.....	7 1/16 in. (180 mm)	2 1/4 in. (57.2 mm).
36.....	7 5/8 in. (194 mm)	2 3/4 in. (69.9 mm).
50.....	8 7/8 in. (226 mm)	3 in. (76.2 mm).

(b) For actuator types not listed in these tables, the pushrod stroke must not be greater than 80 percent of the rated stroke marked on the actuator by the actuator manufacturer, or greater than the readjustment limit marked on the actuator by the actuator manufacturer.

(6) Brake linings or pads.

(a) Lining or pad is not firmly attached to the shoe;

(b) Saturated with oil, grease, or brake fluid; or

(c) Non-steering axles: Lining with a thickness less than 1/4 inch at the shoe center for air drum brakes, 1/16 inch or less at the shoe center for hydraulic and electric drum brakes, and less than 1/8 inch for air disc brakes.

(d) Steering axles: Lining with a thickness less than 1/4 inch at the shoe center for drum brakes, less than 1/8 inch for air disc brakes and 1/16 inch or less for hydraulic disc and electric brakes.

(7) Missing brake on any axle required to have brakes.

(8) Mismatch across any power unit steering axle of:

(a) Air chamber sizes.

(b) Slack adjuster length.

Wedge Brake Data—Movement of the scribe mark on the lining shall not exceed 1/16 inch.

b. **Parking Brake System.** No brakes on the vehicle or combination are applied upon actuation of the parking brake control, including driveline hand controlled parking brakes.

c. Brake Drum or Rotors.

(1) With any external crack or cracks that open upon brake application (do not confuse short hairline heat check cracks with flexural cracks).

(2) Any portion of the drum or rotor missing or in danger of falling away.

d. Brake Hose.

(1) Hose with any damage extending through the outer reinforcement ply. (Rubber impregnated fabric cover is not a reinforcement ply). (Thermoplastic nylon may have braid reinforcement or color difference between cover and inner tube. Exposure of second color is cause for rejection.

(2) Bulge or swelling when air pressure is applied.

(3) Any audible leaks.

(4) Two hoses improperly joined (such as a splice made by sliding the hose ends over a piece of tubing and clamping the hose to the tube).

(5) Air hose cracked, broken or crimped.

e. Brake Tubing.

(1) Any audible leak.

(2) Tubing cracked, damaged by heat, broken or crimped.

f. **Low Pressure Warning Device** missing, inoperative, or does not operate at 55 psi and below, or 1/2 the governor cut-out pressure, whichever is less.

Vehicle Maintenance Pro

g. **Tractor Protection Valve.** Inoperable or missing tractor protection valve(s) on power unit.

h. **Air Compressor.**

(1) Compressor drive belts in condition of impending or probable failure.

(2) Loose compressor mounting bolts.

(3) Cracked, broken or loose pulley.

(4) Cracked or broken mounting brackets, braces or adapters.

i. **Electric Brakes.**

(1) Absence of braking action on any wheel required to have brakes.

(2) Missing or inoperable breakaway braking device.

j. **Hydraulic Brakes. (Including Power Assist Over Hydraulic and Engine Drive Hydraulic Booster).**

(1) Master cylinder less than $\frac{1}{4}$ full.

(2) No pedal reserve with engine running except by pumping pedal.

(3) Power assist unit fails to operate.

(4) Seeping or swelling brake hose(s) under application of pressure.

(5) Missing or inoperative check valve.

(6) Has any visually observed leaking hydraulic fluid in the brake system.

(7) Has hydraulic hose(s) abraded (chafed) through outer cover-to-fabric layer.

(8) Fluid lines or connections leaking restricted, crimped, cracked or broken.

(9) Brake failure or low fluid warning light on and/or inoperative.

k. **Vacuum Systems.** Any vacuum system which:

(1) Has insufficient vacuum reserve to permit one full brake application after engine is shut off.

(2) Has vacuum hose(s) or line(s) restricted, abraded (chafed) through outer cover to cord ply, crimped, cracked, broken or has collapse of vacuum hose(s) when vacuum is applied.

(3) Lacks an operative low-vacuum warning device as required.

2. **Coupling Devices.**

a. **Fifth Wheels.**

(1) Mounting to frame.

(a) Any fasteners missing or ineffective.

(b) Any movement between mounting components.

(c) Any mounting angle iron cracked or broken.

(2) Mounting plates and pivot brackets.

(a) Any fasteners missing or ineffective.

(b) Any welds or parent metal cracked.

(c) More than $\frac{3}{8}$ inch horizontal movement between pivot bracket pin and bracket.

(d) Pivot bracket pin missing or not secured.

(3) Sliders.

(a) Any latching fasteners missing or ineffective.

(b) Any fore or aft stop missing or not securely attached.

(c) Movement more than $\frac{3}{8}$ inch between slider bracket and slider base.

(d) Any slider component cracked in parent metal or weld.

(4) Lower coupler.

(a) Horizontal movement between the upper and lower fifth wheel halves exceeds $\frac{1}{2}$ inch.

(b) Operating handle not in closed or locked position.

(c) Kingpin not properly engaged.

(d) Separation between upper and lower coupler allowing light to show through from side to side.

(e) Cracks in the fifth wheel plate.

Exceptions: Cracks in fifth wheel approach ramps and casting shrinkage cracks in the ribs of the body of a cast fifth wheel.

(f) Locking mechanism parts missing, broken, or deformed to the extent the kingpin is not securely held.

b. **Pintle Hooks.**

(1) Mounting to frame.

(a) Any missing or ineffective fasteners (a fastener is not considered missing if there is an empty hole in the device but no corresponding hole in the frame or vice versa).

(b) Mounting surface cracks extending from point of attachment (e.g., cracks in the frame at mounting bolt holes).

(c) Loose mounting.

(d) Frame crossmember providing pintle hook attachment cracked.

(2) Integrity.

(a) Cracks anywhere in pintle hook assembly.

(b) Any welded repairs to the pintle hook.

(c) Any part of the horn section reduced by more than 20%.

(d) Latch insecure.

c. **Drawbar/Towbar Eye.**

(1) Mounting.

(a) Any cracks in attachment welds.

(b) Any missing or ineffective fasteners.

(2) Integrity.

(a) Any cracks.

(b) Any part of the eye reduced by more than 20%.

d. **Drawbar/Towbar Tongue..**

(1) Slider (power or manual).

(a) Ineffective latching mechanism.

(b) Missing or ineffective stop.

(c) Movement of more than $\frac{1}{4}$ inch between slider and housing.

(d) Any leaking, air or hydraulic cylinders, hoses, or chambers (other than slight oil weeping normal with hydraulic seals).

(2) Integrity.

(a) Any cracks.

(b) Movement of $\frac{1}{4}$ inch between subframe and drawbar at point of attachment.

e. **Safety Devices.**

(1) Safety devices missing.

(2) Unattached or incapable of secure attachment.

(3) Chains and hooks.

(a) Worn to the extent of a measurable reduction in link cross section.

(b) Improper repairs including welding, wire, small bolts, rope and tape.

(4) Cable.

(a) Kinked or broken cable strands.

(b) Improper clamps or clamping.

f. **Saddle-Mounts.**

(1) Method of attachment.

Regulations

- (a) Any missing or ineffective fasteners.
- (b) Loose mountings.
- (c) Any cracks or breaks in a stress or load bearing member.
- (d) Horizontal movement between upper and lower saddle-mount halves exceeds $\frac{1}{4}$ inch.

3. Exhaust System.

- a. Any exhaust system determined to be leaking at a point forward of or directly below the driver/sleeper compartment.
- b. A bus exhaust system leaking or discharging to the atmosphere:

(1) **Gasoline powered**—excess of 6 inches forward of the rearmost part of the bus.

(2) **Other than gasoline powered**—in excess of 15 inches forward of the rearmost part of the bus.

(3) **Other than gasoline powered**—forward of a door or window designed to be opened. (Exception: emergency exits).

c. No part of the exhaust system of any motor vehicle shall be so located as would be likely to result in burning, charring, or damaging the electrical wiring, the fuel supply, or any combustible part of the motor vehicle.

4. Fuel System.

- a. A fuel system with a visible leak at any point.
- b. A fuel tank filler cap missing.
- c. A fuel tank not securely attached to the motor vehicle by reason of loose, broken or missing mounting bolts or brackets (some fuel tanks use springs or rubber bushings to permit movement).

5. Lighting Devices.

All lighting devices and reflectors required by part 393 shall be operable.

6. Safe loading.

- a. Part(s) of vehicle or condition of loading such that the spare tire or any part of the load or dunnage can fall onto the roadway.
- b. Protection Against Shifting Cargo—Any vehicle without a front-end structure or equivalent device as required.
- c. Container securement devices on intermodal equipment—All devices used to secure an intermodal container to a chassis, including rails or support frames, tiedown bolsters, locking pins, clevises, clamps, and hooks that are cracked, broken, loose, or missing.

7. Steering Mechanism

a. **Steering Wheel Free Play** (on vehicles equipped with power steering the engine must be running).

Steering wheel diameter	Manual steering system	Power steering system
16"	2"	4 $\frac{1}{2}$ "
18"	2 $\frac{1}{4}$ "	4 $\frac{3}{4}$ "
20"	2 $\frac{1}{2}$ "	5 $\frac{1}{4}$ "
22"	2 $\frac{3}{4}$ "	5 $\frac{3}{4}$ "

b. Steering Column.

- (1) Any absence or looseness of U-bolt(s) or positioning part(s).
- (2) Worn, faulty or obviously repair welded universal joint(s).
- (3) Steering wheel not properly secured.

c. Front Axle Beam and All Steering Components Other Than Steering Column.

- (1) Any crack(s).
- (2) Any obvious welded repair(s).

d. Steering Gear Box.

- (1) Any mounting bolt(s) loose or missing.
- (2) Any crack(s) in gear box or mounting brackets.

e. **Pitman Arm.** Any looseness of the pitman arm on the steering gear output shaft.

f. **Power Steering.** Auxiliary power assist cylinder loose.

g. Ball and Socket Joints.

- (1) Any movement under steering load of a stud nut.
- (2) Any motion, other than rotational, between any linkage member and it's attachment point of more than $\frac{1}{4}$ inch.

h. Tie Rods and Drag Links.

- (1) Loose clamp(s) or clamp bolt(s) on tie rods or drag links.
- (2) Any looseness in any threaded joint.

i. **Nuts.** Nut(s) loose or missing on tie rods pitman arm, drag link, steering arm or tie rod arm.

j. **Steering System.** Any modification or other condition that interferes with free movement of any steering component.

8. Suspension.

a. Any U-bolt(s), spring hanger(s), or other axle positioning part(s) cracked, broken, loose or missing resulting in shifting of an axle from its normal position. (After a turn, lateral axle displacement is normal with some suspensions. Forward or rearward operation in a straight line will cause the axle to return to alignment).

b. Spring Assembly.

- (1) Any leaves in a leaf spring assembly broken or missing.
- (2) Any broken main leaf in a leaf spring assembly. (Includes assembly with more than one main spring).
- (3) Coil spring broken.
- (4) Rubber spring missing.
- (5) One or more leaves displaced in a manner that could result in contact with a tire, rim, brake drum or frame.
- (6) Broken torsion bar spring in a torsion bar suspension.
- (7) Deflated air suspension, i.e., system failure, leak, etc.

c. Torque, Radius or Tracking Components.

Any part of a torque, radius or tracking component assembly or any part used for attaching the same to the vehicle frame or axle that is cracked, loose, broken or missing. (Does not apply to loose bushings in torque or track rods.)

9. Frame.

a. Frame Members.

- (1) Any cracked, broken, loose, or sagging frame member.
- (2) Any loose or missing fasteners including fasteners attaching functional component such as engine, transmission, steering gear, suspension, body parts, and fifth wheel.

b. **Tire and Wheel Clearance.** Any condition, including loading, that causes the body or frame to be in contact with a tire or any part of the wheel assemblies.

c. (1) **Adjustable Axle Assemblies (Sliding Subframes).** Adjustable axle assembly with locking pins missing or not engaged.

10. Tires.

a. Any tire on any steering axle of a power unit.

- (1) With less than $\frac{4}{32}$ inch tread when measured at any point on a major tread groove.
- (2) Has body ply or belt material exposed through the tread or sidewall.

Vehicle Maintenance Pro

- (3) Has any tread or sidewall separation.
- (4) Has a cut where the ply or belt material is exposed.
- (5) Labeled "Not for Highway Use" or displaying other marking which would exclude use on steering axle.
- (6) A tube-type radial tire without radial tube stem markings. These markings include a red band around the tube stem, the word "radial" embossed in metal stems, or the word "radial" molded in rubber stems.
- (7) Mixing bias and radial tires on the same axle.
- (8) Tire flap protrudes through valve slot in rim and touches stem.
- (9) Regrooved tire except motor vehicles used solely in urban or suburban service (see exception in §393.75(e)).
- (10) Boot, blowout patch or other ply repair.
- (11) Weight carried exceeds tire load limit. This includes overloaded tire resulting from low air pressure.
- (12) Tire is flat or has noticeable (e.g., can be heard or felt) leak.
- (13) Any bus equipped with recapped or retreaded tire(s).
- (14) So mounted or inflated that it comes in contact with any part of the vehicle.

b. All tires other than those found on the steering axle of a power unit.

- (1) Weight carried exceeds tire load limit. This includes overloaded tire resulting from low air pressure.
- (2) Tire is flat or has noticeable (e.g., can be heard or felt) leak.
- (3) Has body ply or belt material exposed through the tread or sidewall.
- (4) Has any tread or sidewall separation.
- (5) Has a cut where ply or belt material is exposed.
- (6) So mounted or inflated that it comes in contact with any part of the vehicle. (This includes a tire that contacts its mate.)
- (7) Is marked "Not for highway use" or otherwise marked and having like meaning.
- (8) With less than $\frac{2}{32}$ inch tread when measured at any point on a major tread groove.

11. Wheels and Rims.

a. **Lock or Side Ring.** Bent, broken, cracked, improperly seated, sprung or mismatched ring(s).

b. **Wheels and Rims.** Cracked or broken or has elongated bolt holes.

c. **Fasteners (both spoke and disc wheels).** Any loose, missing, broken, cracked, stripped or otherwise ineffective fasteners.

d. Welds.

- (1) Any cracks in welds attaching disc wheel disc to rim.
- (2) Any crack in welds attaching tubeless demountable rim to adapter.
- (3) Any welded repair on aluminum wheel(s) on a steering axle.
- (4) Any welded repair other than disc to rim attachment on steel wheel(s) mounted on the steering axle.

12. Windshield Glazing.

(Not including a 2 inch border at the top, a 1 inch border at each side and the area below the topmost portion of the steering wheel.) Any crack, discoloration or vision reducing matter except: (1) coloring or tinting applied at time of manufacture; (2) any crack not over $\frac{1}{4}$ inch wide, if not intersected by any other crack; (3) any damaged area not more than $\frac{3}{4}$ inch in diameter, if not closer than

3 inches to any other such damaged area; (4) labels, stickers, decalcomania, etc. (see §393.60 for exceptions).

13. Windshield Wipers.

Any power unit that has an inoperative wiper, or missing or damaged parts that render it ineffective.

Comparison of Appendix G, and the new North American Uniform Driver-Vehicle Inspection Procedure (North American Commercial Vehicle Critical Safety Inspection Items and Out-Of-Service Criteria)

The vehicle portion of the FMCSA's North American Uniform Driver-Vehicle Inspection Procedure (NAUD-VIP) requirements, CVSA's North American Commercial Vehicle Critical Safety Inspection Items and Out-Of-Service Criteria and Appendix G of subchapter B are similar documents and follow the same inspection procedures. The same items are required to be inspected by each document. FMCSA's and CVSA's out-of-service criteria are intended to be used in random roadside inspections to identify critical vehicle inspection items and provide criteria for placing a vehicle(s) out-of-service. A vehicle(s) is placed out-of-service only when by reason of its mechanical condition or loading it is determined to be so imminently hazardous as to likely cause an accident or breakdown, or when such condition(s) would likely contribute to loss of control of the vehicle(s) by the driver. A certain amount of flexibility is given to the inspecting official whether to place the vehicle out-of-service at the inspection site or if it would be less hazardous to allow the vehicle to proceed to a repair facility for repair. The distance to the repair facility must not exceed 25 miles. The roadside type of inspection, however, does not necessarily mean that a vehicle has to be defect-free in order to continue in service.

In contrast, the Appendix G inspection procedure requires that all items required to be inspected are in proper adjustment, are not defective and function properly prior to the vehicle being placed in service.

Differences Between the Out-Of-Service Criteria & FMCSA's Annual Inspection

1. Brake System.

The Appendix G criteria rejects vehicles with any defective brakes, any air leaks, etc. The out-of-service criteria allows 20% defective brakes on non-steering axles and a certain latitude on air leaks before placing a vehicle out-of-service.

2. Coupling Devices.

Appendix G rejects vehicles with any fifth wheel mounting fastener missing or ineffective. The out-of-service criteria allows up to 20% missing or ineffective fasteners on frame mountings and pivot bracket mountings and 25% on sliderlatching fasteners. The out-of-service criteria also allows some latitude on cracked welds.

3. Exhaust System.

Appendix G follows §393.83 verbatim. The CVSA out-of-service criteria allows vehicles to exhaust forward of the dimensions given in §393.83 as long as the exhaust does not leak or exhaust under the chassis.

4. Fuel System.

Same for Appendix G and the out-of-service criteria.

5. Lighting Devices.

Appendix G requires all lighting devices required by part 393 to be operative at all times. The out-of-service criteria only requires one stop light and functioning turn signals on the rear most vehicle of a combination vehicle to be operative at all times. In addition one operative head lamp and tail lamp are required during the hours of darkness.

6. Safe Loading.

Same for both Appendix G and the out-of-service criteria.

7. Steering Mechanism.

Regulations

Steering lash requirements of Appendix G follows the new requirements of §393.209.

8. Suspension.

Appendix G follows the new requirements of §393.207 which does not allow any broken leaves in a leaf spring assembly. The out-of-service criteria allows up to 25% broken or missing leaves before being placed out-of-service.

9. Frame.

The out-of-service criteria allows a certain latitude in frame cracks before placing a vehicle out-of-service. Appendix G follows the new requirements of §393.201 which does not allow any frame cracks.

10. Tires.

Appendix G follows the requirements of §393.75 which requires a tire tread depth of $\frac{4}{32}$ inch on power unit steering axles and $\frac{2}{32}$ inch on all other axles. The out-of-service criteria only requires $\frac{2}{32}$ inch tire tread depth on power unit steering axles and $\frac{1}{32}$ inch on all other axles.

11. Wheel and Rims.

The out-of-service criteria allows a certain amount latitude for wheel and rim cracks and missing or defective fasteners. Appendix G meets the requirements of the new §393.205 which does not allow defective wheels and rims non-effective nuts and bolts.

12. Windshield Glazing.

The out-of-service criteria places in a restricted service condition any vehicle that has a crack or discoloration in the windshield area lying within the sweep of the wiper on the drivers side and does not address the remaining area of the wind shield. Appendix G addresses requirements for the whole windshield as specified in §393.60.

13. Windshield Wipers.

Appendix G requires windshield wipers to be operative at all times. The out-of-service criteria only requires that the windshield wiper on the driver's side to be inspected during inclement weather.

Vehicle Maintenance Pro

Reserved

Regulations

Selected regulations from Part 571 — Federal Motor Vehicle Safety Standards

This section contains only the standards from 49 CFR 571 that apply to vehicles with a gross weight vehicle rating of 10,000 pounds or more, or are designed to carry passengers (buses and school buses). The standards that apply entirely to personal passenger vehicles and the related safety equipment (child car seats, helmets, etc.) have not been included.

Subpart A—General

§571.1 Scope

This part contains the Federal Motor Vehicle Safety Standards for motor vehicles and motor vehicle equipment established under section 103 of the National Traffic and Motor Vehicle Safety Act of 1966 (80 Stat. 718).

§571.3 Definitions.

(a) Statutory definitions. All terms defined in section 102 of the Act are used in their statutory meaning.

(b) Other definitions. As used in this chapter—

Act means the National Traffic and Motor Vehicle Safety Act of 1966 (80 Stat. 718).

Approved, unless used with reference to another person, means approved by the Secretary.

Boat trailer means a trailer designed with cradle-type mountings to transport a boat and configured to permit launching of the boat from the rear of the trailer.

Bus means a motor vehicle with motive power, except a trailer, designed for carrying more than 10 persons.

Curb weight means the weight of a motor vehicle with standard equipment; maximum capacity of engine fuel, oil, and coolant; and, if so equipped, air conditioning and additional weight optional engine.

Designated seating capacity means the number of designated seating positions provided.

Designated seating position means

(1) For vehicles manufactured prior to September 1, 2011, any plan view location capable of accommodating a person at least as large as a 5th percentile adult female, if the overall seat configuration and design and vehicle design is such that the position is likely to be used as a seating position while the vehicle is in motion, except for auxiliary seating accommodations such as temporary or folding jump seats. Any bench or split-bench seat in a passenger car, truck or multipurpose passenger vehicle with a GVWR less than 4,536 kilograms (10,000 pounds), having greater than 127 centimeters (50 inches) of hip room (measured in accordance with Society of Automotive Engineers (SAE) Recommended Practice J1100a, revised September 1975, "Motor Vehicle Dimensions" (incorporated by reference, see §571.5), shall have not less than three designated seating positions, unless the seat design or vehicle design is such that the center position cannot be used for seating. For the sole purpose of determining the classification of any vehicle sold or intro-

duced into interstate commerce for purposes that include carrying students to and from school or related events, any location in such vehicle intended for securement of an occupied wheelchair during vehicle operation shall be regarded as four designated seating positions.

(2) For vehicles manufactured on and after September 1, 2011, *designated seating position* means a seat location that has a seating surface width, as described in §571.10(c) of this part, of at least 330 mm (13 inches). The number of designated seating positions at a seat location is determined according to the procedure set forth in §571.10(b) of this part. However, for trucks and multipurpose passenger vehicles with a gross vehicle weight rating greater than 10,000 lbs, police vehicles as defined in S7 of FMVSS No. 208, firefighting vehicles, ambulances, and motor homes, a seating location that is labeled in accordance with S4.4 of FMVSS No. 207 will not be considered a designated seating position. For the sole purpose of determining the classification of any vehicle sold or introduced into interstate commerce for purposes that include carrying students to and from school or related events, any location in such a vehicle intended for securement of an occupied wheelchair during vehicle operation is regarded as four designated seating positions. means:

Driver means the occupant of a motor vehicle seated immediately behind the steering control system.

Emergency brake means a mechanism designed to stop a motor vehicle after a failure of the service brake system.

5th percentile adult female means a person possessing the dimensions and weight of the 5th percentile adult female specified for the total age group in "Weight, Height, and Selected Body Dimensions of Adults: United States— 1960–1962," first published as Public Health Service Publication No. 1000 Series 11–No. 8, June 1965 and republished as DHEW Publication No. (HRA) 76–1074 (incorporated by reference, see §571.5).

Firefighting vehicle means a vehicle designed exclusively for the purpose of fighting fires.

Fixed collision barrier means a flat, vertical, unyielding surface with the following characteristics:

(1) The surface is sufficiently large that when struck by a tested vehicle, no portion of the vehicle projects or passes beyond the surface.

(2) The approach is a horizontal surface that is large enough for the vehicle to attain a stable attitude during its approach to the barrier, and that does not restrict vehicle motion during impact.

(3) When struck by a vehicle, the surface and its supporting structure absorb no significant portion of the vehicle's kinetic energy, so that a performance requirement described in terms of impact with a fixed collision barrier must be met no matter how small an amount of energy is absorbed by the barrier.

Forward control means a configuration in which more than half of the engine length is rearward of the foremost point of the windshield base and the steering wheel hub is in the forward quarter of the vehicle length.

Full trailer means a trailer, except a pole trailer, that is equipped with two or more axles that support the entire weight of the trailer.

Vehicle Maintenance Pro

Gross axle weight rating or GAWR means the value specified by the vehicle manufacturer as the load-carrying capacity of a single axle system, as measured at the tire-ground interfaces.

Gross combination weight rating or GCWR means the value specified by the manufacturer as the loaded weight of a combination vehicle.

Gross vehicle weight rating or GVWR means the value specified by the manufacturer as the loaded weight of a single vehicle.

H point means the pivot center of the torso and thigh on the three-dimensional device used in defining and measuring vehicle seating accommodation, as defined in Society of Automotive Engineers (SAE) Recommended Practice J1100, revised February 2001, "Motor Vehicle Dimensions" (incorporated by reference, see §571.5).

Head impact area means all nonglazed surfaces of the interior of a vehicle that are statically contactable by a 6.5-inch diameter spherical head form of a measuring device having a pivot point to "top-of-head" dimension infinitely adjustable from 29 to 33 inches in accordance with the following procedure, or its graphic equivalent:

(a) At each designated seating position, place the pivot point of the measuring device—

- (1) For seats that are adjustable fore and aft, at—
 - (i) The seating reference point; and
 - (ii) A point 5 inches horizontally forward of the seating reference point and vertically above the seating reference point an amount equal to the rise which results from a 5-inch forward adjustment of the seat or 0.75 inch; and

(2) For seats that are not adjustable fore and aft, at the seating reference point.

(b) With the pivot point to "top-of-head" dimension at each value allowed by the device and the interior dimensions of the vehicle, determine all contact points above the lower windshield glass line and forward of the seating reference point.

(c) With the head form at each contact point, and with the device in a vertical position if no contact points exists for a particular adjusted length, pivot the measuring device forward and downward through all arcs in vertical planes to 90° each side of the vertical longitudinal plane through the seating reference point, until the head form contacts an interior surface or until it is tangent to a horizontal plane 1 inch above the seating reference point, whichever occurs first.

Interior compartment door means any door in the interior of the vehicle installed by the manufacturer as a cover for storage space normally used for personal effects.

Longitudinal or longitudinally means parallel to the longitudinal centerline of the vehicle.

Low-speed vehicle (LSV) means a motor vehicle,

- (1) That is 4-wheeled,
- (2) Whose speed attainable in 1.6 km (1 mile) is more than 32 kilometers per hour (20 miles per hour) and not more than 40 kilometers per hour (25 miles per hour) on a paved level surface, and
- (3) Whose GVWR is less than 1,361 kilograms (3,000 pounds).

Motorcycle means a motor vehicle with motive power having a seat or saddle for the use of the rider and designed to travel on not more than three wheels in contact with the ground.

Motor-driven cycle means a motorcycle with a motor that produces 5-brake horsepower or less.

Motor home means a multipurpose passenger vehicle with motive power that is designed to provide temporary residential accommodations, as evidenced by the presence of at least four of the following facilities: Cooking; refrigeration or ice box; self-contained toilet; heating and/or air conditioning; a potable water supply system including a faucet and a sink; and a separate 110-125 volt electrical power supply and/or propane.

Multifunction school activity bus (MFSAB) means a school bus whose purposes do not include transporting students to and from home or school bus stops.

Multipurpose passenger vehicle means a motor vehicle with motive power, except a low-speed vehicle or trailer, designed to carry 10 persons or less which is constructed either on a truck chassis or with special features for occasional off-road operation.

Open-body type vehicle means a vehicle having no occupant compartment top or an occupant compartment top that can be installed or removed by the user at his convenience.

Outboard designated seating position means a designated seating position where a longitudinal vertical plane tangent to the outboard side of the seat cushion is less than 12 inches from the innermost point on the inside surface of the vehicle at a height between the design H-point and the shoulder reference point (as shown in fig. 1 of Federal Motor Vehicle Safety Standard No. 210) and longitudinally between the front and rear edges of the seat cushion.

Overall vehicle width means the nominal design dimension of the widest part of the vehicle, exclusive of signal lamps, marker lamps, outside rearview mirrors, flexible fender extensions, and mud flaps, determined with doors and windows closed and the wheels in the straight-ahead position.

Parking brake means a mechanism designed to prevent the movement of a stationary motor vehicle.

Passenger car means a motor vehicle with motive power, except a low-speed vehicle, multipurpose passenger vehicle, motorcycle, or trailer, designed for carrying 10 persons or less.

Pelvic impact area means that area of the door or body side panel adjacent to any outboard designated seating position which is bounded by horizontal planes 7 inches above and 4 inches below the seating reference point and vertical transverse planes 8 inches forward and 2 inches rearward of the seating reference point.

Pole trailer means a motor vehicle without motive power designed to be drawn by another motor vehicle and attached to the towing vehicle by means of a reach or pole, or by being boomed or otherwise secured to the towing vehicle, for transporting long or irregularly shaped loads such as poles, pipes, or structural members capable generally of sustaining themselves as beams between the supporting connections.

Recreation vehicle trailer means a trailer, except a trailer designed primarily to transport cargo, designed

Regulations

to be drawn by a vehicle with motive power by means of a bumper, frame or fifth wheel hitch and designed to provide temporary residential accommodations, as evidenced by the presence of at least four of the following facilities: cooking; refrigeration or ice box; self-contained toilet; heating and/or air conditioning; a potable water supply system including a faucet and a sink; and a separate 110–125 volt electrical power supply and/or propane. “Recreation vehicle trailer” includes trailers used for personal purposes, commonly known as “sport utility RVs” or “toy haulers,” which usually have spacious rather than incidental living quarters and provide a cargo area for smaller items for personal use such as motorcycles, mountain bikes, all terrain vehicles (ATVs), snowmobiles, canoes or other types of recreational gear.

School bus means a bus that is sold, or introduced in interstate commerce, for purposes that include carrying students to and from school or related events, but does not include a bus designed and sold for operation as a common carrier in urban transportation.

Seating reference point (SgRP) means the unique design H-point, as defined in Society of Automotive Engineers (SAE) Recommended Practice J1100, revised June 1984, “Motor Vehicle Dimensions” (incorporated by reference, see §571.5), which:

(1) Establishes the rearmost normal design driving or riding position of each designated seating position, which includes consideration of all modes of adjustment, horizontal, vertical, and tilt, in a vehicle;

(2) Has X, Y, and Z coordinates, as defined in Society of Automotive Engineers (SAE) Recommended Practice J1100, revised June 1984, “Motor Vehicle Dimensions” (incorporated by reference, see §571.5), established relative to the designed vehicle structure;

(3) Simulates the position of the pivot center of the human torso and thigh; and

(4) Is the reference point employed to position the two-dimensional drafting template with the 95th percentile leg described in Society of Automotive Engineers (SAE) Standard J826, revised May 1987, “Devices for Use in Defining and Measuring Vehicle Seating Accommodation” (incorporated by reference, see §571.5), or, if the drafting template with the 95th percentile leg cannot be positioned in the seating position, is located with the seat in its most rearward adjustment position.

Semitrailer means a trailer, except a pole trailer, so constructed that a substantial part of its weight rests upon or is carried by another motor vehicle.

Service brake means the primary mechanism designed to stop a motor vehicle.

Speed attainable in 1 mile means the speed attainable by accelerating at maximum rate from a standing start for 1 mile, on a level surface.

Speed attainable in 2 miles means the speed attainable by accelerating at maximum rate from a standing start for 2 miles, on a level surface.

Torso line means the line connecting the “H” point and the shoulder reference point as defined in Society of Automotive Engineers (SAE) Standard J787b, revised September 1966, “Motor Vehicle Seat Belt Anchorage” (incorporated by reference, see §571.5).

Trailer means a motor vehicle with or without motive power, designed for carrying persons or property and for being drawn by another motor vehicle.

Trailer converter dolly means a trailer chassis equipped with one or more axles, a lower half of a fifth wheel and a drawbar.

Truck means a motor vehicle with motive power, except a trailer, designed primarily for the transportation of property or special purpose equipment.

Truck tractor means a truck designed primarily for drawing other motor vehicles and not so constructed as to carry a load other than a part of the weight of the vehicle and the load so drawn.

Unloaded vehicle weight means the weight of a vehicle with maximum capacity of all fluids necessary for operation of the vehicle, but without cargo, occupants, or accessories that are ordinarily removed from the vehicle when they are not in use.

95th percentile adult male means a person possessing the dimensions and weight of the 95th percentile adult male specified “Weight, Height, and Selected Body Dimensions of Adults: United States—1960–1962,” first published as Public Health Service Publication No. 1000 Series 11-No. 8, June 1965 and republished as DHEW Publication No. (HRA) 76–1074 (incorporated by reference, see §571.5).

Vehicle fuel tank capacity means the tank’s unusable capacity (i.e., the volume of fuel left at the bottom of the tank when the vehicle’s fuel pump can no longer draw fuel from the tank) plus its usable capacity (i.e., the volume of fuel that can be pumped into the tank through the filler pipe with the vehicle on a level surface and with the unusable capacity already in the tank). The term does not include the vapor volume of the tank (i.e., the space above the fuel tank filler neck) nor the volume of the fuel tank filler neck.

EDITORIAL NOTE: For *Federal Register* citations affecting § 571.3, see the List of CFR Sections Affected, which appears in the Finding Aids section of the printed volume and on GPO Access.

§571.4 Explanation of usage.

The word any, used in connection with a range of values or set of items in the requirements, conditions, and procedures of the standards or regulations in this chapter, means generally the totality of the items or values, any one of which may be selected by the Administration for testing, except where clearly specified otherwise.

Examples: “The vehicle shall meet the requirements of S4.1 when tested at any point between 18 and 22 inches above the ground.” This means that the vehicle must be capable of meeting the specified requirements at every point between 18 and 22 inches above the ground. The test in question for a given vehicle may call for a single test (a single impact, for example), but the vehicle must meet the requirement at whatever point the Administration selects, within the specified range.

“Each tire shall be capable of meeting the requirements of this standard when mounted on any rim specified by the manufacturer as suitable for use with that tire.” This means that, where the manufacturer specifies more than one rim as suitable for use with a tire,

Vehicle Maintenance Pro

the tire must meet the requirements with whatever rim the Administration selects from the specified group.

“Any one of the items listed below may, at the option of the manufacturer, be substituted for the hardware specified in S4.1.” Here the wording clearly indicates that the selection of items is at the manufacturer’s option.

§571.5 Matter incorporated by reference.

(a) Certain material is incorporated by reference into this part with the approval of the Director of the *Federal Register* under 5 U.S.C. 552(a) and 1 CFR part 51. To enforce any edition other than that specified in this section, the National Highway Traffic Safety Administration (NHTSA) must publish notice of change in the *Federal Register* and the material must be available to the public. All approved material is available for inspection at NHTSA, 1200 New Jersey Avenue SE., Washington, DC 20590, and at the National Archives and Records Administration (NARA). For information on the availability of this material at NHTSA, or if you experience difficulty obtaining the standards referenced below, contact NHTSA Office of Technical Information Services, phone number (202) 366-2588. For information on the availability of this material at NARA, call (202) 741-6030, or go to: <http://www.archives.gov/federal-register/cfr/ibr-locations.html>.

(2) ASTM B117-64, “Standard Method of Salt Spray (Fog) Testing,” revised 1964, into §571.125.

(3) ASTM B117-73 (Reapproved 1979), “Standard Method of Salt Spray (Fog) Testing,” approved March 29, 1973, into §§571.108; 571.209.

(4) ASTM B117-97, “Standard Practice for Operating Salt Spray (Fog) Apparatus,” approved April 10, 1997, into §571.403.

(5) ASTM B117-03, “Standard Practice for Operating Salt Spray (Fog) Apparatus,” approved October 1, 2003, into §§571.106; 571.111.

(6) ASTM B456-79, “Standard Specification for Electrodeposited Coatings of Copper Plus Nickel Plus Chromium and Nickel Plus Chromium,” approved January 26, 1979, into §571.209.

(7) ASTM B456-95, “Standard Specification for Electrodeposited Coatings of Copper Plus Nickel Plus Chromium and Nickel Plus Chromium,” approved October 10, 1995, into §571.403.

(8) ASTM C150-56, “Standard Specification for Portland Cement,” approved 1956, into §571.108.

(9) ASTM C150-77, “Standard Specification for Portland Cement,” approved February 26, 1977, into §571.108.

(10) ASTM D362-84, “Standard Specification for Industrial Grade Toluene,” approved March 30, 1984, into §§571.108; 571.205(a).

(11) ASTM D445-65, “Standard Method of Test for Viscosity of Transparent and Opaque Liquids (Kinematic and Dynamic Viscosities),” approved August 31, 1965, into §571.116.

(12) ASTM D471-98, “Standard Test Method for Rubber Property-Effect of Liquids,” approved November 10, 1998, into §571.106.

(13) ASTM D484-71, “Standard Specification for Hydrocarbon Drycleaning Solvents,” effective September 15, 1971, into §571.301.

(14) ASTM D756-78, “Standard Practice for Determination of Weight and Shape Changes of Plastics under Accelerated Service Conditions,” approved July 28, 1978, into §571.209.

(15) ASTM D1003-92, “Standard Test Method for Haze and Luminous Transmittance of Transparent Plastics,” approved October 15, 1992, into §571.108.

(16) ASTM D1056-07, “Standard Specification for Flexible Cellular Materials-Sponge or Expanded Rubber,” approved March 1, 2007, into §571.213.

(17) ASTM D1121-67, “Standard Method of Test for Reserve Alkalinity of Engine Antifreezes and Antirusts,” accepted June 12, 1967, into §571.116.

Regulations

(18) ASTM D1123-59, "Standard Method of Test for Water in Concentrated Engine Antifreezes by the Iodine Reagent Method," revised 1959, into §571.116.

(19) ASTM D1193-70, "Standard Specification for Reagent Water," effective October 2, 1970, into §571.116.

(20) ASTM D1415-68, "Standard Method of Test for International Hardness of Vulcanized Natural and Synthetic Rubbers," accepted February 14, 1968, into §571.116.

(21) ASTM D2515-66, "Standard Specification for Kinematic Glass Viscometers," adopted 1966, into §571.116.

(22) ASTM D4329-99, "Standard Practice for Fluorescent UV Exposure of Plastics," approved January 10, 1999, into §571.106.

(23) ASTM D4956-90, "Standard Specification for Retroreflective Sheeting for Traffic Control," approved October 26, 1990, into §571.108.

(24) ASTM E1-68, "Standard Specifications for ASTM Thermometers" (including tentative revisions), accepted September 13, 1968, into §571.116.

(25) ASTM E4-79, "Standard Methods of Load Verification of Testing Machines," approved June 11, 1979, into §571.209.

(26) ASTM E4-03, "Standard Practices for Force Verification of Testing Machines," approved August 10, 2003, into §571.106.

(27) ASTM E8-89, "Standard Test Methods of Tension Testing of Metallic Materials," approved May 15, 1989, into §571.221.

(28) ASTM E77-66, "Standard Method for Inspection, Test, and Standardization of Etched-Stem Liquid-in-Glass Thermometers," revised 1966, into §571.116.

(29) ASTM E274-65T, "Tentative Method of Test for Skid Resistance of Pavements Using a Two-Wheel Trailer," issued 1965, into §§571.208; 571.301.

(30) ASTM E274-70, "Standard Method of Test for Skid Resistance of Paved Surfaces Using a Full-Scale Tire," 114 Privacy Act of 1974: Systems of Records, 65 FR 19476, 19478 (Apr. 11, 2000). revised July 1974, into §§571.105; 571.122a.

(31) ASTM E298-68, "Standard Methods for Assay of Organic Peroxides," effective September 13, 1968, into §571.116.

(32) ASTM E308-66, "Standard Practice for Spectrophotometry and Description of Color in CIE 1931 System," reapproved 1981, into §571.108.

(33) ASTM E1136-93 (Reapproved 2003), "Standard Specification for a Radial Standard Reference Test Tire," approved March 15, 1993, into §§571.105; 571.121; 571.122; 571.126; 571.135; 571.139; 571.500.

(34) ASTM E1337-90 (Reapproved 2008), "Standard Test Method for Determining Longitudinal Peak Braking Coefficient of Paved Surfaces Using a Standard Reference Test Tire," approved June 1, 2008, into §§571.105; 571.121; 571.122; 571.126; 571.135; 571.500.

(35) ASTM F1805-00, "Standard Test Method for Single Wheel Driving Traction in a Straight Line on Snow- and Ice-Covered Surfaces," approved November 10, 2000, into §571.139.

(36) ASTM G23-81, "Standard Practice for Generating Light-Exposure Apparatus (Carbon-Arc Type) With and Without Water for Exposure of Nonmetallic Materials," approved March 26, 1981, into §571.209.

(37) ASTM G151-97, "Standard Practice for Exposing Nonmetallic Materials in Accelerated Test Devices that Use Laboratory Light Sources," approved July 10, 1997, into §571.106.

(38) ASTM G154-00, "Standard Practice for Operating Fluorescent Light Apparatus for UV Exposure of Nonmetallic Materials," approved February 10, 2000, into §571.106.

(2) UNECE Regulation 48 "Uniform Provisions Concerning the Approval of Vehicles With Regard to the Installation of Lighting and Light-Signaling Devices,"

E/ECE/324-E/ECE/TRANS/505, Rev.1/Add.47/Rev.1/Corr.2 (February 26, 1996), into §571.108.

§571.7 Applicability.

(a) **General.** Except as provided in paragraphs (c) and (d) of this section, each standard set forth in subpart B of this part applies according to its terms to all motor vehicles or items of motor vehicle equipment the manufacture of which is completed on or after the effective date of the standard.

(b) [Reserved]

(c) **Military vehicles.** No standard applies to a vehicle or item of equipment manufactured for, and sold directly to, the Armed Forces of the United States in conformity with contractual specifications.

(d) **Export.** No standard applies to a vehicle or item of equipment in the circumstances provided in section 108(b)(5) of the Act (15 U.S.C. 1397 (b)(5)).

(e) **Combining new and used components.** When a new cab is used in the assembly of a truck, the truck will be considered newly manufactured for purposes of paragraph (a) of this section, the application of the requirements of this chapter, and the Act, unless the engine, transmission, and drive axle(s) (as a minimum) of the assembled vehicle are not new, and at least two of these components were taken from the same vehicle.

(f) **Combining new and used components in trailer manufacture.** When new materials are used in the assembly of a trailer, the trailer will be considered newly manufactured for purposes of paragraph (a) of this section, the application of the requirements of this chapter, and the Act, unless, at a minimum, the trailer running gear assembly (axle(s), wheels, braking and suspension) is not new, and was taken from an existing trailer—

(1) Whose identity is continued in the reassembled vehicle with respect to the Vehicle Identification Number; and

Vehicle Maintenance Pro

Reserved

Regulations

(2) That is owned or leased by the user of the reassembled vehicle.

§571.8 Effective date.

(a) **Firefighting vehicles.** Notwithstanding the effective date provisions of the motor vehicle safety standards in this part, the effective date of any standard or amendment of a standard issued after September 1, 1971, to which firefighting vehicles must conform shall be, with respect to such vehicles, either 2 years after the date on which such standard or amendment is published in the rules and regulations section of the *Federal Register*, or the effective date specified in the notice, whichever is later, except as such standard or amendment may otherwise specifically provide with respect to firefighting vehicles.

(b) **Vehicles built in two or more stages vehicles and altered vehicles.** Unless Congress directs or the agency expressly determines that this paragraph does not apply, the date for manufacturer certification of compliance with any standard, or amendment to a standard, that is issued on or after September 1, 2006 is, insofar as its application to intermediate and final-stage manufacturers and alterers is concerned, one year after the last applicable date for manufacturer certification of compliance. Nothing in this provision shall be construed as prohibiting earlier compliance with the standard or amendment or as precluding NHTSA from extending a compliance effective date for intermediate and final-stage manufacturers and alterers by more than one year.

§571.9 Separability.

If any standard established in this part or its application to any person or circumstance is held invalid, the remainder of the part and the application of that standard to other persons or circumstances is not affected thereby.

§571.10 Designation of Seating Positions.

(a) **Application.** This section applies to passenger cars, trucks, multipurpose passenger vehicles, and buses manufactured on or after September 1, 2010. However, paragraph (b) of this section does not apply to trucks and multipurpose passenger vehicles with a gross vehicle weight rating greater than 10,000 lbs, school buses, police vehicles as defined in S7 of Standard No. 208 (49 CFR 571.208), firefighting vehicles, ambulances, or motor homes. To determine the number of passenger seating positions in school buses, see S4.1 of Standard No. 222 (49 CFR 571.222).

(b) Number of designated seating positions. The formula for calculating the number of designated seating positions (N) for any seat location with a seating surface width greater than 330 mm (13 inches) is as follows:

(b)(1) For seat locations with a seating surface width, as described in paragraph (c), of less than 1400 mm (55.2 inches): $N = \text{The greater of 1 or } \lceil \text{seating surface width (in mm)/350} \rceil$ rounded down to the nearest whole number;

(b)(2) For seat locations with a seating surface width, as described in paragraph (c), greater than or equal to 1400 mm (55.2 inches): $N = \text{No less than } \lceil \text{seating sur-$

face width (in mm)/350 $\rceil$ rounded down to the nearest whole number.

(c) Seating surface measurement.

(1) As used in this section, “seating surface” only includes the seat cushion and soft trim and excludes unpadded trim components such as a decorative seat shield, seat adjusters, or adjuster covers. As used in paragraphs (c)(1)(ii) and (iii) of this section, “outboard” and “inboard” are determined with respect to the measurement zone established in paragraph (c)(1)(i) of this section. As used in this section, “seating surface width” is the maximum horizontal width of a seating surface determined by the following procedure:

(i) Establish a measurement zone bounded by two vertical planes oriented perpendicular to the direction the seat is facing. One is located 150 mm (5.9 inches) behind the front leading surface of the seat and the other is located 250 mm (9.8 inches) behind the front leading surface of the seat. A measurement location within this zone is any vertical plane parallel to the planes establishing the boundary of the zone.

(ii) For each measurement location within the zone, establish vertical reference planes parallel to the direction the seat faces that intersect the most outboard point on each side of the seating surface at that measurement location. If outboard interior trim contacts the top surface of the seat cushion, establish another vertical plane parallel to the direction the seat faces that intersects the most inboard point of contact between outboard interior trim and the top surface of the seat cushion.

(iii) For measurement within the zone, measure horizontally between and perpendicular to the most inboard vertical reference planes established in (ii), as shown in Figure 1 (provided for illustration purposes).

(c)(2) Adjacent seating surfaces are considered to form a single, continuous seating surface whose overall width is measured as specified in (c)(1) of this section, unless

(c)(2)(i) The seating surfaces are separated by:

(c)(2)(i)(A) A fixed trimmed surface whose top surface is unpadded and that has a width not less than 140 mm (5.5 inches), as measured in each transverse vertical plane within that measurement zone, or

(c)(2)(i)(B) A void whose cross section in each transverse vertical plane within that measurement zone is a rectangle that is not less than 140 mm (5.5 inches) wide and not less than 140 mm (5.5 inches) deep. The top edge of the cross section in any such plane is congruent with the transverse horizontal line that intersects the lowest point on the portion of the top profile of the seating surfaces that lie within that plane, or

(c)(2)(ii) Interior trim interrupts the measurement of the nominal hip room between adjacent seating surfaces, measured laterally along the “X” plane through the H-point. For purposes of this paragraph, the H-point is located using the SAE three-dimensional H-point machine per Society of Automotive Engineers (SAE) Surface Vehicle Standard J826, revised July

Vehicle Maintenance Pro

1995, “Devices for Use in Defining and Measuring Vehicle Seating Accommodation” (incorporated by reference, see section 571.5) with the legs and leg weights removed, or

(c)(2)(iii) The seating surfaces are adjacent outboard seats, and the lateral distance between any point on the seat cushion of one seat and any point on the seat cushion of the other seat is not less than 140 mm (5.5 inches).

(c)(3) Folding, removable, and adjustable seats are measured in the configuration that results in the single largest maximum seating surface width.

FIGURE 1: Example Measurements for Seat Cushion Width
Plan view of a seat showing several example measurement locations for the determination of seating surface width. Measurement 1 is the seat surface width for this illustration.

Selections from Subpart B— Federal motor vehicle safety standards

§571.101 Standard No. 101; Controls and displays.

S1. Scope. This standard specifies performance requirements for location, identification, color, and illumination of motor vehicle controls, telltales and indicators.

S2. Purpose. The purpose of this standard is to ensure the accessibility, visibility and recognition of motor vehicle controls, telltales and indicators, and to facilitate the proper selection of controls under daylight and nighttime conditions, in order to reduce the safety hazards caused by the diversion of the driver's attention from the driving task, and by mistakes in selecting controls.

S3. Application. This standard applies to passenger cars, multipurpose passenger vehicles, trucks, and buses.

S4. Definitions.

Adjacent, with respect to a control, telltale or indicator, and its identifier means:

(a) The identifier is in close proximity to the control, telltale or indicator; and

(b) No other control, telltale, indicator, identifier or source of illumination appears between the identifier and the telltale, indicator, or control that the identifier identifies.

Common space means an area on which more than one telltale, indicator, identifier, or other message may be displayed, but not simultaneously.

Control means the hand-operated part of a device that enables the driver to change the state or functioning of the vehicle or a vehicle subsystem.

Indicator means a device that shows the magnitude of the physical characteristics that the instrument is designed to sense.

Identifier means a symbol, word, or words used to identify a control, telltale, or indicator.

Multi-function control means a control through which the driver may select, and affect the operation of, more than one vehicle function.

Multi-task display means a display on which more than one message can be shown simultaneously.

Telltale means an optical signal that, when illuminated, indicates the actuation of a device, a correct or improper functioning or condition, or a failure to function.

S5. Requirements. Each passenger car, multipurpose passenger vehicle, truck and bus that is fitted with a control, a telltale or an indicator listed in Table 1 or Table 2 must meet the requirements of this standard for the location, identification, color, and illumination of that control, telltale or indicator. However, the requirements for telltales and indicators do not apply to vehicles with GVWRs of 4,536 kg or greater if these specified vehicles are manufactured before September 1, 2013.

S5.1 Location

S5.1.1 The controls listed in Table 1 and in Table 2 must be located so they are operable by the driver under the conditions of S5.6.2.

S5.1.2 The telltales and indicators listed in Table 1 and Table 2 and their identification must be located so that, when activated, they are visible to a driver under the conditions of S5.6.1 and S5.6.2.

S5.1.3 Except as provided in S5.1.4, the identification for controls, telltales and indicators must be placed on or adjacent to the telltale, indicator or control that it identifies.

S5.1.4 The requirement of S5.1.3 does not apply to a multi-function control, provided the multi-function control is associated with a multi-task display that:

(a) Is visible to the driver under the conditions of S5.6.1 and S5.6.2,

(b) Identifies the multi-function control with which it is associated graphically or using words,

(c) For multi-task displays with layers, identifies on the top-most layer each system for which control is possible from the associated multi-function control, including systems not otherwise regulated by this standard. Subfunctions of the available systems need not be shown on the top-most layer of the multi-task display, and

(d) Identifies the controls of Table 1 and Table 2 with the identification specified in those tables or otherwise required by this standard, whenever those are the active functions of the multi-function control. For lower levels of multi-task displays with layers, identification

Regulations

is permitted but not required for systems not otherwise regulated by this standard.

- (e) Does not display telltales listed in Table 1 or Table 2.

S5.2 Identification

S5.2.1 Except for the Low Tire Pressure Telltale, each control, telltale and indicator that is listed in column 1 of Table 1 or Table 2 must be identified by the symbol specified for it in column 2 or the word or abbreviation specified for it in column 3 of Table 1 or Table 2. If a symbol is used, each symbol provided pursuant to this paragraph must be substantially similar in form to the symbol as it appears in Table 1 or Table 2. If a symbol is used, each symbol provided pursuant to this paragraph must have the proportional dimensional characteristics of the symbol as it appears in Table 1 or Table 2. The Low Tire Pressure Telltale (either the display identifying which tire has low pressure or the display which does not identify which tire has low pressure) shall be identified by the appropriate symbol designated in column 4, or both the symbol in column 4 and the words in column 3. No identification is required for any horn (*i.e.*, audible warning signal) that is activated by a lanyard or by the driver pressing on the center of the face plane of the steering wheel hub; or for a turn signal control that is operated in a plane essentially parallel to the face plane of the steering wheel in its normal driving position and which is located on the left side of the steering column so that it is the control on that side of the column nearest to the steering wheel face plane. However, if identification is provided for a horn control in the center of the face plane of the steering wheel hub, the identifier must meet Table 2 requirements for the horn.

S5.2.2 Any symbol, word, or abbreviation not shown in Table 1 or Table 2 may be used to identify a control, a telltale or an indicator that is not listed in those tables.

S5.2.3 Supplementary symbols, words, or abbreviations may be used at the manufacturer's discretion in conjunction with any symbol, word, or abbreviation specified in Table 1 or Table 2.

S5.2.4 [Reserved]

S5.2.5 A single symbol, word, or abbreviation may be used to identify any combination of the control, indicator, and telltale for the same function.

S5.2.6 Except as provided in S5.2.7, all identifications of telltales, indicators and controls listed in Table 1 or Table 2 must appear to the driver to be perceptually upright. A rotating control that has an "off" position shall appear to the driver perceptually upright when the rotating control is in the "off" position.

S5.2.7 The identification of the following items need not appear to the driver to be perceptually upright:

- (a) A horn control;
- (b) Any control, telltale or indicator located on the steering wheel, when the steering wheel is positioned for the motor vehicle to travel in a direction other than straight forward; and
- (c) Any rotating control that does not have an "off" position.

S5.2.8 Each control for an automatic vehicle speed system (cruise control) and each control for heating and air conditioning systems must have identification provided for each function of each such system.

S5.2.9 Each control that regulates a system function over a continuous range must have identification provided for the limits of the adjustment range of that function. If color coding is used to identify the limits of the adjustment range of a temperature function, the hot limit must be identified by the color red and the cold limit by the color blue. If the status or limit of a function is shown by a display not adjacent to the control for that function, both the control (unless it is a multi-function control complying with S5.1.4) and the display must be independently identified as to the function of the control, in compliance with S5.2.1, on or adjacent to the control and on or adjacent to the display.

Example 1. A slide lever controls the temperature of the air in the vehicle heating system over a continuous range, from no heat to maximum heat. Since the control regulates a single function over a quantitative range, only the extreme positions require identification.

Example 2. A switch has three positions, for heat, defrost, and air conditioning. Since each position regulates a different function, each position must be identified.

S5.3 Illumination

S5.3.1 Timing of illumination

(a) Except as provided in S5.3.1(c), the identifications of controls for which the word "Yes" is specified in column 5 of Table 1 must be capable of being illuminated whenever the headlamps are activated. This requirement does not apply to a control located on the floor, floor console, steering wheel, steering column, or in the area of windshield header, or to a control for a heating and air-conditioning system that does not direct air upon the windshield.

(b) Except as provided in S5.3.1(c), the indicators and their identifications for which the word "Yes" is specified in column 5 of Table 1 must be illuminated whenever the vehicle's propulsion system and headlamps are activated.

(c) The indicators, their identifications and the identifications of controls need not be illuminated when the headlamps are being flashed or operated as daytime running lamps.

(d) At the manufacturer's option, any control, indicator, or their identifications may be capable of being illuminated at any time.

(e) A telltale must not emit light except when identifying the malfunction or vehicle condition it is designed to indicate, or during a bulb check.

S5.3.2 Brightness of illumination of controls and indicators

S5.3.2.1 Means must be provided for illuminating the indicators, identifications of indicators and identifications of controls listed in Table 1 to make them visible to the driver under daylight and nighttime driving conditions.

Vehicle Maintenance Pro

S5.3.2.2 The means of providing the visibility required by S5.3.2.1:

(a) Must be adjustable to provide at least two levels of brightness;

(b) At a level of brightness other than the highest level, the identification of controls and indicators must be barely discernible to the driver who has adapted to dark ambient roadway condition;

(c) May be operable manually or automatically; and

(d) May have levels of brightness, other than the two required visible levels of brightness, at which those items and identification are not visible.

(1) If the level of brightness is adjusted by automatic means to a point where those items or their identification are not visible to the driver, means shall be provided to enable the driver to restore visibility.

S5.3.3 Brightness of telltale illumination

(a) Means must be provided for illuminating telltales and their identification sufficiently to make them visible to the driver under daylight and nighttime driving conditions.

(b) The means for providing the required visibility may be adjustable manually or automatically, except that the telltales and identification for brakes, high-beams, turn signals, and safety belts may not be adjustable under any driving condition to a level that is invisible.

S5.3.4 Brightness of interior lamps. (a) Any source of illumination within the passenger compartment which is forward of a transverse vertical plane 110 mm rearward of the manikin "H" point with the driver's seat in its rearmost driving position, which is not used for the controls and displays regulated by this standard, which is not a telltale, and which is capable of being illuminated while the vehicle is in motion, shall have either:

(1) Light intensity which is manually or automatically adjustable to provide at least two levels of brightness;

(2) A single intensity that is barely discernible to a driver who has adapted to dark ambient roadway conditions; or

(3) A means of being turned off.

(b) Paragraph (a) of S5.3.4 does not apply to buses that are normally operated with the passenger compartment illuminated.

S5.3.5 The provisions of S5.3.4 do not apply to buses that are normally operated with the passenger compartment illuminated.

S5.4 Color

S5.4.1 The light of each telltale listed in Table 1 must be of the color specified for that telltale in column 6 of that table.

S5.4.2 Any indicator or telltale not listed in Table 1 and any identification of that indicator or telltale must not be a color that masks the driver's ability to recognize any telltale, control, or indicator listed in Table 1.

S5.4.3 Each identifier used for the identification of a telltale, control or indicator must be in a color that stands out clearly against the background. However,

this requirement does not apply to an identifier for a horn control in the center of the face plane of the steering wheel hub. For vehicles with a GVWR of under 4,536 kg (10,000 pounds), the compliance date for this provision is September 1, 2011. For vehicles with a GVWR of 4,536 kg (10,000 pounds) or over, the compliance date for this provision is September 1, 2013.

S5.4.4 The filled-in part of any symbol in Table 1 or Table 2 may be replaced by its outline and the outline of any symbol in Table 1 or Table 2 may be filled in.

S5.5 Common space for displaying multiple messages

S5.5.1 A common space may be used to show messages from any sources, subject to the requirements in S5.5.2 through S5.5.6.

S5.5.2 The telltales for any brake system malfunction required by Table 1 to be red, air bag malfunction, low tire pressure, electronic stability control malfunction (as of September 1, 2011), passenger air bag off, high beam, turn signal, and seat belt must not be shown in the same common space.

S5.5.3 The telltales and indicators that are listed in Table 1 and are shown in the common space must illuminate at the initiation of any underlying condition.

S5.5.4 Except as provided in S5.5.5, when the underlying conditions exist for actuation of two or more telltales, the messages must be either:

(a) Repeated automatically in sequence, or

(b) Indicated by visible means and capable of being selected for viewing by the driver under the conditions of S5.6.2.

S5.5.5 In the case of the telltale for a brake system malfunction, air bag malfunction, side air bag malfunction, low tire pressure, electronic stability control malfunction (as of September 1, 2011), passenger air bag off, high beam, turn signal, or seat belt that is designed to display in a common space, that telltale must displace any other symbol or message in that common space while the underlying condition for the telltale's activation exists.

S5.5.6(a) Except as provided in S5.5.6(b), messages displayed in a common space may be cancelable automatically or by the driver.

(b) Telltales for high beams, turn signal, low tire pressure, and passenger air bag off, and telltales for which the color red is required in Table 1 must not be cancelable while the underlying condition for their activation exists.

S5.6 Conditions

S5.6.1 The driver has adapted to the ambient light roadway conditions.

S5.6.2 The driver is restrained by the seat belts installed in accordance with 49 CFR 571.208 and adjusted in accordance with the vehicle manufacturer's instructions.

Notes:

1. An identifier is shown in this table if it is required for a control for which an illumination requirement exists or if it is used for a telltale for which a color requirement exists. If a line appears in column 2 and column 3, the control, telltale or indicator is required to be identified, however the form of the identification is the manufacturer's option. Telltales are not considered to have an illumination requirement, because by definition the telltale must light when the condition for its activation exists.
2. Additional requirements in FMVSS 108.
3. Framed areas of the symbol may be solid; solid areas may be framed.
4. Blue may be blue-green. Red may be red-orange.
5. Symbols employing four lines instead of five may also be used.
6. The pair of arrows is a single symbol. When the controls or telltales for left and right turn operate independently, however, the two arrows may be considered separate symbols and be spaced accordingly.
7. Not required when arrows of turn signal telltales that otherwise operate independently flash simultaneously as hazard warning telltale.
8. Separate identification not required if function is combined with master lighting switch.
9. Refer to FMVSS 105 or FMVSS 135, as appropriate, for additional specific requirements for brake telltale labeling and color. If a single telltale is used to indicate more than one brake system condition, the brake system malfunction identifier must be used.
10. Requirement effective September 1, 2011.
11. This symbol may also be used to indicate the malfunction of related systems/functions, including traction control, trailer stability assist, corner brake control, and other similar functions that use throttle and/or individual wheel torque control to operate and share common components with ESC.
12. Combination of the engine oil pressure symbol and the engine coolant temperature symbol in a single telltale is permitted.
13. Use when engine control is separate from the key locking system.
14. If the speedometer is graduated in both miles per hour and in kilometers per hour, the scales must be identified "MPH" and "km/h", respectively, in any combination of upper- and lowercase letters.
15. The letters 'P', 'R', 'N', and 'D' are considered separate identifiers for the individual gear positions. Their locations within the vehicle, and with respect to each other, are governed by FMVSS 102. The letter 'D' may be replaced by another alphanumeric character or symbol chosen by the manufacturer.
16. Required only for FMVSS 138 compliant vehicles.
17. Alternatively, either low tire pressure telltale may be used to indicate a TPMS malfunction. See FMVSS 138.
18. Required only for vehicles manufactured on or after September 1, 2007.

2. Any combination of upper- or lowercase letters may be used.
3. Framed areas may be filled.
4. If a line appears in Column 2 and Column 3, the Control, Telltale or Indicator is required to be identified, however the form of the identification is the manufacturer's option.
5. Separate identification not required if function is combined with Master Lighting Switch

Vehicle Maintenance Pro

§571.102 Standard No. 102; Transmission shift position sequence, starter interlock, and transmission braking effect.

S1. Purpose and scope. This standard specifies the requirements for the transmission shift position sequence, a starter interlock, and for a braking effect of automatic transmissions, to reduce the likelihood of shifting errors, to prevent starter engagement by the driver when the transmission is in any drive position, and to provide supplemental braking at speeds below 40 kilometers per hour (25 miles per hour).

S2. Application. This standard applies to passenger cars, multi-purpose passenger vehicles, trucks, and buses.

S3. Requirements.

S3.1 Automatic transmissions.

S3.1.1 Location of transmission shift positions on passenger cars. A neutral position shall be located between forward drive and reverse drive positions.

S3.1.1.1 Transmission shift levers. If a steering-column-mounted transmission shift lever is used, movement from neutral position to forward drive position shall be clockwise. If the transmission shift lever sequence includes a park position, it shall be located at the end, adjacent to the reverse drive position.

S3.1.2 Transmission braking effect. In vehicles having more than one forward transmission gear ratio, one forward drive position shall provide a greater degree of engine braking than the highest speed transmission ratio at vehicle speeds below 40 kilometers per hour (25 miles per hour).

S3.1.3 Starter interlock. Except as provided in S3.1.3.1 through S3.1.3.3, the engine starter shall be inoperative when the transmission shift position is in a forward or reverse drive position.

S3.1.3.1 After the driver has activated the vehicle's propulsion system:

(a) The engine may stop and restart automatically when the transmission shift position is in any forward drive gear;

(b) The engine may not automatically stop when the transmission is in reverse gear; and

(c) The engine may automatically restart in reverse gear only if the vehicle satisfies (1) and (2):

(1) When the engine is automatically stopped in a forward drive shift position and the driver selects Reverse, the engine restarts immediately whenever the service brake is applied.

(2) When the engine is automatically stopped in a forward drive shift position and the driver selects Reverse, the engine does not start automatically if the service brake is not applied.

S3.1.3.2 Notwithstanding S3.1.3.1, the engine may stop and start at any time after the driver has activated the vehicle's propulsion system if the vehicle can meet the requirements specified in paragraphs (a) and (b):

(a) For passenger cars, multi-purpose passenger vehicles, trucks and buses with a GVWR less than or equal to 4,536 kg (10,000 pounds), the vehicle's propulsion system can propel the vehicle in the normal travel mode in all forward and reverse drive gears without the

engine operating. For passenger cars, multipurpose passenger vehicles, trucks and buses with a GVWR greater than 4,536 kg (10,000 pounds), the vehicle's propulsion system can propel the vehicle in the normal travel mode in Reverse and at least one forward drive gear without the engine operating.

(b) If the engine automatically starts while the vehicle is traveling at a steady speed and steady accelerator control setting, the engine does not cause the vehicle to accelerate.

S3.1.3.3 If the transmission shift position is in Park, automatically stopping or restarting the engine shall not take the transmission out of Park.

S3.1.4 Identification of shift positions and of shift position sequence.

S3.1.4.1 Except as specified in S3.1.4.3, if the transmission shift position sequence includes a park position, identification of shift positions, including the positions in relation to each other and the position selected, shall be displayed in view of the driver whenever any of the following conditions exist:

(a) The ignition is in a position where the transmission can be shifted; or

(b) The transmission is not in park.

S3.1.4.2 Except as specified in S3.1.4.3, if the transmission shift position sequence does not include a park position, identification of shift positions, including the positions in relation to each other and the position selected, shall be displayed in view of the driver whenever the ignition is in a position in which the engine is capable of operation.

S3.1.4.3 Such information need not be displayed when the ignition is in a position that is used only to start the vehicle.

S3.1.4.4 All of the information required to be displayed by S3.1.4.1 or S3.1.4.2 shall be displayed in view of the driver in a single location. At the option of the manufacturer, redundant displays providing some or all of the information may be provided.

S3.2 Manual transmissions. Identification of the shift lever pattern of manual transmissions, except three forward speed manual transmissions having the standard "H" pattern, shall be displayed in view of the driver at all times when a driver is present in the driver's seating position.

§571.103 Standard No. 103; Windshield defrosting and defogging systems.

S1. Scope. This standard specifies requirements for windshield defrosting and defogging systems.

S2. Application. This standard applies to passenger cars, multipurpose passenger vehicles, trucks, and buses.

S3. Definitions. Road load means the power output required to move a given motor vehicle at curb weight plus 180 kilograms on level, clean, dry, smooth portland cement concrete pavement (or other surface with equivalent coefficient of surface friction) at a specified speed through still air at 20 degrees Celsius, and standard barometric pressure (101.3 kilopascals) and includes driveline friction, rolling friction, and air resistance.

Regulations

S4. Requirements. (a) Except as provided in paragraph (b) of this section, each passenger car shall meet the requirements specified in S4.1, S4.2, and S4.3, and each multipurpose passenger vehicle, truck, and bus shall meet the requirements specified in S4.1.

(b) Each passenger car, multipurpose passenger vehicle, truck, and bus manufactured for sale in the noncontinental United States may, at the option of the manufacturer, have a windshield defogging system which operates either by applying heat to the windshield or by dehumidifying the air inside the passenger compartment of the vehicle, in lieu of meeting the requirements specified by paragraph (a) of this section.

S4.1 Each vehicle shall have a windshield defrosting and defogging system.

S4.2 Each passenger car windshield defrosting and defogging system shall meet the requirements of section 3 of SAE Recommended Practice J902 (1964) (incorporated by reference, see §571.5) when tested in accordance with S4.3, except that “the critical area” specified in paragraph 3.1 of SAE Recommended Practice J902 (1964) shall be that established as Area C in accordance with Motor Vehicle Safety Standard No. 104, “Windshield Wiping and Washing Systems,” and “the entire windshield” specified in paragraph 3.3 of SAE Recommended Practice J902 (1964) shall be that established as Area A in accordance with §571.104.

S4.3 Demonstration procedure. The passenger car windshield defrosting and defogging system shall be tested in accordance with the portions of paragraphs 4.1 through 4.4.7 of SAE Recommended Practice J902 (1964) or SAE Recommended Practice J902a (1967) (both incorporated by reference, see §571.5) applicable to that system, except that—

(a) During the first 5 minutes of the test:

(1) For a passenger car equipped with a heating system other than a heat exchanger type that uses the engine’s coolant as a means to supply the heat to the heat exchanger, the warm-up procedure is that specified by the vehicle’s manufacturer for cold weather starting, except that connection to a power or heat source external to the vehicle is not permitted.

(2) For all other passenger cars, the warm-up procedure may be that recommended by the vehicle’s manufacturer for cold weather starting.

(b) During the last 35 minutes of the test period (or the entire test period if the 5-minute warm-up procedure specified in paragraph (a) of this section is not used),

(1) For a passenger car equipped with a heating system other than a heat exchanger type that uses the engine’s coolant as a means to supply the heat to the heat exchanger, the procedure shall be that specified by the vehicle’s manufacturer for cold weather starting, except that connection to a power or heat source external to the vehicle is not permitted.

(2) For all other passenger cars, either—

(i) The engine speed shall not exceed 1,500 r.p.m. in neutral gear; or

(ii) The engine speed and load shall not exceed the speed and load at 40 kilometers per hour in the manufacturer’s recommended gear with road load;

(c) A room air change of 90 times per hour is not required;

(d) The windshield wipers may be used during the test if they are operated without manual assist;

(e) One or two windows may be open a total of 25 millimeters;

(f) The defroster blower may be turned on at any time; and

(g) The wind velocity is at any level from 0 to 3 kilometers per hour.

(h) The test chamber temperature and the wind velocity shall be measured, after the engine has been started, at the forwardmost point of the vehicle or a point 914 millimeters from the base of the windshield, whichever is farther forward, at a level halfway between the top and bottom of the windshield on the vehicle centerline.

§571.104 Standard No. 104; Windshield wiping and washing systems.

S1. Scope. This standard specifies requirements for windshield wiping and washing systems.

S2. Application. This standard applies to passenger cars, multipurpose passenger vehicles, trucks, and buses.

S3. Definitions. The term seating reference point is substituted for the terms manikin H point, manikin H point with seat in rearmost position and H point wherever any of these terms appear in any SAE Standard or SAE Recommended Practice referred to in this standard.

Daylight opening means the maximum unobstructed opening through the glazing surface, as defined in paragraph 2.3.12 of section E, “Ground Vehicle Practice,” of SAE Aerospace-Automotive Drawing Standards (1963) (incorporated by reference, see §571.5).

Glazing surface reference line means the line resulting from the intersection of the glazing surface and a horizontal plane 635 millimeters above the seating reference point, as shown in Figure 1 of SAE Recommended Practice J903a (1966) (incorporated by reference, see §571.5).

Overall width means the maximum overall body width dimension “W116”, as defined in section E, “Ground Vehicle Practice,” of SAE Aerospace-Automotive Drawing Standards (1963) (incorporated by reference, see §571.5).

Plan view reference line means—

(a) For vehicles with bench-type seats, a line parallel to the vehicle longitudinal centerline outboard of the steering wheel centerline 0.15 times the difference between one-half of the shoulder room dimension and the steering wheel centerline-to-car-centerline dimension as shown in Figure 2 of SAE Recommended Practice J903a (1966) (incorporated by reference, see §571.5); or

(b) For vehicles with individual-type seats, either—

(i) A line parallel to the vehicle longitudinal centerline which passes through the center of the driver’s designated seating position; or

(ii) A line parallel to the vehicle longitudinal centerline located so that the geometric center of the 95 percent eye range contour is positioned on the longitudinal centerline of the driver’s designated seating position.

Vehicle Maintenance Pro

Shoulder room dimension means the front shoulder room dimension “W3” as defined in section E, “Ground Vehicle Practice,” of SAE Aerospace-Automotive Drawing Standards (1963) (incorporated by reference, see §571.5).

95 percent eye range contour means the 95th percentile tangential cutoff specified in SAE Recommended Practice J941 (1965) (incorporated by reference, see §571.5).

S4. Requirements.

S4.1 Windshield wiping system. Each vehicle shall have a power-driven windshield wiping system that meets the requirements of S4.1.1.

S4.1.1 Frequency.

S4.1.1.1 Each windshield wiping system shall have at least two frequencies or speeds.

S4.1.1.2 One frequency or speed shall be at least 45 cycles per minute regardless of engine load and engine speed.

S4.1.1.3 Regardless of engine speed and engine load, the highest and one lower frequency or speed shall differ by at least 15 cycles per minute. Such lower frequency or speed shall be at least 20 cycles per minute regardless of engine speed and engine load.

S4.1.1.4 Compliance with subparagraphs S4.1.1.2 and S4.1.1.3 may be demonstrated by testing under the conditions specified in sections 4.1.1 and 4.1.2 of SAE Recommended Practice J903a (1966) (incorporated by reference, see §571.5).

S4.1.2 Wiped area. When tested wet in accordance with SAE Recommended Practice J903a (1966) (incorporated by reference, see §571.5), each passenger car windshield wiping system shall wipe the percentage of Areas A, B, and C of the windshield (established in accordance with S4.1.2.1) that (1) is specified in column 2 of the applicable table following subparagraph S4.1.2.1 and (2) is within the area bounded by a perimeter line on the glazing surface 25 millimeters from the edge of the daylight opening.

S4.1.2.1 A, B, and C shall be established as shown in Figures 1 and 2 of SAE Recommended Practice J903a (1966) (incorporated by reference, see §571.5) using the angles specified in Columns 3 through 6 of Table I, II, III, or IV, as applicable.

S4.2 Windshield washing system.

S4.2.1 Each passenger car shall have a windshield washing system that meets the requirements of SAE Recommended Practice J942 (1965) (incorporated by reference, see §571.5), except that the reference to “the effective wipe pattern defined in SAE J903, paragraph 3.1.2” in paragraph 3.1 of SAE Recommended Practice J942 (1965) shall be deleted and “the areas established in accordance with subparagraph S4.1.2.1 of Motor Vehicle Safety Standard No. 104” shall be inserted in lieu thereof.

S4.2.2 Each multipurpose passenger vehicle, truck, and bus shall have a windshield washing system that meets the requirements of SAE Recommended Practice J942 (1965) (incorporated by reference, see §571.5), except that the reference to “the effective wipe pattern defined in SAE J903, paragraph 3.1.2” in paragraph 3.1 of SAE

Recommended Practice J942 (1965) shall be deleted and “the pattern designed by the manufacturer for the windshield wiping system on the exterior surface of the windshield glazing” shall be inserted in lieu thereof.

§571.105 Standard No. 105; Hydraulic and electric brake systems.

S1. Scope. This standard specifies requirements for hydraulic and electric service brake systems, and associated parking brake systems.

S2. Purpose. The purpose of this standard is to insure safe braking performance under normal and emergency conditions.

S3. Application. This standard applies to multipurpose passenger vehicles, trucks, and buses with a

Regulations

GVWR greater than 3,500 kilograms (7,716 pounds) that are equipped with hydraulic or electric brake systems.

S4. Definitions.

Antilock brake system or ABS means a portion of a service brake system that automatically controls the degree of rotational wheel slip during braking by:

- (1) Sensing the rate of angular rotation of the wheels;
- (2) Transmitting signals regarding the rate of wheel angular rotation to one or more controlling devices which interpret those signals and generate responsive controlling output signals; and

- (3) Transmitting those controlling signals to one or more modulators which adjust brake actuating forces in response to those signals.

Backup system means a portion of a service brake system, such as a pump, that automatically supplies energy, in the event of a primary brake power source failure.

Brake power assist unit means a device installed in a hydraulic brake system that reduces the operator effort required to actuate the system, and that if inoperative does not prevent the operator from braking the vehicle by a continued application of muscular force on the service brake control.

Brake power unit means a device installed in a brake system that provides the energy required to actuate the brakes, either directly or indirectly through an auxiliary device, with the operator action consisting only of modulating the energy application level.

Directly Controlled Wheel means a wheel for which the degree of rotational wheel slip is sensed, either at that wheel or on the axle shaft for that wheel and corresponding signals are transmitted to one or more modulators that adjust the brake actuating forces at that wheel. Each modulator may also adjust the brake actuating forces at other wheels that are on the same axle or in the same axle set in response to the same signal or signals.

Electric vehicle or EV means a motor vehicle that is powered by an electric motor drawing current from rechargeable storage batteries, fuel cells, or other portable sources of electrical current, and which may include a non-electrical source of power designed to charge batteries and components thereof.

Electrically-actuated service brakes means service brakes that utilize electrical energy to actuate the foundation brakes.

Full brake application means a brake application in which the force on the brake pedal reaches 150 pounds within 0.3 seconds from the point of application of force to the brake control.

Hydraulic brake system means a system that uses hydraulic fluid as a medium for transmitting force from a service brake control to the service brake, and that may incorporate a brake power assist unit, or a brake power unit.

Indirectly Controlled Wheel means a wheel at which the degree of rotational wheel slip is not sensed, but at which the modulator of an antilock braking system adjusts its brake actuating forces in response to signals from one or more sensed wheels.

Initial brake temperature means the average temperature of the service brakes on the hottest axle of the vehicle 0.2 mi before any brake application.

Lightly loaded vehicle weight means:

- (a) For vehicles with a GVWR of 10,000 lbs. or less, unloaded vehicle weight plus 400 lbs. (including driver and instrumentation);

- (b) For vehicles with a GVWR greater than 10,000 lbs., unloaded vehicle weight plus 500 lbs. (including driver and instrumentation).

Maximum drive-through speed means the highest possible constant speed at which the vehicle can be driven through 200 feet of a 500-foot radius curve arc without leaving the 12-foot lane.

Parking mechanism means a component or subsystem of the drive train that locks the drive train when the transmission control is placed in a parking or other gear position and the ignition key is removed.

Peak friction coefficient or PFC means the ratio of the maximum value of braking test wheel longitudinal force to the simultaneous vertical force occurring prior to wheel lockup, as the braking torque is progressively increased.

Pressure component means a brake system component that contains the brake system fluid and controls or senses the fluid pressure.

Regenerative braking system or RBS means an electrical energy system that is installed in an EV for recovering or dissipating kinetic energy, and which uses the propulsion motor(s) as a retarder for partial braking of the EV while returning electrical energy to the propulsion batteries or dissipating electrical energy.

Skid number means the frictional resistance of a pavement measured in accordance with ASTM E274-70 (incorporated by reference, see §571.5) at 40 mph, omitting water delivery as specified in paragraphs 7.1 and 7.2 of that method.

Snub means the braking deceleration of a vehicle from a higher reference speed to a lower reference speed that is greater than zero.

Spike stop means a stop resulting from the application of 200 lbs of force on the service brake control in 0.08 s.

Split service brake system means a brake system consisting of two or more subsystems actuated by a single control, designed so that a single failure in any subsystem (such as a leakage-type failure of a pressure component of a hydraulic subsystem except structural failure of a housing that is common to two or more subsystems, or an electrical failure in an electric subsystem) does not impair the operation of any other subsystem.

Stopping distance means the distance traveled by a vehicle from the point of application of force to the brake control to the point at which the vehicle reaches a full stop.

Tandem axle means a group of two or more axles placed in close arrangement one behind the other with the center lines of adjacent axles not more than 72 inches apart.

Variable proportioning brake system means a system that automatically adjusts the braking force at the axles to compensate for vehicle static axle loading

Vehicle Maintenance Pro

Reserved

Regulations

and/or dynamic weight transfer between axles during deceleration.

Wheel lockup means 100 percent wheel slip.

S5. Requirements.

S5.1 Service brake systems. Each vehicle must be equipped with a service brake system acting on all wheels. Wear of the service brake must be compensated for by means of a system of automatic adjustment. Each passenger car and each multipurpose passenger vehicle, truck, and bus with a GVWR of 10,000 pounds or less must be capable of meeting the requirements of S5.1.1 through S5.1.6 under the conditions prescribed in S6, when tested according to the procedures and in the sequence set forth in S7. Each school bus with a GVWR greater than 10,000 pounds must be capable of meeting the requirements of S5.1.1 through S5.1.5, and S5.1.7 under the conditions specified in S6, when tested according to the procedures and in the sequence set forth in S7. Each multipurpose passenger vehicle, truck and bus (other than a school bus) with a GVWR greater than 10,000 pounds must be capable of meeting the requirements of S5.1.1, S5.1.2, S5.1.3, and S5.1.7 under the conditions specified in S6, when tested according to the procedures and in the sequence set forth in S7. Except as noted in S5.1.1.2 and S5.1.1.4, if a vehicle is incapable of attaining a speed specified in S5.1.1, S5.1.2, S5.1.3, or S5.1.6, its service brakes must be capable of stopping the vehicle from the multiple of 5 mph that is 4 to 8 mph less than the speed attainable in 2 miles, within distances that do not exceed the corresponding distances specified in Table II. If a vehicle is incapable of attaining a speed specified in S5.1.4 in the time or distance interval set forth, it must be tested at the highest speed attainable in the time or distance interval specified.

S5.1.1 Stopping distance.

(a) The service brakes shall be capable of stopping each vehicle with a GVWR of less than 8,000 pounds, and each school bus with a GVWR between 8,000 pounds and 10,000 pounds in four effectiveness tests within the distances and from the speeds specified in S5.1.1.1, S5.1.1.2, S5.1.1.3, and S5.1.1.4.

(b) The service brakes shall be capable of stopping each vehicle with a GVWR of between 8,000 pounds and 10,000 pounds, other than a school bus, in three effectiveness tests within the distances and from the speeds specified in S5.1.1.1, S5.1.1.2, and S5.1.1.4.

(c) The service brakes shall be capable of stopping each vehicle with a GVWR greater than 10,000 pounds in two effectiveness tests within the distances and from the speeds specified in S5.1.1.2 and S5.1.1.3. Each school bus with a GVWR greater than 10,000 pounds manufactured after January 12, 1996 and before March 1, 1999 and which is equipped with an antilock brake system may comply with paragraph S5.1.1.2 and S5.1.1.3 rather than the first effectiveness test, as specified in S5.1.1.1. Each school bus with a GVWR greater than 10,000 pounds manufactured on or after March 1, 1999 shall be capable of meeting the requirements of S5.1.1 through S5.1.5, under the conditions prescribed in S6, when tested according to the procedures and in the sequence set forth in S7.

S5.1.1.1 In the first (preburnished) effectiveness test, the vehicle shall be capable of stopping from 30 mph and 60 mph within the corresponding distances specified in Column I of Table II.

S5.1.1.2 In the second effectiveness test, each vehicle with a GVWR of 10,000 pounds or less and each school bus with a GVWR greater than 10,000 pounds shall be capable of stopping from 30 mph and 60 mph, and each vehicle with a GVWR greater than 10,000 pounds (other than a school bus) shall be capable of stopping from 60 mph, within the corresponding distances specified in Column II of Table II. If the speed attainable in 2 miles is not less than 84 mph, a passenger car or other vehicle with a GVWR of 10,000 pounds or less shall also be capable of stopping from 80 mph within the corresponding distances specified in Column II of Table II.

S5.1.1.3 In the third effectiveness test the vehicle shall be capable of stopping at lightly loaded vehicle weight from 60 mph within the corresponding distance specified in Column III of Table II.

S5.1.1.4 In the fourth effectiveness test, a vehicle with a GVWR of 10,000 pounds or less shall be capable of stopping from 30 and 60 mph within the corresponding distances specified in Column I of Table II. If the speed attainable in 2 miles is not less than 84 mph, a passenger car, or other vehicle with a GVWR of 10,000 lbs., or less, shall also be capable of stopping from 80 mph within the corresponding distance specified in Column I of Table II.

If the speed attainable in 2 miles is not less than 99 mph, a passenger car shall, in addition, be capable of stopping from the applicable speed indicated below, within the corresponding distance specified in Column I of Table II.

Speed attainable in 2 miles (mph)	Required to stop from (mph)
Not less than 99 but less than 104	95
104 or more	100

For an EV, the speed attainable in 2 miles is determined with the propulsion batteries at a state of charge of not less than 95 percent at the beginning of the run.

S5.1.2 Partial failure.

S5.1.2.1 In vehicles manufactured with a split service brake system, in the event of a rupture or leakage type of failure in a single subsystem, other than a structural failure of a housing that is common to two or more subsystems, the remaining portion(s) of the service brake system shall continue to operate and shall be capable of stopping a vehicle from 60 mph within the corresponding distance specified in Column IV of Table II.

S5.1.2.2 In vehicles not manufactured with a split service brake system, in the event of any one rupture or leakage type of failure in any component of the service brake system the vehicle shall, by operation of the service brake control, be capable of stopping 10 times consecutively from 60 mph within the corresponding distance specified in Column IV of Table II.

S5.1.2.3 For a vehicle manufactured with a service brake system in which the brake signal is transmitted

Vehicle Maintenance Pro

electrically between the brake pedal and some or all of the foundation brakes, regardless of the means of actuation of the foundation brakes, the vehicle shall be capable of stopping from 60 mph within the corresponding distance specified in Column IV of Table II with any single failure in any circuit that electrically transmits the brake signal, and with all other systems intact.

S5.1.2.4 For an EV manufactured with a service brake system that incorporates RBS, the vehicle shall be capable of stopping from 60 mph within the corresponding distance specified in Column IV of Table II with any single failure in the RBS, and with all other systems intact.

S5.1.3 Inoperative brake power assist unit or brake power unit. A vehicle equipped with one or more brake power assist units shall meet the requirements of either S5.1.3.1, S5.1.3.2, or S5.1.3.4 (chosen at the option of the manufacturer), and a vehicle equipped with one or more brake power units shall meet the requirements of either S5.1.3.1, S5.1.3.3, or S5.1.3.4 (chosen at the option of the manufacturer).

S5.1.3.1 The service brakes on a vehicle equipped with one or more brake power assist units or brake power units, with one such unit inoperative and depleted of all reserve capability, shall be capable of stopping a vehicle from 60 mph within the corresponding distance specified in Column IV of Table II.

S5.1.3.2 **Brake power assist units.** The service brakes on a vehicle equipped with one or more brake power assist units, with one such unit inoperative, shall be capable of stopping a vehicle from 60 mph:

(a) In six consecutive stops at an average deceleration for each stop that is not lower than that specified in column I of table III, when the inoperative unit is not initially depleted of all reserve capability; and

(b) In a final stop, at an average deceleration that is not lower than 7 FPSPS for passenger cars (equivalent stopping distance 554 feet) or 6 FPSPS for vehicles other than passenger cars (equivalent stopping distance 646 feet), as applicable, when the inoperative unit is depleted of all reserve capacity.

S5.1.3.3 **Brake power units.** The service brakes of a vehicle equipped with one or more brake power units with an accumulator-type reserve system, with any one failure in any one unit shall be capable of stopping the vehicle from 60 mph—

(a) In 10 consecutive stops at an average deceleration for each stop that is not lower than that specified in Column II of Table III, when the unit is not initially depleted of all reserve capability; and

(b) In a final stop, at an average deceleration that is not lower than 7 FPSPS for passenger cars (equivalent stopping distance 554 feet) or 6 FPSPS for vehicles other than passenger cars (equivalent stopping distance 646 feet), as applicable, when the inoperative unit is depleted of all reserve capacity.

S5.1.3.4 **Brake power assist and brake power units.** The service brakes of a vehicle equipped with one or more brake power assist units or brake power units with a backup system, with one brake power assist unit or brake power unit inoperative and depleted of all

reserve capability and with only the backup system operating in the failed subsystem, shall be capable of stopping the vehicle from 60 mph in 15 consecutive stops at an average deceleration for each stop that is not lower than 12 fpsps (equivalent stopping distance 323 feet).

S5.1.3.5 **Electric brakes.** Each vehicle with electrically-actuated service brakes (brake power unit) shall comply with the requirements of S5.1.3.1 with any single electrical failure in the electrically-actuated service brakes and all other systems intact.

S5.1.4 **Fade and recovery.** The service brakes shall be capable of stopping each vehicle in two fade and recovery tests as specified below.

S5.1.4.1 The control force used for the baseline check stops or snubs shall be not less than 10 pounds, nor more than 60 pounds, except that the control force for a vehicle with a GVWR of 10,000 pounds or more may be between 10 pounds and 90 pounds.

S5.1.4.2(a) Each vehicle with GVWR of 10,000 lbs or less shall be capable of making 5 fade stops (10 fade stops on the second test) from 60 mph at a deceleration not lower than 15 fpsps for each stop, followed by 5 fade stops at the maximum deceleration attainable from 5 to 15 fpsps.

(b) Each vehicle with a GVWR greater than 10,000 pounds shall be capable of making 10 fade snubs (20 fade snubs on the second test) from 40 mph to 20 mph at 10 fpsps for each snub.

S5.1.4.3(a) Each vehicle with a GVWR of 10,000 pounds or less shall be capable of making five recovery stops from 30 mph at 10 fpsps for each stop, with a control force application that falls within the following maximum and minimum limits:

(1) A maximum for the first four recovery stops of 150 pounds, and for the fifth stop, of 20 pounds more than the average control force for the baseline check; and

(2) A minimum of—

(A) The average control force for the baseline check minus 10 pounds, or

(B) The average control force for the baseline check times 0.60, whichever is lower (but in no case lower than 5 pounds).

(b) Each vehicle with a GVWR of more than 10,000 pounds shall be capable of making five recovery snubs from 40 mph to 20 mph at 10 fpsps for each snub, with a control force application that falls within the following maximum and minimum limits:

(1) A maximum for the first four recovery snubs of 150 pounds, and for the fifth snub, of 20 pounds more than the average control force for the baseline check (but in no case more than 100 pounds); and

(2) A minimum of—

(A) The average control force for the baseline check minus 10 pounds, or

(B) The average control force for the baseline check times 0.60, whichever is lower (but in no case lower than 5 pounds).

Regulations

S5.1.5 Water recovery. The service brakes shall be capable of stopping each vehicle in a water recovery test, as specified below.

S5.1.5.1 The control force used for the baseline check stops or snubs shall be not less than 10 pounds, nor more than 60 pounds, except that the control force for a vehicle with a GVWR of 10,000 pounds or more may be between 10 and 90 pounds.

S5.1.5.2 (a) After being driven for 2 minutes at a speed of 5 mph in any combination of forward and reverse directions through a trough having a water dept of 6 inches, each vehicle with a GVWR of 10,000 pounds or less shall be capable of making five recovery stops from 30 mph at ten fpsps for each stop with a control force application that falls within the following maximum and minimum limits:

(1) A maximum for the first four recovery stops of 150 pounds, and for the fifth stop, of 45 pounds more than the average control force for the baseline check (but in no case more than 90 pounds, except that the maximum control force for the fifth stop in the case of a vehicle manufactured before September 1, 1976, shall be not more than plus 60 pounds of the average control force for the baseline check (but in no case more than 110 pounds).

(2) A minimum of-

(A) The average control force for the baseline check minus 10 pounds, or

(B) The average control force for the

baseline check times 0.60, whichever is lower (but in no case lower than 5 pounds).

(b) After being driven for 2 minutes at a speed of 5 mph in any combination of forward and reverse directions through a trough having a water depth of 6 inches, each vehicle with a GVWR of more than 10,000 pounds shall be capable of making five recovery stops from 30 mph at 10 fpsps for each stop with a control force application that falls within the following maximum and minimum limits:

(1) A maximum for the first four recovery stops of 150 pounds, and for the fifth stop, of 60 pounds more than the average control force for the baseline

check (but in no case more than 110 pounds); and

(2) A minimum of-

(A) The average control force for the baseline check minus 10 pounds, or

(B) The average control force for the

baseline check times 0.60, whichever is lower (but in no case lower than 5 pounds).

S5.1.6 Spike stops. Each vehicle with a GVWR of 10,000 lbs. or less shall be capable of making 10 spike stops from 30 mph, followed by 6 effectiveness (check) stops from 60 mph, at least one of which shall be within a corresponding stopping distance specified in column I of table II.

S5.1.7 Stability and control during braking. When stopped four consecutive times under the conditions specified in S6, each vehicle with a GVWR greater than 10,000 pounds manufactured on or after July 1, 2005 and each vehicle with a GVWR greater than 10,000 pounds manufactured in two or more stages on or after July 1, 2006

shall stop from 30 mph or 75 percent of the maximum drive-through speed, whichever is less, at least three times within the 12-foot lane, without any part of the vehicle leaving the roadway. Stop the vehicle with the vehicle at its lightly loaded vehicle weight, or at the manufacturer's option, at its lightly loaded vehicle weight plus not more than an additional 1000 pounds for a roll bar structure on the vehicle.

S5.2 Parking Brake System. Each vehicle shall be manufactured with a parking brake system of a friction type with a solely mechanical means to retain engagement, which shall under the conditions of S6, when tested according to the procedures specified in S7, meet the requirements specified in S5.2.1, S5.2.2, or S5.2.3 as appropriate, with the system engaged-

(a) In the case of a vehicle with a GVWR of 4,536 kilograms (10,000 pounds) or less, with a force applied to the control not to exceed 125 pounds for a foot-operated system and 90 pounds for a hand-operated system; and

(b) In the case of a vehicle with a GVWR greater than 4,536 kilograms (10,000 pounds), with a force applied to the control not to exceed 150 pounds for a foot-operated system and 125 pounds for a hand-operated system.

S5.2.1. Except as provided in §5.2.2, the parking brake system on a passenger car and on a school bus with a GVWR of 10,000 pounds or less shall be capable of holding the vehicle stationary (to the limit of traction on the braked wheels) for 5 minutes in both a forward and reverse direction on a 30 percent grade.

S5.2.2 A vehicle of a type described in S5.2.1 at the option of the manufacturer may meet the requirements of S5.2.2.1, S5.2.2.2, and S5.2.2.3 instead of the requirements of S5.2.1 if:

(a) The vehicle has a transmission or transmission control which incorporates a parking mechanism, and

(b) The parking mechanism must be engaged before the ignition key can be removed.

S5.2.2.1 The vehicle's parking brake and parking mechanism, when both are engaged, shall be capable of holding the vehicle stationary (to the limit of traction of the braked wheels) for 5 minutes, in both forward and reverse directions, on a 30 percent grade.

S5.2.2.2 The vehicle's parking brake, with the parking mechanism not engaged, shall be capable of holding the vehicle stationary for 5 minutes, in both forward and reverse directions, on a 20 percent grade.

S5.2.2.3 With the parking mechanism engaged and the parking brake not engaged, the parking mechanism shall not disengage or fracture in a manner permitting vehicle movement, when the vehicle is impacted at each end, on a level surface, by a barrier moving at 2½ mph.

S5.2.3 (a) The parking brake system on a multipurpose passenger vehicle, truck or bus (other than a school bus) with a GVWR of 4,536 kilograms (10,000 pounds) or less shall be capable of holding the vehicle stationary for 5 minutes, in both forward and reverse directions, on a 20 percent grade.

(b) The parking brake system on a multipurpose passenger vehicle, truck, or bus (including a school bus) with a GVWR greater than 4,536 kilograms (10,000 pounds) shall be capable of holding the vehicle stationary for 5

Vehicle Maintenance Pro

minutes, in both forward and reverse directions, on a 20 percent grade.

S5.3 Brake system indicator lamp. Each vehicle shall have a brake system indicator lamp or lamps, mounted in front of and in clear view of the driver, which meet the requirements of S5.3.1 through S5.3.5. A vehicle with a GVWR of 10,000 pounds or less may have a single common indicator lamp. A vehicle with a GVWR of greater than 10,000 pounds may have an indicator lamp which is common for gross loss of pressure, drop in the level of brake fluid, or application of the parking brake, but shall have a separate indicator lamp for antilock brake system malfunction. However, the options provided in S5.3.1(a) shall not apply to a vehicle manufactured without a split service brake system; such a vehicle shall, to meet the requirements of S5.3.1(a), be equipped with a malfunction indicator that activates under the conditions specified in S5.3.1(a)(4). This warning indicator shall, instead of meeting the requirements of S5.3.2 through S5.3.5, activate (while the vehicle remains capable of meeting the requirements of S5.1.2.2 and the ignition switch is in the “on” position) a continuous or intermittent audible signal and a flashing warning light, displaying the words “STOP-BRAKE FAILURE” in block capital letters not less than one-quarter of an inch in height.

S5.3.1 An indicator lamp shall be activated when the ignition (start) switch is in the “on” (“run”) position and whenever any of the conditions (a) or (b), (c), (d), (e), (f), and (g) occur:

(a) A gross loss of pressure (such as caused by rupture of a brake line but not by a structural failure of a housing that is common to two or more subsystems) due to one of the following conditions (chosen at the option of the manufacturer):

(1) Before or upon application of a differential pressure of not more than 225 lb/in² between the active and failed brake system measured at a master cylinder outlet or a slave cylinder outlet.

(2) Before or upon application of 50 pounds of control force upon a fully manual service brake.

(3) Before or upon application of 25 pounds of control force upon a service brake with a brake power assist unit.

(4) When the supply pressure in a brake power unit drops to a level not less than one-half of the normal system pressure.

(b) A drop in the level of brake fluid in any master cylinder reservoir compartment to less than the recommended safe level specified by the manufacturer or to one-fourth of the fluid capacity of that reservoir compartment, whichever is greater.

(c) A malfunction that affects the generation or transmission of response or control signals in an antilock brake system, or a total functional electrical failure in a variable proportioning brake system.

(d) Application of the parking brake.

(e) For a vehicle with electrically-actuated service brakes, failure of the source of electric power to the brakes, or diminution of state of charge of the batteries to less

than a level specified by the manufacturer for the purpose of warning a driver of degraded brake performance.

(f) For a vehicle with electric transmission of the service brake control signal, failure of a brake control circuit.

(g) For an EV with RBS that is part of the service brake system, failure of the RBS.

S5.3.2 (a) Except as provided in paragraph (b) of this section, all indicator lamps shall be activated as a check of lamp function either when the ignition (start) switch is turned to the “on” (run) position when the engine is not running, or when the ignition (start) switch is in a position between “on” (run) and “start” that is designated by the manufacturer as a check position.

(b) The indicator lamps need not be activated when a starter interlock is in operation.

S5.3.3 (a) Each indicator lamp activated due to a condition specified in S5.3.1 shall remain activated as long as the malfunction exists, whenever the ignition (start) switch is in the “on” (run) position, whether or not the engine is running.

(b) For vehicles manufactured on and after September 1, 1999 with GVWRs greater than 10,000 lbs, each message about the existence of a malfunction, as described in S5.3.1(c), shall be stored in the antilock brake system after the ignition switch is turned to the “off” position and the indicator lamp shall

be automatically reactivated when the ignition switch is again turned to the “on” position. The indicator lamp shall also be activated as a check of lamp function whenever the ignition is turned to the “on” (run) position. The indicator lamp shall be deactivated at the end of the check of lamp function unless there is a malfunction or a message about a malfunction that existed when the key switch was last turned to the “off” position.

S5.3.4 When an indicator lamp is activated it may be steady burning or flashing.

S5.3.5 (a) Each indicator lamp shall display word, words or abbreviation, in accordance with the requirements of Standard No. 101 (49 CFR 571.101) and/or this section, which shall have letters not less than 1/8-inch high and be legible to the driver in daylight when lighted. Words in addition to those required by Standard No. 101 and/or this section and symbols may be provided for purposes of clarity.

(b) If a single common indicator is used, the lamp shall display the word “Brake”. The letters and background of a single common indicator shall be of contrasting colors, one of which is red.

Regulations

(c)(1) If separate indicators are used for one or more of the conditions described in S5.3.1(a) through S5.3.1(g) of this standard, the indicator display shall include the word “Brake” and appropriate additional labeling, except as provided in (c)(1) (A) through (D) of this paragraph.

(A) If a separate indicator lamp is provided for gross loss of pressure, the words “Brake Pressure” shall be used for S5.3.1(a).

(B) If a separate indicator lamp is provided for low brake fluid, the words “Brake Fluid” shall be used for S5.3.1(b), except for vehicles using hydraulic system mineral oil.

(C) If a separate indicator lamp is provided for an anti-lock system, the single word “Antilock” or “Anti-lock”, or the abbreviation “ABS”, may be used for S5.3.1(c).

(D) If a separate indicator lamp is provided for application of the parking brake, the single word “Park” may be used for S5.3.1(d).

(E) If a separate indicator is used for the regenerative brake system, the symbol “RBS” may be used. RBS failure may also be indicated by a lamp displaying the symbol “ABS/RBS.”

(2) Except for a separate indicator lamp for an anti-lock system, a regenerative system, or an indicator for both anti-lock and regenerative system, the letters and background of each separate indicator lamp shall be of contrasting colors, one of which is red. The letters and background of a separate lamp for an anti-lock system, a regenerative system, or a lamp displaying both an anti-lock and a regenerative system shall be of contrasting colors, one of which is yellow.

S5.4 Reservoirs.

S5.4.1 Master cylinder reservoirs. A master cylinder shall have a reservoir compartment for each service brake subsystem serviced by the master cylinder. Loss of fluid from one compartment shall not result in a complete loss of brake fluid from another compartment.

S5.4.2 Reservoir capacity. Reservoirs, whether for master cylinders or other type systems, shall have a total minimum capacity equivalent to the fluid displacement resulting when all the wheel cylinders or caliper pistons serviced by the reservoirs move from a new lining, fully retracted position (as adjusted initially to the manufacturer’s recommended setting) to a fully worn, fully applied position, as determined in accordance with S7.18(c) of this standard. Reservoirs shall have completely separate compartments for each subsystem except that in reservoir systems utilizing a portion of the reservoir for a common supply to two or more subsystems, individual partial compartments shall each have a minimum volume of fluid equal to at least the volume displaced by the master cylinder piston servicing the subsystem, during a full stroke of the piston. Each brake power unit reservoir servicing only the brake system shall have a minimum capacity equivalent to the fluid displacement required to charge the system piston(s) or accumulator(s) to normal operating pressure plus the displacement resulting when all the wheel cylinders or caliper pistons serviced by the reservoir or accumulator(s) move from a new lining fully retracted position (as adjusted initially

to the manufacturer’s recommended setting) to a fully worn, fully applied position.

S5.4.3 Reservoir labeling—Each vehicle equipped with hydraulic brakes shall have a brake fluid warning statement that reads as follows, in letters at least one-eighth of an inch high: “WARNING, Clean filler cap before removing. Use only ___ fluid from a sealed container.” (Inserting the recommended type of brake fluid as specified in 49 CFR 571.116, e.g., “DOT 3”). The lettering shall be—

(a) Permanently affixed, engraved, or embossed;

(b) Located so as to be visible by direct view, either on or within 4 inches of the brake fluid reservoir filler plug or cap; and

(c) Of a color that contrasts with its background, if it is not engraved or embossed.

S5.5 Antilock and variable proportioning brake systems.

S5.5.1 Each vehicle with a GVWR greater than 10,000 pounds, except for any vehicle with a speed attainable in 2 miles of not more than 33 mph, shall be equipped with an antilock brake system that directly controls the wheels of at least one front axle and the wheels of at least one rear axle of the vehicle. On each vehicle with a GVWR greater than 10,000 pounds but not greater than 19,500 pounds and motor homes with a GVWR greater than 10,000 pounds but not greater than 22,500 pounds manufactured before March 1, 2001, the antilock brake system may also directly control the wheels of the rear drive axle by means of a single sensor in the driveline. Wheels on other axles of the vehicle may be indirectly controlled by the antilock brake system.

S5.5.2 In the event of any failure (structural or functional) in an antilock or variable proportioning brake system, the vehicle shall be capable of meeting the stopping distance requirements specified in S5.1.2 for service brake system partial failure. For an EV that is equipped with both ABS and RBS that is part of the service brake system, the ABS must control the RBS.

S5.6 Brake system integrity. Each vehicle shall be capable of completing all performance requirements of S5 without—

(a) Detachment or fracture of any component of the braking system, such as brake springs and brake shoe or disc pad facing, other than minor cracks that do not impair attachment of the friction facing. All mechanical components of the braking system shall be intact and functional. Friction facing tearout (complete detachment of lining) shall not exceed 10 percent of the lining on any single frictional element.

(b) Any visible brake fluid or lubricant on the friction surface of the brake, or leakage at the master cylinder or brake power unit reservoir cover, seal and filler openings.

S6 Test conditions. The performance requirements of S5 shall be met under the following conditions. Where a range of conditions is specified, the vehicle shall be capable of meeting the requirements at all points within the range. Compliance of vehicles manufactured in two or more stages may, at the option of the final-stage manufacturer, be demonstrated to comply with this standard

Vehicle Maintenance Pro

by adherence to the instructions of the incomplete manufacturer provided with the vehicle in accordance with § 568.4(a)(7)(ii) and §568.5 of title 49 of the Code of Federal Regulations.

S6.1 Vehicle weight.

S6.1.1 Other than tests specified at lightly loaded vehicle weight in S7.5(a), S7.7, S7.8, and S7.9, the vehicle is loaded to its GVWR such that the weight on each axle as measured at the tire-ground interface is in proportion to its GAWR, except that each fuel tank is filled to any level from 100 percent of capacity (corresponding to full GVWR) to 75 percent. However, if the weight on any axle of a vehicle at lightly loaded vehicle weight exceeds the axle's proportional share of the gross vehicle weight rating, the load required to reach GVWR is placed so that the weight on that axle remains the same as a lightly loaded vehicle weight.

S6.1.2 For applicable tests specified in S7.5(a), S7.7, S7.8, and S7.9, vehicle weight is lightly loaded vehicle weight, with the added weight, except for the roll bar structure allowed for trucks and buses with a GVWR greater than 10,000 pounds, distributed in the front passenger seat area in passenger cars, multipurpose passenger vehicles, and trucks, and in the area adjacent to the driver's seat in buses.

S6.2 Electric vehicles and electric brakes.

S6.2.1 The state of charge of the propulsion batteries is determined in accordance with SAE Recommended Practice J227a (1976) (incorporated by reference, see §571.5). The applicable sections of SAE J227a (1976) are 3.2.1 through 3.2.4, 3.3.1 through 3.3.2.2, 3.4.1 and 3.4.2, 4.2.1, 5.2, 5.2.1, and 5.3.

S6.2.2 At the beginning of the first effectiveness test specified in S7.3, and at the beginning of each burnishing procedure, each EV's propulsion battery is at the maximum state of charge recommended by the manufacturer, as stated in the vehicle operator's manual or on a label that is permanently attached to the vehicle, or, if the manufacturer has made no recommendation, at a state of charge of not less than 95 percent. If a battery is replaced rather than recharged, the replacement battery is to be charged and measured for state of charge in accordance with these procedures. During each burnish procedure, each propulsion battery is restored to the recommended state of charge or a state of charge of not less than 95 percent after each increment of 40 burnish stops until each burnish procedure is complete. The batteries may be charged at a more frequent interval if, during a particular 40-stop increment, the EV is incapable of achieving the initial burnish test speed. During each burnish procedure, the propulsion batteries may be charged by an external means or replaced by batteries that are charged to the state of charge recommended by the manufacturer or a state of charge of not less than 95 percent. For EVs having a manual control for setting the level of regenerative braking, the manual control, at the beginning of each burnish procedure, is set to provide maximum regenerative braking throughout the burnish.

S6.2.3 At the beginning of each performance test in the test sequence (S7.3, S7.5, S7.7 through S7.11, and S7.13 through S7.19 of this standard), unless otherwise specified, each propulsion battery of an EV is at the maxi-

mum state of charge recommended by the manufacturer, as stated in the vehicle operator's manual or on a label that is permanently attached to the vehicle, or, if the manufacturer has made no recommendation, at a state of charge of not less than 95 percent. If batteries are replaced rather than recharged, each replacement battery shall be charged and measured for state of charge in accordance with these procedures. No further charging of any propulsion battery occurs during any of the performance tests in the test sequence of this standard. If the propulsion batteries are depleted during a test sequence such that the vehicle reaches automatic shutdown, will not accelerate, or the low state of charge warning lamp is illuminated, the vehicle is to be accelerated to brake test speed by auxiliary means.

S6.2.4(a) For an EV equipped with RBS, the RBS is considered to be part of the service brake system if it is automatically controlled by an application of the service brake control, if there is no means provided for the driver to disconnect or otherwise deactivate it, and if it is activated in all transmission positions, including neutral. The RBS is operational during all burnishes and all tests, except for the test of a failed RBS.

(b) For an EV equipped with an RBS that is not part of the service brake system, the RBS is operational and set to produce the maximum regenerative braking effect during the burnishes, and is disabled during the test procedures. If the vehicle is equipped with a neutral gear that automatically disables the RBS, the test procedures which are designated to be conducted in gear may be conducted in neutral.

S6.2.5 For tests conducted "in neutral," the operator of an EV with no "neutral" position (or other means such as a clutch for disconnecting the drive train from the propulsion motor(s)) does not apply any electromotive force to the propulsion motor(s). Any electromotive force that is applied to the propulsion motor(s) automatically remains in effect unless otherwise specified by the test procedure.

S6.2.6 A vehicle equipped with electrically-actuated service brakes also performs the following test series. Conduct 10 stopping tests from a speed of 100 kph or the maximum vehicle speed, whichever is less. At least two of the 10 stopping distances must be less than or equal to 70 meters. The vehicle is loaded to GVWR for these tests and the transmission is in the neutral position when the service brake control is actuated and throughout the remainder of the test. The battery or batteries providing power to those electrically-actuated brakes, at the beginning of each test, shall be in a depleted state of charge for conditions (a), (b), or (c) of this paragraph as appropriate. An auxiliary means may be used to accelerate an EV to test speed.

(a) For an EV equipped with electrically-actuated service brakes deriving power from the propulsion batteries, and with automatic shut-down capability of the propulsion motor(s), the propulsion batteries are at not more than five percent above the EV actual automatic shut-down critical value. The critical value is determined by measuring the state-of-charge of each propulsion battery at the instant that automatic shut-down occurs and averaging the states-of-charge recorded.

Regulations

(b) For an EV equipped with electrically-actuated service brakes deriving power from the propulsion batteries, and with no automatic shut-down capability of the propulsion motor(s), the propulsion batteries are at an average of not more than five percent above the actual state of charge at which the brake failure warning signal, required by S5.3.1(e) of this standard, is illuminated.

(c) For a vehicle which has an auxiliary battery (or batteries) that provides electrical energy to operate the electrically-actuated service brakes, the auxiliary battery(batteries) is (are) at (at an average of) not more than five percent above the actual state of charge at which the brake failure warning signal, required by S5.3.1(e) of this standard, is illuminated.

S6.3 Tire inflation pressure. Tire inflation pressure is the pressure recommended by the vehicle manufacturer for the GVWR of the vehicle.

S6.4 Transmission selector control. For S7.3, S7.5, S7.8, S7.15, S7.17, S7.11.1.2, S7.11.2.2, S7.11.3.2, and as required for S7.13, the transmission selector control is in neutral for all decelerations. For all other tests during all decelerations, the transmission selector is in the control position, other than overdrive, recommended by the manufacturer for driving on a level surface at the applicable test speed. To avoid engine stall during tests required to be run in gear a manual transmission may be shifted to neutral (or the clutch disengaged) when the vehicle speed decreases to 20 mph.

S6.5 Engine. Engine idle speed and ignition timing settings are according to the manufacturer's recommendations. If the vehicle is equipped with an adjustable engine speed governor, it is adjusted according to the manufacturer's recommendation.

S6.6 Vehicle openings. All vehicle openings (doors, windows, hood, trunk, convertible top, cargo doors, etc.) are closed except as required for instrumentation purposes.

S6.7 Ambient temperature. The ambient temperature is any temperature between 32°F. and 100°F.

S6.8 Wind velocity. The wind velocity is zero.

S6.9 Road surface.

S6.9.1 For vehicles with a GVWR of 10,000 pounds or less, road tests are conducted on a 12-foot-wide, level roadway, having a skid number of 81. Burnish stops are conducted on any surface. The parking brake test surface is clean, dry, smooth, Portland cement concrete.

S6.9.2(a) For vehicles with a GVWR greater than 10,000 pounds, road tests (excluding stability and control during braking tests) are conducted on a 12-foot-wide, level roadway, having a peak friction coefficient of 0.9 when measured using an ASTM E1136-93 (Reapproved 2003) (incorporated by reference, see §571.5), standard reference test tire, in accordance with ASTM E1337-90 (Reapproved 2008) (incorporated by reference, see §571.5), at a speed of 40 mph, without water delivery. Burnish stops are conducted on any surface. The parking brake test surface is clean, dry, smooth, Portland cement concrete.

S6.9.2(b) For vehicles with a GVWR greater than 10,000 pounds, stability and control during braking tests are conducted on a 500-foot-radius curved roadway with a

wet level surface having a peak friction coefficient of 0.5 when measured on a straight or curved section of the curved roadway using an ASTM E1136-93 (Reapproved 2003) standard reference tire, in accordance with ASTM E1337-90 (Reapproved 2008) at a speed of 40 mph, with water delivery.

S6.10 Vehicle position and wheel lockup restrictions. The vehicle is aligned in the center of the roadway at the start of each brake application. Stops, other than spike stops, are made without any part of the vehicle leaving the roadway.

S6.10.1 For vehicles with a GVWR of 10,000 pounds or less, stops are made with wheel lockup permitted only as follows:

(a) At vehicle speeds above 10 mph, there may be controlled wheel lockup on an antilock-equipped axle, and lockup of not more than one wheel per vehicle, uncontrolled by an antilock system. (Dual wheels on one side of an axle are considered a single wheel.)

(b) At vehicle speeds of 10 mph or less, any wheel may lock up for any duration.

(c) Unlimited wheel lockup is allowed during spike stops (but not spike check stops), partial failure stops, and inoperative brake power or power assist unit stops.

S6.10.2 For vehicles with a GVWR greater than 10,000 pounds, stops are made with wheel lockup permitted only as follows:

(a) At vehicle speeds above 20 mph, any wheel on a nonsteerable axle other than the two rearmost nonliftable, nonsteerable axles may lock up for any duration. The wheels on the two rear-most nonliftable, nonsteerable axles may lock up according to (b).

(b) At vehicle speeds above 20 mph, one wheel on any axle or two wheels on any tandem may lock up for any duration.

(c) At vehicle speeds above 20 mph, any wheel not permitted to lock in (a) or (b) may lock up repeatedly, with each lockup occurring for a duration of one second or less.

(d) At vehicle speeds of 20 mph or less, any wheel may lock up for any duration.

(e) Unlimited wheel lockup is allowed during partial failure stops, and inoperative brake power or power assist stops.

S6.11 Thermocouples. The brake temperature is measured by plug-type thermocouples installed in the approximate center of the facing length and width of the most heavily loaded shoe or disc pad, one per brake, as shown in figure 1. A second thermocouple may be installed at the beginning of the test sequence if the lining wear is expected to reach a point causing the first thermocouple to contact the metal rubbing surface of a drum or rotor. For centergrooved shoes or pads, thermocouples are installed within one-eighth of an inch to one-quarter inch of the groove and as close to the center as possible.

S6.12 Initial brake temperature. Unless otherwise specified the brake temperature is 150 °F. to 200 °F.

S6.13 Control forces. Unless otherwise specified, the force applied to a brake control is not less than 15 lb and not more than 150 lb.

Vehicle Maintenance Pro

S6.14 Special drive conditions. A vehicle with a GVWR greater than 10,000 pounds equipped with an interlocking axle system or a front wheel drive system that is engaged and disengaged by the driver is tested with the system disengaged.

S6.15 Selection of compliance options. Where manufacturer options are specified, the manufacturer shall select the option by the time it certifies the vehicle and may not thereafter select a different option for the vehicle. Each manufacturer shall, upon request from the National Highway Traffic Safety Administration, provide information regarding which of the compliance options it has selected for a particular vehicle or make/model.

S7. Test procedure and sequence. Each vehicle shall be capable of meeting all the applicable requirements of S5 when tested according to the procedures and sequence set forth below, without replacing any brake system part or making any adjustments to the brake system other than as permitted in the burnish and reburnish procedures and in S7.9 and S7.10. (For vehicles only having to meet the requirements of S5.1.1, S5.1.2, S5.1.3, and S5.1.7 in section S5.1, the applicable test procedures and sequence are S7.1, S7.2, S7.4, S7.5(b), S7.5(a), S7.8, S7.9, S7.10, and S7.18. However, at the option of the manufacturer, the following test procedure and sequence may be conducted: S7.1, S7.2, S7.3, S7.4, S7.5(b), S7.6, S7.7, S7.5(a), S7.8, S7.9, S7.10, and S7.18. The choice of this option must not be construed as adding to the requirements specified in S5.1.2 and S5.1.3.) Automatic adjusters must remain activated at all times. A vehicle shall be deemed to comply with the stopping distance requirements of S5.1 if at least one of the stops at each speed and load specified in each of S7.3, S7.5(b), S7.8, S7.9, S7.10, S7.15 and S7.17 (check stops) is made within a stopping distance that does not exceed the corresponding distance specified in Table II. When the transmission selector control is required to be in neutral for a deceleration, a stop or snub must be obtained by the following procedures:

- (a) Exceed the test speed by 4 to 8 mph;
- (b) Close the throttle and coast in gear to approximately 2 mph above the test speed;
- (c) Shift to neutral; and
- (d) When the test speed is reached, apply the service brakes.

S7.1 **Brake warming.** If the initial brake temperature for the first stop in a test procedure (other than S7.7 and S7.16) has not been reached, heat the brakes to the initial brake temperature by making not more than 10 snubs from not more than 40 to 10 mph, at a deceleration not greater than 10 fpsps.

S7.2 **Pretest instrumentation check.** Conduct a general check of instrumentation by making not more than 10 stops from a speed of not more than 30 mph, or 10 snubs from a speed of not more than 40 to 10 mph, at a deceleration of not more than 10 fpsps. If instrument repair, replacement, or adjustment is necessary, make not more than 10 additional stops or snubs after such repair, replacement, or adjustment.

S7.3 **Service brake system-first (preburnish) effectiveness test.** Make six stops from 30 mph. Then make six stops from 60 mph.

S7.4 **Service brake system-burnish procedure.**

S7.4.1 **Vehicles with GVWR of 10,000 lb or less.**

S7.4.1.1 **Burnish.** Burnish the brakes by making 200 stops from 40 mph at 12 fpsps (the 150 lb control force limit does not apply here). The interval from the start of one service brake application to the start of the next shall be either the time necessary to reduce the initial brake temperature to between 230 °F. and 270 °F., or the distance of 1 mile, whichever occurs first. Accelerate to 40 mph after each stop and maintain that speed until making the next stop.

S7.4.1.2 **Brake adjustment-post burnish.** After burnishing, adjust the brakes in accordance with the manufacturer's published recommendations.

S7.4.2 **Vehicles with GVWR greater than 10,000 pounds.**

S7.4.2.1 **Burnish.** Vehicles are burnished according to the following procedures. Make 500 snubs between 40 mph and 20 mph at a deceleration rate of 10 f.p.s.p.s. Except where an adjustment is specified, after each brake application accelerate to 40 mph and maintain that speed until making the next brake application at a point 1 mile from the initial point of the previous brake application. If the vehicle cannot attain a speed of 40 mph in 1 mph, continue to accelerate until the vehicle reaches 40 mph or until the vehicle has traveled 1.5 miles from the initial point of the previous brake application, whichever occurs first. The brakes shall be adjusted three times during the burnish procedure, in accordance with the manufacturer's recommendations, after 125, 250, and 375 snubs.

S7.4.2.2 **Brake adjustment-post burnish.** After burnishing, adjust the brakes in accordance with the manufacturer's published recommendations.

S7.5(a) Stability and control during braking (vehicles with a GVWR greater than 10,000 pounds). Make four stops in the lightly-loaded weight condition specified in S5.1.7. Use a full brake application for the duration of the stop, with the clutch pedal depressed or the transmission selector control in the neutral position, for the duration of each stop.

(b) Service brake system-second effectiveness test. For vehicles with a GVWR of 10,000 pounds or less, or any school bus, make six stops from 30 mph. Then, for any vehicle, make six stops from 60 mph. Then, for a vehicle with a GVWR of 10,000 pounds or less, make

Regulations

four stops from 80 mph if the speed attainable in 2 miles is not less than 84 mph.

S7.6 First reburnish. Repeat S7.4, except make 35 burnish stops or snubs. In the case of vehicles burnished in accordance with S7.4.2.1(a) of this section, reburnish the vehicle by making 35 snubs from 60 to 20 mph, but if the hottest brake temperature reaches $500^{\circ}\text{F} \pm 50^{\circ}\text{F}$, make the remainder of the brake applications from the highest snub condition listed in Table IV that will maintain the hottest brake temperature at $500^{\circ}\text{F} \pm 50^{\circ}\text{F}$. If at a snub condition of 40 to 20 mph, the temperature of the hottest brake exceeds 550°F , make the remainder of the 35 brake applications from that snub condition without regard to brake temperature.

S7.7 Parking brake test. The parking brake tests for any vehicle on different grades, in different directions, and for different loads may be conducted in any order. The force required for actuation of a hand-operated brake system shall be measured at the center of the hand grip area or at a distance of $1\frac{1}{2}$ inches from the end of the actuation lever, as illustrated in Figure II.

S7.7.1 Test procedure for requirements of S5.2.1 and 55.2.3.

S7.7.1.1 Condition the parking brake friction elements so that the temperature at the beginning of the test is at any level not more than 150°F . (when the temperature of components on both ends of an axle are averaged).

S7.7.1.2 Drive the vehicle, loaded to GVWR, onto the specified grade with the longitudinal axis of the vehicle in the direction of the slope of the grade, stop the vehicle and hold it stationary by application of the service brake control, and place the transmission in neutral.

S7.7.1.3 With the vehicle held stationary by means of the service brake control, apply the parking brake by a single application of the force specified in (a), (b), or (c) of this paragraph, except that a series of applications to achieve the specified force may be made in the case of a parking brake system design that does not allow the application of the specified force in a single application:

(a) In the case of a passenger car or other vehicle with a GVWR of 10,000 lbs. or less, not more than 125 pounds for a foot-operated system, and not more than 90 pounds for a hand-operated system; and

(b) In the case of a vehicle with a GVWR greater than 4,536 kilograms (10,000 pounds) not more than 150 pounds for a foot-operated system, and not more than 125 pounds for a hand-operated system.

(c) For a vehicle using an electrically-activated parking brake, apply the parking brake by activating the parking brake control.

S7.7.1.4 Following the application of the parking brake in accordance with S7.7.1.3, release all force on the service brake control and commence the measurement of time if the vehicle remains stationary. If the vehicle does not remain stationary, reapplication of the service brake to hold the vehicle stationary, with reapplication of a force to the parking brake control at the level specified in S7.7.1.3 (a) or (b) as appropriate for the vehicle being tested (without release of the ratcheting or

other holding mechanism of the parking brake) may be used twice to attain a stationary position.

S7.7.1.5 Following observation of the vehicle in a stationary condition for the specified time in one direction, repeat the same test procedure with the vehicle orientation in the opposite direction on the specified grade.

S7.7.1.6 Check the operation of the parking brake application indicator required by S5.3.1(d).

S7.7.2 Test procedure for requirements of S5.2.2

(a) Check that transmission must be placed in park position to release key;

(b) Test as in S7.7.1, except in addition place the transmission control to engage the parking mechanism; and

(c) Test as in S7.7.1 except on a 20 percent grade, with the parking mechanism not engaged.

S7.7.3 Lightly loaded vehicle. Repeat S7.7.1 or S7.7.2 as applicable except with the vehicle at lightly loaded vehicles weight or at manufacturer's option, for a vehicle with GVWR greater than 10,000 pounds, at lightly loaded vehicle weight plus not more than an additional 1,000 pounds for a roll bar structure on the vehicle.

S7.7.4 Non-service brake type parking brake systems. For vehicles with parking brake systems not utilizing the service brake friction elements, burnish the friction elements of such systems prior to parking brake tests according to the manufacturer's published recommendations as furnished to the purchaser. If no recommendations are furnished, run the vehicle in an unburnished condition.

S7.8 Service brake system test—lightly loaded vehicle (third effectiveness) test. Make six stops from 60 mph with vehicle at lightly vehicle weight, or at the manufacturer's option for a vehicle with GVWR greater than 10,000 pounds, at lightly loaded vehicle weight plus not more than an additional 1,000 pounds for a roll bar structure on the vehicle. (This test is not applicable to a vehicle which has a GVWR of not less than 7,716 pounds and not greater than 10,000 pounds and is not a school bus.)

S7.9 Service brake system test—partial failure.

S7.9.1 With the vehicle at lightly loaded vehicle weight or at the manufacturer's option for a vehicle with a GVWR greater than 10,000 pounds, at lightly loaded vehicle weight plus not more than an additional 1,000 pounds for a roll bar structure on the vehicle, alter the service brake system to produce any one rupture or leakage type of failure, other than a structural failure of a housing that is common to two or more subsystems. Determine the control force, pressure level, or fluid level (as appropriate for the indicator being tested) necessary to activate the brake system indicator lamp. Make four stops if the vehicle is equipped with a split service brake system, or 10 stops if the vehicle is not so equipped, each from 60 mph, by a continuous application of the service brake control. Restore the service brake system to normal at completion of this test.

S7.9.2 Repeat S7.9.1 for each of the other subsystems.

Vehicle Maintenance Pro

S7.9.3 Repeat S7.9.1 and S7.9.2 with vehicle at GVWR. Restore the service brake system to normal at completion of this test.

S7.9.4 (For vehicles with antilock and/or variable proportioning brake systems). With vehicle at GVWR, disconnect functional power source, or otherwise render antilock system inoperative. Disconnect variable proportioning brake system. Make four stops, each from 60 mph. If more than one antilock or variable proportioning brake subsystem is provided, disconnect or render one subsystem inoperative and run as above. Restore system to normal at completion of this test. Repeat for each subsystem provided.

Determine whether the brake system indicator lamp is activated when the electrical power source to the antilock or variable proportioning unit is disconnected.

S7.9.5 For a vehicle in which the brake signal is transmitted electrically between the brake pedal and some or all of the foundation brakes, regardless of the means of actuation of the foundation brakes, the tests in S7.9.1 through S7.9.3 of this standard are conducted by inducing any single failure in any circuit that electrically transmits the brake signal, and all other systems intact. Determine whether the brake system indicator lamp is activated when the failure is induced.

S7.9.6 For an EV with RBS that is part of the service brake system, the tests specified in S7.9.1 through S7.9.3 are conducted with the RBS disconnected and all other systems intact. Determine whether the brake system indicator lamp is activated when the RBS is disconnected.

S7.10 Service brake system—inoperative brake power unit or brake power assist unit test. (For vehicles equipped with brake power unit or brake power assist unit.)

S7.10.1 Regular procedure. (This test need not be run if the option in S7.10.2 is selected.) On vehicles with brake power assist units, render the brake power assist unit inoperative, or one of the brake power assist unit subsystems if two or more subsystems are provided, by disconnecting the relevant power supply. Exhaust any residual brake power reserve capability of the disconnected system. On vehicles with brake power units, disconnect the primary source of power. Make four stops, each from 60 mph by a continuous application of the service brake control. Restore the system to normal at completion of this test. For vehicles equipped with more than one brake power unit or brake power assist unit, conduct tests of each in turn.

S7.10.2 Optional Procedures. On vehicles with brake power assist units, the unit is charged to maximum prior to start of test. (Engine may be run up in speed, then throttle closed quickly to attain maximum charge on vacuum assist units.) Brake power units shall also be charged to maximum accumulator pressure prior to start of test. No recharging is allowed after start of test.

(a) (For vehicles with brake power assist units.) Disconnect the primary source of power. Make six stops each from 60 mph, to achieve the average deceleration for each stop as specified in table III. Apply the brake

control as quickly as possible. Maintain control force until vehicle has stopped.

At the completion of the stops specified above, deplete the system of any residual brake power reserve capability. Make one stop from 60 mph at an average deceleration of not lower than 7 fpsps for passenger cars (equivalent stopping distance 554 feet), or 6 fpsps for vehicles other than passenger cars (equivalent stopping distance 646 feet) and determine whether the control force exceeds 150 pounds.

(b) (For vehicles with brake power units with accumulator type systems.) Test as in S7.10.2(a), except make 10 stops instead of 6 and, at the completion of the 10 stops, deplete the failed element of the brake power unit of any residual brake power reserve capability before making the final stop.

(c) (For vehicles with brake power assist or brake power units with backup systems.) If the brake power or brake power assist unit operates in conjunction with a backup system and the backup system is activated automatically in the event of a primary power failure, the backup system is operative during this test. Disconnect the primary source of power of one subsystem. Make 15 stops, each from 60 mph, with the backup system activated for the failed subsystem, to achieve an average deceleration of 12 fpsps for each stop.

(d) Restore systems to normal at completion of these tests. For vehicles equipped with more than one brakepower assist or brakepower unit, conduct tests of each in turn.

S7.10.3 Electric brakes.

(a) For vehicles with electrically-actuated service brakes, the tests in S7.10.1 or S7.10.2 are conducted with any single electrical failure in the electric brake system instead of the brake power or brake power assist systems, and all other systems intact.

(b) For EVs with RBS that is part of the service brake system, the tests in S7.10.1 or S7.10.2 are conducted with the RBS discontinued and all other systems intact.

S7.11 Service brake system—first fade and recovery test.

S7.11.1 Baseline check stops or snubs.

S7.11.1.1 Vehicles with GVWR of 10,000 lb or less. Make three stops from 30 mph at 10 fpsps for each stop. Control force readings may be terminated when vehicle speed falls to 5 mph. Average the maximum brake control force required for the three stops.

S7.11.1.2 Vehicles with GVWR greater than 10,000 pounds. With transmission in neutral (or declutched), make three snubs from 40 to 20 mph at 10 fpsps for each snub. Average the maximum brake control force required for the three snubs.

S7.11.2 Fade stops or snubs.

S7.11.2.1 Vehicles with GVWR of 10,000 pounds or less. Make 5 stops from 60 mph at 15 fpsps followed by 5 stops at the maximum attainable deceleration between 5 and 15 fpsps for each stop. Establish an initial brake temperature before the first brake application of 130° to 150°F. Initial brake temperatures before brake applications for subsequent stops are those occurring at

Regulations

the distance intervals. Attain the required deceleration within 1 second and, as a minimum, maintain it for the remainder of the stopping time. Control force readings may be terminated when vehicle speed falls to 5 mph. Leave an interval of 0.4 mi between the start of brake applications. Accelerate immediately to the initial test speed after each stop. Drive 1 mi at 30 mph after the last fade stop, and immediately follow the recovery procedure specified in S7.11.3.1.

S7.11.2.2 Vehicles with GVWR greater than 10,000 lb. With transmission in neutral (or declutched) make 10 snubs from 40 to 20 mph at 10 fpsps for each snub. Establish an initial brake temperature before the first brake application of 130 °F. to 150 °F. Initial brake temperatures before brake application for subsequent snubs are those occurring in the time intervals specified below. Attain the required deceleration within 1 s and maintain it for the remainder of the snubbing time. Leave an interval of 30 s between snubs (start of brake application to start of brake application). Accelerate immediately to the initial test speed after each snub. Drive for 1.5 mi at 40 mph after the last snub and immediately follow the recovery procedure specified in S7.11.3.2.

S7.11.3 Recovery stops or snubs.

S7.11.3.1 Vehicles with GVWR of 10,000 lb or less. Make five stops from 30 mph at 10 fpsps for each stop. Control force readings may be terminated when vehicle speed falls to 5 mph. Allow a braking distance interval of 1 mi. Immediately after each stop accelerate at maximum rate to 30 mph and maintain that speed until making the next stop. Record the maximum control force for each stop.

S7.11.3.2 Vehicles with GVWR greater than 10,000 lb. With transmission in neutral (or declutched) make five snubs from 40 to 20 mph at 10 fpsps for each snub. After each snub, accelerate at maximum rate to 40 mph and maintain that speed until making the next brake application at a point 1.5 mi from the point of the previous brake application. Record the maximum control force for each snub.

S7.12 Service brake system-second re-burnish. Repeat S7.6.

S7.13 Service brake system-second fade and recovery test. Repeat S7.11 except in S7.11.2 run 15 fade stops or 20 snubs instead of 10.

S7.14 Third reburnish. Repeat S7.6.

S7.15 Service brake system-fourth effectiveness test. Repeat S7.5. Then (for passenger cars) make four stops from either 95 mph if the speed attainable in 2 mi is 99 to (but not including) 104 mph, or 100 mph if the speed attainable in 2 mi is 104 mph or greater.

S7.16 Service brake system-water recovery test.

S7.16.1 Baseline check stop. Make three stops from 30 mph at 10 fpsps for each stop. Control force readings may be terminated when vehicle speed falls to 5 mph. Average the maximum brake control force required for the three stops.

S7.16.2 Wet brake recovery stops. With the brakes fully released at all times, drive the vehicle for 2 min at a speed of 5 mph in any combination of forward and reverse directions, through a trough having a water depth

of 6 in. After leaving the trough, immediately accelerate at a maximum rate to 30 mph without a brake application. Immediately upon reaching that speed make five stops, each from 30 mph at 10 fpsps for each stop. After each stop (except the last), accelerate the vehicle immediately at a maximum rate to a speed of 30 mph and begin the next stop.

S7.17 Spike stops. Make 10 successive spike stops from 30 mph with the transmission in neutral, with no reverse stops. Make spike stops by applying a control force of 200 lb while recording control force versus time. Maintain control force until vehicle has stopped. At completion of 10 spike stops, make six effectiveness stops from 60 mph.

S7.18 Final inspection. Inspect—

(a) The service brake system for detachment or fracture of any components, such as brake springs and brake shoes or disc pad facing.

(b) The friction surface of the brake, the master cylinder or brake power unit reservoir cover and seal and filler openings, for leakage of brake fluid or lubricant.

(c) The master cylinder or brake power unit reservoir for compliance with the volume and labeling requirements of S5.4.2 and S5.4.3. In determining the fully applied worn condition assume that the lining is worn to: (1) Rivet or bolt heads on riveted or bolted linings, or (2) within one thirty-seconds of an inch of shoe or pad mounting surface on bonded linings, or (3) the limit recommended by the manufacturer, whichever is larger relative to the total possible shoe or pad movement. Drums or rotors are assumed to be at nominal design drum diameter or rotor thickness. Linings are assumed adjusted for normal operating clearance in the released position.

(d) The brake system indicator light(s), for compliance with operation in various key positions, lens color, labeling, and location, in accordance with S5.3.

S7.19 Moving barrier test. (Only for vehicles that have been tested according to S7.7.2.) Load the vehicle to GVWR, release parking brake, and place the transmission selector control to engage the parking mechanism. With a moving barrier as described in paragraph 4.3 of SAE Recommended Practice J972 (2000) (incorporated by reference, see §571.5), impact the vehicle from the front at 2½ mph. Keep the longitudinal axis of the barrier parallel with the longitudinal axis of the vehicle. Repeat the test, impacting the vehicle from the rear.

NOTE: The vehicle used for this test need not be the same vehicle that has been used for the braking tests.

Vehicle Maintenance Pro

Figure 1 - Typical plug thermo couple installations

NOTE: The second thermocouple shall be installed at .080 inch depth within 1 inch circumferentially of the thermocouple installed at .040 inch depth.

§571.106 Standard No. 106; Brake hoses.

S1. Scope. This standard specifies labeling and performance requirements for motor vehicle brake hose, brake hose assemblies, and brake hose end fittings.

S2. Purpose. The purpose of this standard is to reduce deaths and injuries occurring as a result of brake system failure from pressure or vacuum loss due to hose or hose assembly rupture.

S3. Application. This standard applies to passenger cars, multipurpose passenger vehicles, trucks, buses, trailers, and motorcycles, and to hydraulic, air, and vacuum brake hose, brake hose assemblies, and brake hose end fittings for use in those vehicles.

S4. Definitions.

Armor means protective material installed on a brake hose to increase the resistance of the hose or hose assembly to abrasion or impact damage.

Brake hose means a flexible conduit, other than a vacuum tubing connector, manufactured for use in a brake system to transmit or contain the fluid pressure or vacuum used to apply force to a vehicle's brakes. For hose, a dimensional description such as "¼-inch hose" refers to the nominal inside diameter. For tubing, a dimensional description such as "¼-in tubing" refers to the nominal outside diameter.

Brake hose assembly means a brake hose, with or without armor, equipped with end fittings for use in a brake system, but does not include an air or vacuum assembly prepared by the owner or operator of a used vehicle, by his employee, or by a repair facility, for installation in that used vehicle.

Brake hose end fitting means a coupler, other than a clamp, designed for attachment to the end of a brake hose.

Free length means the linear measurement of hose exposed between the end fittings of a hose assembly in a straight position.

Permanently attached end fitting means an end fitting that is attached by deformation of the fitting about the hose by crimping or swaging, or an end fitting that is attached by use of a sacrificial sleeve or ferrule that requires replacement each time a hose assembly is rebuilt.

Preformed means a brake hose that is manufactured with permanent bends and is shaped to fit a specific vehicle without further bending.

Rupture means any failure that results in separation of a brake hose from its end fitting or in leakage.

Vacuum tubing connector means a flexible conduit of vacuum that (i) connects metal tubing to metal tubing in a brake system, (ii) is attached without end fittings, and (iii) when installed, has an unsupported length less than the total length of those portions that cover the metal tubing.

S5. Requirements—hydraulic brake hose, brake hose assemblies, and brake hose end fittings.

S5.1 Construction. (a) Each hydraulic brake hose assembly shall have permanently attached brake hose end fittings which are attached by deformation of the fitting about the hose by crimping or swaging.

(b) Each hydraulic brake hose assembly that is equipped with a permanent supplemental support integrally attached to the assembly and is manufactured as a replacement for use on a vehicle not equipped, as an integral part of the vehicle's original design, with a means of attaching the support to the vehicle shall be equipped with a bracket that is integrally attached to the supplemental support and that adapts the vehicle to properly accept this type of brake hose assembly.

S5.2 Labeling.

S5.2.1 Each hydraulic brake hose, except hose sold as part of a motor vehicle, shall have at least two clearly identifiable stripes of at least one-sixteenth of an inch in width, placed on opposite sides of the brake hose parallel to its longitudinal axis. One stripe may be interrupted by the information required by S5.2.2, and the other stripe may be interrupted by additional information at the manufacturer's option. However, hydraulic brake hose manufactured for use only in an assembly whose end fittings prevent its installation in a twisted orientation in either side of the vehicle, need not meet the requirements of S5.2.1.

S5.2.2 Each hydraulic brake hose shall be labeled, or cut from bulk hose that is labeled, at intervals of not more than 6 inches, measured from the end of one leg-end to the beginning of the next, in block capital letters and numerals at least one-eighth of an inch high, with the information listed in paragraphs (a) through (e) of this section. The information need not be present on hose that is sold as part of a brake hose assembly or a motor vehicle.

(a) The symbol DOT, constituting a certification by the hose manufacturer that the hose conforms to all applicable motor vehicle safety standards.

Regulations

(b) A designation that identifies the manufacturer of the hose, which shall be filed in writing with: Office of Vehicle Safety Compliance, Equipment Division NVS-222, National Highway Traffic Safety Administration, 400 Seventh St. SW., Washington, DC 20590. The marking may consist of a designation other than block capital letters required by S5.2.2.

(c) The month, day, and year, or the month and year, of manufacture, expressed in numerals. For example, 10/1/96 means October 1, 1996.

(d) The nominal inside diameter of the hose expressed in inches or fractions of inches, or in millimeters followed by the abbreviation "mm."

(e) Either "HR" to indicate that the hose is regular expansion hydraulic hose or "HL" to indicate that the hose is low expansion hydraulic hose.

S5.2.3 Package labeling for brake hose assemblies designed to be used with a supplemental support

(a) Each hydraulic brake hose assembly that is equipped with a permanent supplemental support integrally attached to the assembly and is manufactured as a replacement assembly for a vehicle equipped, as an integral part of the vehicle's original design, with a means of attaching the support to the vehicle shall be sold in a package that is marked or labeled as follows: "FOR USE ON [*insert Manufacturer, Model Name*] ONLY";

(b) Each hydraulic brake hose assembly that is equipped with a permanent supplemental support integrally attached to the assembly and is manufactured as a replacement for use on a vehicle not equipped, as an integral part of the vehicle's original design, with a means of attaching the support to the vehicle shall comply with paragraphs (a)(1) and (2) of this section:

(1) Be sold in a package that is marked or labeled as follows: "FOR USE ONLY WITH A SUPPLEMENTAL SUPPORT."

(2) Be accompanied by clear, detailed instructions explaining the proper installation of the brake hose and the supplemental support bracket to the vehicle and the consequences of not attaching the supplemental support bracket to the vehicle. The instructions shall be printed on or included in the package specified in paragraph (a)(1) of this section.

S5.2.4 Each hydraulic brake hose assembly, except those sold as part of a motor vehicle, shall be labeled by means of a band around the brake hose assembly as specified in this paragraph or, at the option of the manufacturer, by means of labeling as specified in S5.2.4.1.

The band may at the manufacturer's option be attached so as to move freely along the length of the assembly, as long as it is retained by the end fittings. The band shall be etched, embossed, or stamped in block capital letters, numerals or symbols at least one-eighth of an inch high with the following information:

(a) The symbol DOT constituting certification by the hose assembler that the hose assembly conforms to all applicable motor vehicle safety standards.

(b) A designation that identifies the manufacturer of the hose assembly, which shall be filed in writing with: Office of Vehicle Safety Compliance, Equipment Division NVS-222, National Highway Traffic Safety Administration, 400 Seventh St. SW., Washington, DC 20590. The designation may consist of block capital letters, numerals or a symbol.

S5.2.4.1 At least one end fitting of a hydraulic brake hose assembly shall be etched, stamped or embossed with a designation at least one-sixteenth of an inch high that identifies the manufacturer of the hose assembly and is filed in accordance with S5.2.4(b).

S5.3 Test requirements. A hydraulic brake hose assembly or appropriate part thereof shall be capable of meeting any of the requirements set forth under this heading, when tested under the conditions of S13 and the applicable procedures of S6. However, a particular hose assembly or appropriate part thereof need not meet further requirements after having been subjected to and having met the constriction requirement (S5.3.1) and any one of the requirements specified in S5.3.2 through S5.3.13.

S5.3.1 Constriction. Except for that part of an end fitting which does not contain hose, every inside diameter of any section of a hydraulic brake hose assembly shall be not less than 64 percent of the nominal inside diameter of the brake hose (S6.12).

S5.3.2 Expansion and burst strength. The maximum expansion of a hydraulic brake hose assembly at 1,000 psi, 1,500 psi and 2,900 psi shall not exceed the values specified in Table I (S6.1), except that a brake hose larger than $\frac{3}{16}$ inch or 5 mm is not subject to the 2,900 psi expansion test requirements. The hydraulic brake hose assembly shall then withstand water pressure of 4,000 psi for 2 minutes without rupture, and then shall not rupture at less than 7,000 psi for a $\frac{1}{8}$ inch, 3 mm, or smaller diameter hose, or at less than 5,000 psi for a hose with a diameter larger than $\frac{1}{8}$ inch or 3 mm (S6.2).

TABLE I.—MAXIMUM EXPANSION OF FREE LENGTH BRAKE HOSE, CC/FT

Hydraulic brake hose, inside diameter	Test pressure					
	1,000 psi		1,500 psi		2,900 psi	
	Regular expansion hose	Low expansion hose	Low expansion hose	Regular expansion hose	Regular expansion hose	Low expansion hose
$\frac{1}{8}$ inch, or 3mm, or less . . .	0.66	0.33	0.79	0.42	1.21	0.61
$>\frac{1}{8}$ inch or 3mm, to $\frac{3}{16}$ inch, or 5 mm.	0.86	0.55	1.02	0.72	1.67	0.91
$>\frac{3}{16}$ inch, or 5	1.04	0.82	1.30	1.17	*	*

Vehicle Maintenance Pro

S5.3.3 Whip resistance. A hydraulic brake hose assembly shall not rupture when run continuously on a flexing machine for 35 hours (S6.3).

S5.3.4 Tensile strength. A hydraulic brake hose assembly shall withstand a pull of 325 pounds without separation of the hose from its end fittings during a slow pull test, and shall withstand a pull of 370 pounds without separation of the hose from its end fittings during a fast pull test (S6.4).

S5.3.5 Water absorption and burst strength. A hydraulic brake hose assembly, after immersion in water for 70 hours (S6.5), shall withstand water pressure of 4,000 psi for 2 minutes, and then shall not rupture at less than 5,000 psi (S6.2).

S5.3.6 Water absorption and tensile strength. A hydraulic brake hose assembly, after immersion in water for 70 hours (S6.5), shall withstand a pull of 325 pounds without separation of the hose from its end fittings during a slow pull test, and shall withstand a pull of 370 pounds without separation of the hose from its end fittings during a fast pull test (S6.4).

S5.3.7 Water absorption and whip resistance. A hydraulic brake hose assembly, after immersion in water for 70 hours (S6.5), shall not rupture when run continuously on a flexing machine for 35 hours (S6.3).

S5.3.8 Low-temperature resistance. A hydraulic brake hose conditioned at a temperature between minus 49 degrees Fahrenheit (minus 45 degrees Celsius) and minus 54 degrees Fahrenheit (minus 48 degrees Celsius) for 70 hours shall not show cracks visible without magnification when bent around a cylinder as specified in S6.6 (S6.6).

S5.3.9 Brake fluid compatibility, constriction, and burst strength. Except for brake hose assemblies designed for use with mineral or petroleum-based brake fluids, a hydraulic brake hose assembly shall meet the constriction requirement of S5.3.1 after having been subjected to a temperature of 248 degrees Fahrenheit (120 degrees Celsius) for 70 hours while filled with SAE RM-66-04 "Compatibility Fluid," as described in Appendix B of SAE Standard J1703 JAN95 (incorporated by reference, see §571.5). It shall then withstand water pressure of 4,000 psi for 2 minutes and thereafter shall not rupture at less than 5,000 psi (S6.2 except all sizes of hose are tested at 5,000 psi).

S5.3.10 Ozone resistance. A hydraulic brake hose shall not show cracks visible under 7-power magnification after exposure to ozone for 70 hours at 104° F. (S6.8).

S5.3.11 Dynamic Ozone Test. A hydraulic brake hose shall not show cracks visible without magnification after having been subjected to a 48-hour dynamic ozone test (S6.9).

S5.3.12 High temperature impulse test. A brake hose assembly tested under the conditions in S6.10:

- (a) Shall withstand pressure cycling for 150 cycles, at 295 degrees Fahrenheit (146 degrees Celsius) without leakage;
- (b) Shall not rupture during a 2- minute, 4,000 psi pressure hold test, and;
- (c) Shall not burst at a pressure less than 5,000 psi.

S5.3.13 End fitting corrosion resistance. After 24 hours of exposure to salt spray, a hydraulic brake hose end fitting shall show no base metal corrosion on the end fitting surface except where crimping or the application of labeling information has caused displacement of the protective coating (S6.11).

S6. Test procedures—Hydraulic brake hose, brake hose assemblies, and brake hose end fittings.

S6.1. Expansion test.

S6.1.1 Apparatus. Utilize a test apparatus (as shown in Figure 1) which consists of:

- (a) Source for required fluid pressure;
- (b) Test fluid of water without any additives and free of gases;
- (c) Reservoir for test fluid;
- (d) Pressure gauges;
- (e) Brake hose end fittings in which to mount the hose vertically; and
- (f) Graduate burette with 0.05 cc increments.

Fig. 1. Expansion Test Apparatus

S6.1.2 Preparation.

- (a) Measure the free length of the hose assembly.
- (b) Mount the hose so that it is in a vertical straight position without tension when pressure is applied.
- (c) fill the hose with test fluid and bleed all gases from the system.
- (d) Close the valve to the burette and apply 1,500 psi for 10 seconds; then release pressure.

S6.1.3 Calculation of expansion at 1,000, 1,500 psi, and 2,900 psi.

- (a) Adjust the fluid level in the burette to zero.
- (b) Close the valve to the burette, apply pressure at the rate of 15,000 psi per minute, and seal 1,000 psi in

Regulations

the hose (1,500 psi in the second series, and 2,900 psi in the third series).

(c) After 3 seconds open the valve to the burette for 10 seconds and allow the fluid in the expanded hose to rise into the burette.

(d) Repeat the procedure in steps (b) and (c) twice. Measure the amount of test fluid which has accumulated in the burette as a result of the three applications of pressure.

(e) Calculate the volumetric expansion per foot by dividing the total accumulated test fluid by 3 and further dividing by the free length of the hose in feet.

S6.2 Burst strength test.

(a) Connect the brake hose to a pressure system and fill it completely with water, allowing all gases to escape.

(b) Apply water pressure of 4,000 psi at a rate of 15,000 psi per minute.

(c) After 2 minutes at 4,000 psi, increase the pressure at the rate of 15,000 psi per minute until the pressure exceeds 5,000 psi for a brake hose larger than $\frac{1}{8}$ inch or 3 mm diameter, or until the pressure exceeds 7,000 psi for a brake hose of $\frac{1}{8}$ inch, 3 mm, or smaller diameter.

S6.3 Whip resistance test.

S6.3.1 Apparatus. Utilize test apparatus that is dynamically balanced and includes:

(a) A movable header consisting of a horizontal bar equipped with capped end fittings and mounted through bearings at each end to points 4 inches from the center of two vertically rotating disks whose edges are in the same vertical plane;

(b) An adjustable stationary header parallel to the movable header in the same horizontal plane as the centers of the disks, and fitted with open end fittings;

(c) An elapsed time indicator; and

(d) A source of water pressure connected to the open end fittings.

S6.3.2 Preparation.

(a) Except for the supplemental support specified in S6.3.2(d), remove all external appendages including, but not limited to, hose armor, chafing collars, mounting brackets, date band and spring guards.

(b) Measure the hose free length.

(c) Mount the hose in the whip test machine, introducing slack as specified in Table II for the size hose tested, measuring the projected length parallel to the axis of the rotating disks. The manufacturer may, at his option, adapt the fitting attachment points to permit mounting hose assemblies equipped with angled or other special fittings in the same orientation as hose assemblies equipped with straight fittings.

(d) In the case of a brake hose assembly equipped with a permanent supplemental support integrally attached to the assembly, the assembly may be mounted using the supplemental support and associated means of simulating its attachment to the vehicle. Mount the supplemental support in the same vertical and horizontal planes as the stationary header end of the whip test fixture described in S6.3.1(b). Mount or attach the supplemental support so that it is positioned in accordance with the

recommendation of the assembly manufacturer for attaching the supplemental support on a vehicle.

TABLE II—HOSE LENGTHS

Free length between end fittings, inches	Slack, inches	
	$\frac{1}{8}$ inch or 3 mm hose or less	More than $\frac{1}{8}$ inch or 3 mm hose
8 to 15- $\frac{1}{2}$, inclusive	1.750	
10 to 15- $\frac{1}{2}$, inclusive		1,000
Over 15- $\frac{1}{2}$ to 19 inclusive.....	1.250	
Over 19 to 24, inclusive	0.750	

S6.3.3 Operation.

(a) Apply 235 psi water pressure and bleed all gases from the system.

(b) Drive the movable head at 800 rpm.

S6.4 Tensile strength test. Utilize a tension testing machine conforming to the requirements of ASTM E4-03 (incorporated by reference, see §571.5) and provided with a recording device to measure the force applied.

S6.4.1 Preparation. Mount the hose assembly to ensure straight, evenly distributed machine pull.

S6.4.2 Operation. (a) Conduct the slow pull test by applying tension at a rate of 1 inch per minute travel of the moving head until separation occurs.

(b) Conduct the fast pull test by applying tension at a rate of 2 inches per minute travel of the moving head until separation occurs.

S6.5 Water absorption sequence tests. (a) Prepare three brake hose assemblies and measure the free length of the hose assemblies.

(b) Immerse the brake hose assemblies in distilled water at 185 degrees Fahrenheit (85 degrees Celsius) for 70 hours. Remove the brake hose assemblies from the water and condition in air at room temperature for 30 minutes.

(c) Conduct the tests in S6.2, S6.3, and S6.4, using a different hose for each sequence.

S6.6 Low temperature resistance test.

S6.6.1 Preparation.

(a) Remove hose armor, if any, and condition the hose in a straight position in air at a temperature between minus 49 degrees Fahrenheit and minus 54 degrees Fahrenheit (minus 45 degrees Celsius and minus 48 degrees Celsius) for 70 hours.

(b) Condition a cylinder in air at a temperature between minus 49 degrees Fahrenheit and minus 54 degrees Fahrenheit (minus 45 degrees Celsius and minus 48 degrees Celsius) for 70 hours, using a cylinder of 2 $\frac{1}{2}$ inches in diameter for tests of hose less than $\frac{1}{8}$ inch or 3 mm, 3 inches in diameter for tests of $\frac{1}{8}$ inch or 3 mm hose, 3 $\frac{1}{2}$ inches in diameter for tests of $\frac{3}{16}$ to $\frac{1}{4}$ inch hose or 4 mm to 6 mm hose, and 4 inches in diameter for tests of hose greater than $\frac{1}{4}$ inch or 6 mm in diameter.

S6.6.2 Flexibility testing. Bend the conditioned hose 180 degrees around the conditioned cylinder at a steady rate in a period of 3 to 5 seconds. Examine without magnification for cracks.

Vehicle Maintenance Pro

S6.7 Brake fluid compatibility test.

S6.7.1 Preparation.

(a) Attach a hose assembly below a 1-pint reservoir filled with 100 ml. of SAE RM-66-04 Compatibility Fluid as shown in Figure 2.

(b) Fill the hose assembly with brake fluid, seal the lower end, and place the test assembly in an oven in a vertical position.

Fig. 2. Brake Fluid Compatibility Apparatus

S6.7.2 Oven treatment. (a) Condition the hose assembly at 200° F. for 70 hours.

(b) Cool the hose assembly at room temperature for 30 minutes.

(c) Drain the brake hose assembly, immediately determine that every inside diameter of any section of the hose assembly, except for that part of an end fitting which does not contain hose, is not less than 64 percent of the nominal inside diameter of the hose, and conduct the test specified in S6.2.

S6.8 Ozone resistance test. Utilize a cylinder with a diameter eight times the nominal outside diameter of the brake hose excluding armor.

S6.8.1 Preparation. After removing any armor, bind a hydraulic brake hose 360 around the cylinder. In the case of hose shorter than the circumference of the cylinder, bend the hose so that as much of its length as possible is in contact.

S6.8.2 Exposure to ozone.

(a) Condition the hose on the cylinder in air at room temperature for 24 hours.

(b) Immediately thereafter, condition the hose on the cylinder for 70 hours in an exposure chamber having an ambient air temperature of 104 degrees Fahrenheit (40 degrees Celsius) during the test and containing air mixed with ozone in the proportion of 100 parts of ozone per 100 million parts of air by volume.

(c) Examine the hose for cracks under 7-power magnification, ignoring areas immediately adjacent to or within the area covered by binding.

S6.9 Dynamic Ozone Test.

S6.9.1 Apparatus. Utilize a test apparatus shown in Figure 3 which is constructed so that:

(a) It has a fixed pin with a vertical orientation over which one end of the brake hose is installed.

(b) It has a movable pin that is oriented 30 degrees from vertical, with the top of the movable pin angled towards the fixed pin. The moveable pin maintains its orientation to the fixed pin throughout its travel in the horizontal plane. The other end of the brake hose is installed on the movable pin.

Regulations

Figure 3. Dynamic Ozone Test Apparatus

S6.9.2 Preparation. (a) Precondition the hose assembly by laying it on a flat surface in an unstressed condition, at room temperature, for 24 hours.

(b) Cut the brake hose assembly to a length of 8.6 inches (218 mm), such that no end fittings remain on the cut hose.

(c) Mount the brake hose onto the test fixture by fully inserting the fixture pins into each end of the hose. Secure the hose to the fixture pins using a band clamp at each end of the hose.

(d) Place the test fixture into an ozone chamber

(e) Stabilize the atmosphere in the ozone chamber so that the ambient temperature is 104°F (40 degrees Celsius) and the air mixture contains air mixed with ozone in the proportion of 100 parts of ozone per 100 million parts of air by volume. This atmosphere is to remain stable throughout the remainder of the test.

(f) Begin cycling the movable pin at a rate of 0.3 Hz. Continue the cycling for 48 hours.

(g) At the completion of 48 hours of cycling, remove the test fixture from the ozone chamber. Without removing the hose from the test fixture, visually examine the hose for cracks without magnification, ignoring areas immediately adjacent to or within the area covered by the band clamps. Examine the hose with the movable pin at any point along its travel.

S6.10 High temperature impulse test.

S6.10.1 Apparatus. (a) A pressure cycling machine to which one end of the brake hose assembly can be attached, with the entire hose assembly installed vertically inside of a circulating air oven. The machine shall be capable of increasing the pressure in the hose from zero psi to 1600

psi, and decreasing the pressure in the hose from 1600 psi to zero psi, within 2 seconds.

(b) A circulating air oven that can reach a temperature of 295 degrees Fahrenheit (146 degrees Celsius) within 30 minutes, and that can maintain a constant 295 degrees F (146 degrees Celsius) thereafter, with the brake hose assembly inside of the oven and attached to the pressure cycling machine.

(c) A burst test apparatus to conduct testing specified in S6.2

S6.10.2 Preparation. (a) Connect one end of the hose assembly to the pressure cycling machine and plug the other end of the hose. Fill the pressure cycling machine and hose assembly with SAE RM-66-04 "Compatibility Fluid," as described in Appendix B of SAE Standard J1703 JAN95 (incorporated by reference, see §571.5) and bleed all gases from the system.

(b) Place the brake hose assembly inside of the circulating air oven in a vertical position. Increase the oven temperature to 295 degrees F (146 degrees Celsius) and maintain this temperature throughout the pressure cycling test.

(c) During each pressure cycle, the pressure in the hose is increased from zero psi to 1600 psi and held constant for 1 minute, then the pressure is decreased from 1600 psi to zero psi and held constant for 1 minute. Perform 150 pressure cycles on the brake hose assembly.

(d) Remove the brake hose assembly from the oven, disconnect it from the pressure cycling machine, and drain the fluid from the hose. Cool the brake hose assembly at room temperature for 45 minutes.

(e) Wipe the brake hose using acetone to remove residual Compatibility Fluid. Conduct the burst strength

Vehicle Maintenance Pro

test in S6.2, except all sizes of hose are tested at 5,000 psi.

S6.11 End fitting corrosion test. Utilize the apparatus described in ASTM B117-03 (incorporated by reference, see §571.5).

S6.11.1 Construction. *Construct the salt spray chamber so that:*

- (a) The construction material does not affect the corrosiveness of the fog.
- (b) The hose assembly is supported or suspended 30 degrees from the vertical and parallel to the principal direction of the horizontal flow of fog through the chamber.
- (c) The hose assembly does not contact any metallic material or any material capable of acting as a wick
- (d) Condensation which falls from the assembly does not return to the solution reservoir for respraying.
- (e) Condensation from any source does not fall on the brake hose assemblies or the solution collectors.
- (f) Spray from the nozzles is not directed onto the hose assembly.

S6.11.2 Preparation. (a) Plug each end of the hose assembly.

(b) Mix a salt solution five parts by weight of sodium chloride to 95 parts of distilled water, using sodium chloride substantially free of nickel and copper, and containing on a dry basis not more than 0.1 percent of sodium iodide and not more than 0.3 percent total impurities. Ensure that the solution is free of suspended solids before the solution is atomized.

(c) After atomization at 95 degrees Fahrenheit (35 degrees Celsius), ensure that the collected solution is in the PH range of 6.5 to 7.2. Make the PH measurements at 77 degrees Fahrenheit (28 degrees Celsius).

(d) Maintain a compressed air supply to the nozzle or nozzles free of oil and dirt and between 10 and 25 psi.

S6.11.3 Operation. Subject the brake hose assembly to the salt spray continuously for 24 hours.

(a) Regulate the mixture so that each collector will collect from 1 to 2 milliliters of solution per hour for each 80 square centimeters of horizontal collecting area.

(b) Maintain exposure zone temperature at 95 degrees Fahrenheit (35 degrees Celsius).

(c) Upon completion, remove the salt deposit from the surface of the hose by washing gently or dipping in clean running water not warmer than 100 degrees Fahrenheit (38 degrees Celsius) and then drying immediately.

S6.12 Constriction test. Brake hose constriction test requirements shall be met using at least one of the methods specified in S6.12.1, S6.12.2, or S6.12.3.

S6.12.1 Plug gauge. (a) Utilize a plug gauge as shown in Figure 4. Diameter "A" is equal to 64 percent of the nominal inside diameter of the hydraulic brake hose being tested.

(b) Brake hose assemblies that are to be used for additional testing have constriction testing only at each end fitting. Other brake hose assemblies may be cut into 3-inch lengths to permit constriction testing of the entire assembly. Hose assemblies with end fittings that do not

permit entry of the gauge (*e.g.*, restrictive orifice or banjo fitting) are cut 3 inches from the point at which the hose terminates in the end fitting and then tested from the cut end.

(c) Hold the brake hose in a straight position and vertical orientation.

(d) Place the spherical end of the plug gauge just inside the hose or end fitting. If the spherical end will not enter the hose or end fitting using no more force than gravity acting on the plug gauge, this constitutes failure of the constriction test.

(e) Release the plug gauge. Within 3 seconds, the plug gauge shall fall under the force of gravity alone up to the handle of the gauge. If the plug gauge does not fully enter the hose up to the handle of the gauge within three seconds, this constitutes failure of the constriction test.

S6.12.2 Extended plug gauge. (a) The test in 6.12.1 may be conducted with an extended plug gauge to enable testing of the entire brake hose from one end fitting, without cutting the brake hose. The extended plug gauge weight and spherical diameter specifications are as shown in Figure 4, but the handle portion of the gauge may be deleted and the gauge length may be greater than 3 inches.

(b) The required performance of the extended plug gauge in S6.12.1(e) is that after the plug gauge is released, the extended plug gauge shall fall under the

Regulations

force of gravity alone at an average rate of 1 inch per second until the spherical diameter of the extended gauge passes through all portions of the brake hose assembly containing hose. If the extended plug gauge

does not pass through all portions of the brake hose assembly containing hose at an average rate of 1 inch per second, this constitutes failure of the constriction test.

Figure 4. Constriction Test Plug Gauge

S6.12.3 Drop ball test. (a) Utilize a rigid spherical ball with a diameter equal to 64 percent of the nominal inside diameter of the hydraulic brake hose being tested. The weight of the spherical ball shall not exceed 2 ounces (57 grams).

(b) Hold the brake hose in a straight position and vertical orientation.

(c) Hold the ball just above the end fitting.

(d) Release the ball. The ball shall fall under the force of gravity alone completely through all portions of the brake hose assembly containing hose, at an average rate of 1 inch per second. Failure of the ball to pass completely through all portions of the brake hose assembly containing hose, at an average rate of 1 inch per second, constitutes failure of the constriction test.

S7. Requirements—Air brake hose, brake hose assemblies, and brake hose end fittings.

S7.1 Construction. Each air brake hose assembly shall be equipped with permanently attached brake hose end fittings or reusable brake hose end fittings. Each air brake hose constructed of synthetic or natural elastomeric rubber shall conform to the dimensional requirements specified in Table III, except for brake hose manufactured in metric sizes.

Vehicle Maintenance Pro

⁽¹⁾ Notes: Type A, sizes 3/8, 7/16, and 1/2 Special can be assembled with reusable end fittings. All sizes can be assembled using permanently-attached (crimped) end fittings.

⁽²⁾ Types AI and AII, all sizes, can be assembled with reusable or permanently-attached (crimped) end fittings.

S7.2 Labeling

S7.2.1 Hose. Each air brake hose shall be labeled, or cut from bulk hose that is labeled, at intervals of not more than 6 inches, measured from the end of one leg-end to the beginning of the next, in block capital letters and numerals at least one-eighth of an inch high, with the information listed in paragraphs (a) through (e) of this section. The information need not be present on hose that is sold as part of a brake hose assembly or a motor vehicle.

(a) The symbol DOT, constituting a certification by the hose manufacturer that the hose conforms to all applicable motor vehicle safety standards.

(b) A designation that identifies the manufacturer of the hose, which shall be filed in writing with: Office of Vehicle Safety Compliance, Equipment Division NVS-222, National Highway Traffic Safety Administration, 400 Seventh St. SW., Washington, DC 20590. The designation may consist of block capital letters, numerals, or a symbol.

(c) The month, day, and year, or the month and year, of manufacture, expressed in numerals. For example, 10/1/96 means October 1, 1996.

(d) The nominal inside diameter of the hose expressed in inches or fractions of inches or in millimeters. The abbreviation “mm” shall follow hose sizes that are expressed in millimeters. (Examples: 3/8, 1/2 (1/2SP in the case of 1/2 inch special air brake hose), 4mm, 6mm.)

(e) The type designation corresponding to the brake hose dimensions in Table III. Type A shall be labeled with the letter “A”, Type AI shall be labeled with the letters “AI”, and type AII shall be labeled with the letters “AII”. Metric air brake hose shall be labeled with the letter “A.”

S7.2.2 End fittings. Except for an end fitting that is attached by deformation of the fitting about a hose by crimping or swaging, at least one component of each air brake hose fitting shall be etched, embossed, or stamped

in block capital letters and numerals at least one-sixteenth of an inch high with the following information:

(a) The symbol DOT, constituting a certification by the manufacturer of that component that the component conforms to all applicable motor vehicle safety standards.

(b) A designation that identifies the manufacturer of that component of the fitting, which shall be filed in writing with: Office of Vehicle Safety Compliance, Equipment Division NVS-222, National Highway Traffic Safety Administration, 400 Seventh St. S.W., Washington, DC 20590. The designation may consist of block capital letters, numerals, or a symbol.

(c) The letter “A” shall indicate intended use in air brake systems. In the case of an end fitting intended for use in a reusable assembly with brake hose subject to Table III, “AI” or “AII” shall indicate use with Type I or Type II hose, respectively.

(d) The nominal inside diameter of the hose to which the fitting is properly attached expressed in inches or fractions of inches or in millimeters. (See examples in S7.2.1 (d).) The abbreviation “mm” shall follow hose sizes that are expressed in millimeters.

S7.2.3 Assemblies. Each air brake hose assembly made with end fittings that are attached by crimping or swaging, except those sold as part of a motor vehicle, shall be labeled by means of a band around the brake hose assembly as specified in this paragraph or, at the option of the manufacturer, by means of labeling as specified in S7.2.3.1. The band may at the manufacturer’s option be attached so as to move freely along the length of the assembly, as long as it is retained by the end fittings. The band shall be etched, embossed, or stamped in block capital letters, numerals or symbols at least one-eighth of an inch high, with the following information:

Regulations

(a) The symbol DOT, constituting certification by the hose assembler that the hose assembly conforms to all applicable motor vehicle safety standards.

(b) A designation that identifies the manufacturer of the hose assembly, which shall be filed in writing with: Office of Crash Avoidance Standards, Vehicle Dynamics Division, National Highway Traffic Safety Administration, 400 Seventh Street SW., Washington, DC 20590. The designation may consist of block capital letters, numerals or a symbol.

S7.2.3.1 At least one end fitting of an air brake hose assembly made with end fittings that are attached by crimping or swaging shall be etched, stamped or embossed with a designation at least one-sixteenth of an inch high that identifies the manufacturer of the hose assembly and is filed in accordance with S7.2.3(b).

S7.3 Test requirements. Each air brake hose assembly or appropriate part thereof shall be capable of meeting any of the requirements set forth under this heading, when tested under the conditions of S13 and the applicable procedures of S8. However, a particular hose assembly or appropriate part thereof need not

meet further requirements after having met the constriction requirement (S7.3.1) and then having been subjected to any one of the requirements specified in S7.3.2 through S7.3.13.

S7.3.1 Constriction. Every inside diameter of any section of an air brake hose assembly shall not be less than 66 percent of the nominal inside diameter of the brake hose. (S8.14)

S7.3.2 High temperature resistance. An air brake hose shall not show external or internal cracks, charring, or disintegration visible without magnification when straightened after being bent for 70 hours at 212 degrees Fahrenheit (100 degrees Celsius) over a small test cylinder having the radius specified in Table IV for the size of hose tested. (S8.1)

S7.3.3 Low temperature resistance. The inside and outside surfaces of an air brake hose shall not show cracks as a result of conditioning at minus 40 degrees Fahrenheit (minus 40 degrees Celsius) for 70 hours when bent around a large test cylinder having the radius specified in Table IV for the size of hose tested (S8.2).

TABLE IV—AIR BRAKE HOSE DIAMETERS AND TEST CYLINDER RADII

Nominal hose inside diameter, inches ¹	3/16	1/4	5/16	3/8	13/32	7/16, 1/2	5/8
Nominal hose inside diameter, millimeters ¹	4, 5	6	8		10	12	16
Small test cylinder, radius in inches (millimeters) ²	1 (25)	1½ (38)	1¾ (45)	1¾ (45)	17/8 (48)	2 (51)	2½ (64)
Large test cylinder, radius in inches (millimeters) ³	2 (51)	2½ (64)	3 (76)	3½ (89)	3½ (89)	4 (102)	4½ (114)

Notes:

¹ These sizes are listed to provide test cylinder radii for brake hoses manufactured in these sizes. They do not represent conversions.

² Small test cylinders are used for the high temperature resistance test.

³ Large test cylinders are used for the low temperature resistance, ozone resistance, and adhesion of wire-reinforced hose tests.

S7.3.4 Oil resistance. After immersion in ASTM No. 3 oil for 70 hours at 212°F. the volume of a specimen prepared from the inner tube and cover of an air brake hose shall not increase more than 100 percent (S8.3).

S7.3.5 Ozone resistance. An air brake hose assembly shall not show cracks visible under 7-power magnification after exposure to ozone for 70 hours at 104 degrees Fahrenheit (40 degrees Celsius) when bent around a test cylinder of the radius specified in Table IV for the size of hose tested (S8.4).

S7.3.6 Length change. An air brake hose shall not contract in length more than 7 percent nor elongate more than 5 percent when subjected to air pressure of 200 psi (S8.5).

S7.3.7 Adhesion. (a) Except for hose reinforced by wire, an air brake hose shall withstand a tensile force of 8 pounds per inch of length before separation of adjacent layers (S8.6).

(b) An air brake hose reinforced by wire shall permit a steel ball to roll freely along the entire length of the inside of the hose when the hose is subjected to a vacuum of 25 inches of Hg and bent around a test cylinder (S8.13).

S7.3.8 Flex strength and air pressure. An air brake hose assembly of the length specified in the table accompanying Figure 5, when subjected to a flex test and internal pressure cycling, shall be capable of having its internal pressure increased from zero to 140 psi within 2 minutes with pressurized air supplied through an orifice (S8.7).

S7.3.9 Corrosion resistance and burst strength. An air brake hose assembly exposed to salt spray shall not rupture when exposed to hydrostatic pressure of 900 psi (S8.8).

S7.3.10 Tensile strength. An air brake hose assembly designed for use between a frame and axle or between a towed and towing vehicle shall withstand, without separation of the hose from its end fittings, a pull of 250 pounds if it is ¼ inch, 6 mm, or less in nominal inside diameter, or a pull of 325 pounds if it is larger than ¼ inch or 6 mm in nominal inside diameter. An air brake hose assembly designed for use in any other application shall withstand, without separation of the hose from its end fittings, a pull of 50 pounds if it is ¼ inch, 6 mm, or less in nominal inside diameter, 150 pounds if it is larger than ¼ inch or 6 mm and equal to or smaller than ½ inch or 12 mm in nominal inside diameter, or

Vehicle Maintenance Pro

325 pounds if it is larger than ½ inch or 12 mm in nominal inside diameter (S8.9).

S7.3.11 Water absorption and tensile strength. After immersion in distilled water for 70 hours, an air brake hose assembly designed for use between a frame and axle or between a towed and a towing vehicle shall withstand, without separation of the hose from its end fittings, a pull of 250 pounds if it is ¼ inch or less or 6 mm or less in nominal inside diameter, or a pull of 325 pounds if it is larger than ¼ inch or 6 mm in nominal inside diameter. After immersion in distilled water for 70 hours, an air brake hose assembly designed for use in any other application shall withstand, without separation of the hose from its end fittings, a pull of 50 pounds if it is ¼ inch or 6 mm or less in nominal inside diameter, 150 pounds if it is larger than ¼ inch or 6 mm and equal to or smaller than ½ inch or 12 mm in nominal inside diameter, or 325 pounds if it is larger than ½ inch or 12 mm in nominal inside diameter. (S8.10)

S7.3.12 Zinc chloride resistance. The outer cover of an air brake hose shall not show cracks visible under 7-power magnification after immersion in a 50 percent zinc chloride aqueous solution for 200 hours (S8.11).

S7.3.13 End fitting corrosion resistance. After 24 hours of exposure to salt spray, air brake hose end fittings shall show no base metal corrosion on the end fitting surface except where crimping or the application of labeling information causes a displacement of the protective coating.

S8. Test procedures—Air brake hose, brake hose assemblies, and brake hose end fittings.

S8.1 High temperature resistance test.

(a) Utilize a small test cylinder with a radius specified in Table IV for the size of hose tested.

(b) Bind the hose around the cylinder and condition it in an air oven for 70 hours at 212 degrees Fahrenheit (100 degrees Celsius).

(c) Cool the hose to room temperature, remove it from the cylinder and straighten it.

(d) Without magnification, examine the hose externally and cut the hose lengthwise and examine the inner tube.

S8.2 Low temperature resistance test.

(a) Utilize a large test cylinder with a radius specified in Table IV for the size of hose tested.

(b) Condition the cylinder and the brake hose, in a straight position, in a cold box at minus 40° F. for 70 hours.

(c) With the hose and cylinder at minus 40 degrees Fahrenheit (minus 40 degrees Celsius), bend the hose 180 degrees around the cylinder at a steady rate in a period of 3 to 5 seconds. Remove the hose from the test cylinder and visibly examine the exterior of the hose for cracks without magnification.

(d) Allow the hose to warm at room temperature for 2 hours. All reusable end fittings are removed from the hose. All permanently-attached end fittings are cut away from the hose. Cut through one wall of the hose longitudinally along its entire length. Unfold the hose to permit examination of the interior surface. Visibly

examine the interior of the hose for cracks without magnification.

S8.3 Oil resistance test. Utilize three test specimens and average the results.

S8.3.1 Preparation. Fashion a test specimen by cutting a rectangular block 2 inches long and not less than one-third of an inch in width, having a thickness of not more than one-sixteenth inch, from the brake hose and buff the specimen on both faces to ensure smooth surfaces.

S8.3.2 Measurement.

(a) Weigh each specimen to the nearest milligram in air (W_1) and in distilled water (W_2) at room temperature. If wetting is necessary to remove air bubbles, dip the specimen in acetone and thoroughly rinse it with distilled water.

(b) Immerse each specimen in ASTM IRM 903 oil for 70 hours at 212 degrees Fahrenheit (100 degrees Celsius) and then cool in ASTM IRM 903 oil at room temperature for 30 to 60 minutes.

(c) Dip the specimen quickly in acetone and blot it lightly with filter paper.

(d) Weigh each specimen in a tared weighing bottle (W_3) and in distilled water (W_4) within five minutes of removal from the cooling liquid.

(e) Calculate the percentage increase in volume follows:

$$\text{Percent of increase} = [(W_3 - W_4) - (W_1 - W_2)] / (W_1 - W_2) \times 100$$

S8.4 Ozone resistance test. Conduct the test specified in S6.8, using air brake hose, except use the large test cylinder specified in Table IV for the size of hose tested.

S8.5 Length change test.

(a) Position a test hose in a straight, horizontal position, and apply air pressure of 10 psi thereto.

(b) Measure the hose to determine original free length.

(c) Without releasing the 10 psi, raise the air pressure to the test hose to 200 psi.

(d) Measure the hose under 200 psi to determine final free length. An elongation or contraction is an increase or decrease, respectively, in the final free length from the original free length of the hose.

S8.6 Adhesion test for air brake hose not reinforced by wire.

S8.6.1 Apparatus. A tension testing machine that is power-driven and that applies a constant rate of extension is used for measuring the force required to separate the layers of the test specimen. The apparatus is constructed so that:

(a) The recording head includes a freely rotating form with an outside diameter substantially the same as the inside diameter of the hose specimen to be placed on it.

(b) The freely rotating form is mounted so that its axis of rotation is in the plane of the ply being separated from the specimen and so that the applied force is perpendicular to the tangent of the specimen circumference at the line of separation.

Regulations

(c) The rate of travel of the power-actuated grip is a uniform one inch per minute and the capacity of the machine is such that maximum applied tension during the test is not more than 85 percent nor less than 15 percent of the machine's rated capacity.

(d) The machine produces a chart with separation as one coordinate and applied tension as the other.

S8.6.2 Preparation.

(a) Cut a test specimen of 1 inch or more in length from the hose to be tested and cut the layer to be tested of that test specimen longitudinally along its entire length to the level of contact with the adjacent layer.

(b) Peel the layer to be tested from the adjacent layer to create a flap large enough to permit attachment of the power-actuated clamp of the apparatus.

(c) Mount the test specimen on the freely rotating form with the separated layer attached to the power-actuated clamp.

S8.6.3 [Reserved]

S8.6.4 Calculations.

(a) The adhesion value shall be the minimum force recorded on the chart excluding that portion of the chart which corresponds to the initial and final 20 percent portion along the displacement axis.

(b) Express the force in pounds per inch of length.

S8.7 Flex strength and air pressure test.

S8.7.1 Apparatus. A flex testing machine with a fixed hose assembly attachment point and a movable hose assembly attachment point, which meets the dimensional requirements of Figure 5 for the size of hose being tested. The attachment points connect to the end fittings on the hose assembly without leakage and, after the hose assembly has been installed for the flex test, are restrained from rotation. The movable end has a linear travel of 6 inches and a cycle rate of 100 cycles per minute. The machine is capable of increasing the air pressure in the hose assembly from zero to 150 psi within 2 seconds, and decreasing the air pressure in the hose assembly from 150 to zero psi within 2 seconds.

Figure 5. Flex Test Apparatus

TABLE ACCOMPANYING FIGURE 5.—DIMENSIONS IN INCHES (MILLIMETERS)

Free hose length	Nominal hose inside diameter	Dimensions							
		Position "1"				Position "2"			
		A	B	C	R ⁽¹⁾	A	B	C	R ⁽¹⁾
10.00 (254) ..	3/16, 1/4	3.00 (76)	2.75 (70)	3.75 (95)	1.40 (34)	3.00 (76)	2.75 (70)	3.75 (95)	1.20 (30)

Note (1): This is an approximate average radius.

S8.7.2 Preparation. (a) Lay the hose material on a flat surface in an unstressed condition. Apply a perma-

nent marking line along the centerline of the hose on the uppermost surface.

Vehicle Maintenance Pro

(b) Prepare the hose assembly with a free length as shown in the table accompanying Figure 5. The end fittings shall be attached according to the end fitting manufacturer's instructions.

(c) Plug the ends of the hose assembly and conduct the salt spray test in S6.11 using an air brake hose assembly. Remove the plugs from the end fittings.

(d) Within 168 hours of completion of the salt spray test, expose the hose assembly to an air temperature of 212 degrees Fahrenheit (100 degrees Celsius) for 70 hours, with the hose in a straight position. Remove the hose and cool it at room temperature for 2 hours. Within 166 hours, subject the hose to the flexure test in S8.7.2(e).

(e) Install the hose assembly on the flex testing machine as follows. With the movable hose attachment point at the mid point of its travel, attach one end of the hose to the movable attachment point with the marked line on the hose in the uppermost position. Attach the other end of the hose to the fixed attachment point allowing the hose to follow its natural curvature.

(f) Cycle the air pressure in the hose by increasing the pressure in the hose from zero psi to 150 psi and holding constant for one minute, then decreasing the pressure from 150 psi to zero psi and holding constant for one minute. Continue the pressure cycling for the duration of the flex testing. Begin the flex testing by cycling the movable attachment point through 6 inches of travel at a rate of 100 cycles per minute. Stop the flex testing and pressure cycling after one million flex cycles have been completed.

(g) Install an orifice with a hole diameter of 0.0625 inches and a thickness of 0.032 inches in the air pressure supply line to the hose assembly. Provide a gauge or other means to measure air pressure in the hose assembly. Regulate the supply air pressure to the orifice to 150 psi.

(h) Apply 150 psi air pressure to the orifice. After 2 minutes have elapsed, measure the air pressure in the brake hose assembly, while pressurized air continues to be supplied through the orifice.

S8.8 Corrosion resistance and burst strength test.

(a) Conduct the test specified in S6.11 using an air brake hose assembly. Remove the plugs from the ends of the hose assembly.

(b) Fill the hose assembly with water, allowing all gases to escape. Apply water pressure at a uniform rate of increase of approximately 1,000 psi per minute until the hose ruptures.

S8.9 Tensile strength test. Utilize a tension testing machine conforming to the requirements of ASTM E4-03 (incorporated by reference, see §571.5) and provided with a recording device to measure the force applied.

(a) Attach an air brake hose assembly to the testing machine to permit straight, even, machine pull on the hose. Use adapters to mount hose assemblies equipped with angled end fittings so that the hose is in a straight position when installed on the machine.

(b) Apply tension at a rate of 1 inch per minute travel of the moving head until separation occurs.

S8.10 Water Absorption and tensile strength test. Immerse an air brake hose assembly in distilled water at room temperature for 70 hours. Thirty minutes after removal from the water, conduct the test specified in S8.9.

S8.11 Zinc chloride resistance test. Immerse an air brake hose in a 50 percent zinc chloride aqueous solution at room temperature for 200 hours. Remove it from the solution and examine it under 7-power magnification for cracks.

S8.12 End fitting corrosion resistance test. Conduct the test specified in S6.11 using an air brake hose assembly.

S8.13 Adhesion test for air brake hose reinforced by wire. (a) Place a steel ball with a diameter equal to 73 percent of the nominal inside diameter of the hose being tested inside of the hose. Plug one end of the hose. Attach the other end of the hose to a source of vacuum.

(b) Subject the hose to a vacuum of 25 inches of Hg for five minutes. With the vacuum still applied to the hose, bend the hose 180 degrees around a large test cylinder with a radius specified in Table IV for the size of hose tested. At the location of this bend, bend the hose 180 degrees around the test cylinder in the opposite direction.

(c) With the vacuum still applied to the hose, return the hose to a straight position. Attempt to roll the ball inside the hose using gravity from one end of the hose to the other end.

S8.14 Constriction test. Perform the constriction test in S6.12 using an air brake hose, except that the spherical diameter "A" of the plug gauge in Figure 4, or the diameter of the rigid spherical ball in S6.12.3(a), shall be 66 percent of the nominal inside diameter of the air brake hose being tested.

S9. Requirements—vacuum brake hose, brake hose assemblies, and brake hose end fittings.

S9.1 Labeling.

S9.1.1 Hose. Each vacuum brake hose shall be labeled, or cut from bulk hose that is labeled, at intervals of not more than 6 inches, measured from the end of one legend to the beginning of the next, in block capital letters and numerals at least one-eighth of an inch high, with the information listed in paragraphs (a) through (e) of this section. The information need not be present on hose that is sold as part of a brake hose assembly or a motor vehicle.

(a) The symbol DOT, constituting a certification by the hose manufacturer that the hose conforms to all applicable motor vehicle safety standards.

(b) A designation that identifies the manufacturer of the hose, which shall be filed in writing with: Office of Crash Avoidance Standards, Vehicle Dynamics Division, National Highway Traffic Safety Administration, 400 Seventh Street, SW., Washington, DC 20590. The designation may consist of block capital letters, numerals or a symbol.

(c) The month, day, and year, or the month and year, of manufacture, expressed in numerals. For example, 10/1/96 means October 1, 1996.

Regulations

(d) The nominal inside diameter of the hose expressed in inches or fractions of inches or in millimeters, or the nominal outside diameter of plastic tubing expressed in inches or fractions of inches or in millimeters followed by the letters OD. The abbreviation “mm” shall follow hose sizes that are expressed in millimeters. (Example of inside diameter: $\frac{7}{32}$, $\frac{1}{4}$, 4 mm. Example of outside diameter: $\frac{1}{4}$ OD, 12 mm OD.)

(e) The letters “VL” or “VH” shall indicate that the component is a light-duty vacuum brake hose or heavy-duty vacuum brake hose, respectively.

S9.1.2 End fittings. Except for an end fitting that is attached by heat shrinking or by interference fit with plastic vacuum hose or that is attached by deformation of the fitting about a hose by crimping or swaging, at least one component of each vacuum brake hose fitting shall be etched, embossed, or stamped in block capital letters and numerals at least one-sixteenth of an inch high with the following information:

(a) The symbol DOT, constituting a certification by the manufacturer of that component that the component conforms to all applicable motor vehicle safety standards.

(b) A designation that identifies the manufacturer of that component of the fitting, which shall be filed in writing with: Office of Crash Avoidance Standards, Vehicle Dynamics Division, National Highway Traffic Safety Administration, 400 Seventh Street, SW., Washington, DC 20590. The designation may consist of block capital letters, numerals or a symbol.

(c) The letters “VL” or “VH” shall indicate that the end fitting is intended for use in a light-duty or heavy-duty vacuum brake system, respectively.

(d) The nominal inside diameter of the hose to which the fitting is properly attached expressed in inches or fractions of inches or in millimeters, or the outside diameter of the plastic tubing to which the fitting is properly attached expressed in inches or fraction of inches or in millimeters followed by the letter OD (See examples in S9.1.1(d)). The abbreviation “mm” shall follow hose sizes that are expressed in millimeters.

S9.1.3 Assemblies. Each vacuum brake hose assembly made with end fittings that are attached by crimping or swaging and each plastic tube assembly made with end fittings that are attached by heat shrinking or dimensional interference fit, except those sold as part of a motor vehicle, shall be labeled by means of a band around the brake hose assembly as specified in this paragraph or, at the option of the manufacturer, by means of labeling as specified in S9.1.3.1. The band may at the manufacturer’s option be attached so as to move freely along the length of the assembly, as long as it is retained by the end fittings. The band shall be etched, embossed, or stamped, in block capital letters, numerals or symbols at least one-eighth of an inch high, with the following information:

(a) The symbol DOT, constituting certification by the hose assembler that the hose assembly conforms to all applicable motor vehicle safety standards.

(b) A designation that identifies the manufacturer of the hose assembly, which shall be filed in writing with: Office of Crash Avoidance Standards, Vehicle Dynamics

Division, National Highway Traffic Safety Administration, 400 Seventh Street SW., Washington, DC 20590. The designation may consist of block capital letters, numerals or a symbol.

S9.1.3.1 At least one end fitting of a vacuum brake hose assembly made with end fittings that are attached by crimping or swaging, or of a plastic tubing assembly made with end fittings that are attached by heat shrinking or dimensional interference fit shall be etched, stamped or embossed with a designation at least one-sixteenth of an inch high that identifies the manufacturer of the hose assembly and is filed in accordance with S9.1.3(b).

S9.2 Test requirements. Each vacuum brake hose assembly or appropriate part thereof shall be capable of meeting any of the requirements set forth under this heading, when tested under the conditions of S13 and the applicable procedures of S10. However, a particular hose assembly or appropriate part thereof need not meet further requirements after having met the constriction requirement (S9.2.1) and then having been subjected to any one of the requirements specified in S9.2.2 through S9.2.10.

S9.2.1 Constriction. Except for that part of an end fitting which does not contain hose, every inside diameter of any section of a vacuum brake hose assembly shall not be less than 75 percent of the nominal inside diameter of the hose if for heavy duty, or 70 percent of the nominal inside diameter of the hose if for light duty (S10.10).

S9.2.2 High temperature resistance. A vacuum brake hose tested under the conditions specified in S10.1:

(a) Shall not have collapse of the outside diameter exceeding 10 percent of the initial outside diameter for a heavy-duty vacuum brake hose, or exceeding 15 percent of the initial outside diameter for a light-duty vacuum brake hose;

(b) Shall not show external cracks, charring, or disintegration visible without magnification, and;

(c) Shall not leak when subjected to a hydrostatic pressure test.

S9.2.3 Low temperature resistance. A vacuum brake hose tested under the conditions specified in S10.2 shall:

(a) Not show cracks visible without magnification after conditioning at minus 40 degrees Fahrenheit (minus 40 degrees Celsius) for 70 hours when bent around a cylinder having the radius specified in Table V for the size hose tested; and

(b) Not leak when subjected to a hydrostatic pressure test (S10.1(e)).

S9.2.4 Ozone resistance. A vacuum brake hose shall not show cracks visible under 7-power magnification after exposure to ozone for 70 hours (S10.3).

S9.2.5 Burst strength. A vacuum brake hose shall not rupture under hydrostatic pressure of 350 psi (S10.4).

S9.2.6 Vacuum. The collapse of the outside diameter of a vacuum brake hose under internal vacuum of 26 inches of Hg. for five minutes shall not exceed one-sixteenth of an inch (S10.5).

Vehicle Maintenance Pro

S9.2.7 Bend. The collapse of the outside diameter of a vacuum brake hose, other than a preformed vacuum brake hose, at the middle point of the test length when

bent until the ends touch shall not exceed the values given in Table V for the size of hose tested (S10.6).

TABLE V—VACUUM BRAKE HOSE TEST REQUIREMENTS

Hose inside diameter*		High temperature resistance		Low temperature resistance		Bend		Deformation—collapsed inside diameter (dimension D), inches
Inches	Millimeters	Hose length, inches	Radius of cylinder, inches	Hose length, inches	Radius of cylinder, inches	Hose length, inches	Maximum collapse of outside inches	
7/32	5	8	1-1/2	17-1/2	3	7	11/64	3/64
1/4	6	9	1-1/2	17-1/2	3	8	3/32	1/16
9/32		9	1-3/4	19	3-1/2	9	12/64	4/64
11/32	8	9	1-3/4	19	3-1/2	11	13/64	5/64
3/8	10	10	1-3/4	19	3-1/2	12	5/32	3/32
7/16		11	2	20-1/2	4	14	17/64	5/64
15/32		11	2	20-1/2	4	14	17/64	5/64
1/2	12	11	2	20-1/2	4	16	7/32	1/8
5/8	16	12	2-1/4	22	4-1/2	22	7/32	5/32
3/4		14	2-1/2	24	5	28	7/32	3/16
1		16	3-1/4	28-1/2	6-1/2	36	9/32	1/4

*These sizes are listed to provide test values for brake hoses manufactured in these sizes. They do not represent conversions.

S9.2.8 Swell and adhesion. Following exposure to Reference Fuel B (as described in ASTM D471-98 (incorporated by reference, see §571.5), every inside diameter of any section of a vacuum brake hose shall not be less than 75 percent of the nominal inside diameter of the hose if for heavy duty, or 70 percent of the nominal inside diameter of the hose if for light duty. The vacuum brake hose shall show no leakage in a vacuum test of 26 inches of Hg for 10 minutes. A vacuum hose that is constructed of two or more layers shall withstand a force of 6 pounds per inch of length before separation of adjacent layers. (S10.7).

S9.2.9 Deformation. A vacuum brake hose shall return to 90 percent of its original outside diameter within 60 seconds after five applications of force as specified in S10.8, except that a wire reinforced hose need only return to 85 percent of its original outside diameter. In the case of a heavy duty hose, the first application of force shall not exceed a peak value of 70 pounds, and the fifth application of force shall reach a peak value of at least 40 pounds. In the case of light duty hose the first application of force shall not exceed a peak value of 50 pounds, and the fifth application of force shall reach a peak value of at least 20 pounds (S10.9).

S9.2.10 End fitting corrosion resistance. After 24 hours of exposure to salt spray, vacuum brake hose end fittings shall show no base metal corrosion of the end fitting surface except where crimping or the application of labeling information has caused displacement of the protective coating. (S10.10).

S10. Test procedures—Vacuum brake hose, brake hose assemblies, and brake hose end fittings.

S10.1 High temperature resistance test. (a) Measure the initial outside diameter of the hose.

(b) Subject the hose to an internal vacuum of 26 inches of Hg at an ambient temperature of 257 degrees Fahrenheit (125 degrees Celsius) for a period of 96 hours.

Remove the hose to room temperature and atmospheric pressure.

(c) Within 5 minutes of completion of the conditioning in S10.1(b), measure the outside diameter at the point of greatest collapse and calculate the percentage collapse based on the initial outside diameter.

(d) Cool the hose at room temperature for 5 hours. Bend the hose around a mandrel with a diameter equal to five times the initial outside diameter of the hose. Examine the exterior of the hose for cracks, charring, or disintegration visible without magnification. Remove the hose from the mandrel.

(e) Fill the hose assembly with water, allowing all gases to escape. Apply water pressure in the hose of 175 psi within 10 seconds. Maintain an internal hydrostatic pressure of 175 psi for one minute and examine the hose for visible leakage.

S10.2 Low temperature resistance test. (a) Conduct the test specified in S8.2(a) through (c) using vacuum brake hose with the cylinder radius specified in Table V for the size of hose tested.

(b) Remove the hose from the test cylinder, warm the hose at room temperature for 5 hours, and conduct the hydrostatic pressure test in S10.1(e).

S10.3 Ozone resistance test. Conduct the test specified in S6.8 using vacuum brake hose.

S10.4 Burst strength test. Conduct the test specified in S8.8 using vacuum brake hose.

S10.5 Vacuum test. Utilize a 12-inch vacuum brake hose assembly sealed at one end.

(a) Measure the hose outside diameter.

(b) Attach the hose to a source of vacuum and subject it to a vacuum of 26 inches of Hg for 5 minutes.

(c) Measure the hose to determine the minimum outside diameter while the hose is still subject to vacuum.

S10.6 Bend test.

Regulations

(a) Bend a vacuum brake hose, of the length prescribed in Table V, in the direction of its normal curvature until the ends just touch as shown in Figure 6.

(b) Measure the outside diameter of the specimen at point A before and after bending.

(c) The difference between the two measurements is the collapse of the hose outside diameter on bending.

Fig. 6—Bend Test of Vacuum Brake Hose.

S10.7 Swell and adhesion test. (a) Fill a specimen of vacuum brake hose 12 inches long with ASTM Reference Fuel B as described in ASTM D471-98 (incorporated by reference, see §571.5).

(b) Maintain reference fuel in the hose under atmospheric pressure at room temperature for 48 hours.

(c) Remove fuel and conduct the constriction test in S10.10.

(d) Attach the hose to a source of vacuum and subject it to a vacuum of 26 inches of Hg for 10 minutes. Remove the hose from the vacuum source.

(e) For a vacuum brake hose constructed of two or more layers, conduct the test specified in S8.6 using the vacuum brake hose.

S10.8 [Reserved]

S10.9 Deformation test. Table VI specifies the test specimen dimensions.

S10.9.1 Apparatus. Utilize a compression device, equipped to measure force of at least 100 pounds, and feeler gages of sufficient length to be passed completely through the test specimen.

S10.9.2 Operation.

(a) Position the test specimen longitudinally in the compression device with the fabric laps not in the line of the applied pressure.

TABLE VI—DIMENSIONS OF TEST SPECIMEN AND FEELER GAGE FOR DEFORMATION TEST

Hose inside diameter*		Specimen dimensions (see Fig. 7)		Feeler gage dimensions	
in.	mm	Depth (inch)	Length (inch)	Width (inch)	Thickness (inch)
7/32	5	3/64	1	1/8	3/64
1/4	6	1/16	1	1/8	1/16
9/32		1/16	1	1/8	1/16
11/32	8	5/64	1	3/16	5/64
3/8	10	3/32	1	3/16	3/32
7/16		5/64	1	1/4	5/64
15/32		5/64	1	1/4	5/64
1/2	12	1/8	1	1/4	1/8
5/8	16	5/32	1	1/4	5/32
3/4		3/16	1	1/4	3/16
1		1/4	1	1/4	1/4

*These sizes are listed to provide test values for brake hoses manufactured in these sizes. They do not represent conversions.

(b) Apply gradually increasing force to the test specimen to compress its inside diameter to that specified in Table VI (dimension D of Figure 7) for the size of hose tested.

Fig. 7. Deformed Specimen of Vacuum Brake Hose

(c) After 5 seconds release the force and record the peak load applied.

(d) Repeat the procedure four times permitting a 10-second recovery period between load applications.

S10.10 End fitting corrosion resistance test. Conduct the test specified in S6.11 using a vacuum brake hose assembly.

S10.11 Constriction test. Perform the constriction test in S6.12 using a vacuum brake hose, except that the spherical diameter "A" of the plug gauge in Figure 4, or the diameter of the rigid spherical ball in S6.12.3(a), shall be 75 percent of the nominal inside diameter of the vacuum brake hose if it is heavy duty, or 70 percent of the nominal inside diameter of the vacuum brake hose if it is light duty.

S11. Requirements—Plastic air brake tubing, plastic air brake tubing assemblies, and plastic air brake tubing end fittings.

S11.1 Construction. Each plastic air brake tubing assembly shall be equipped with permanently attached end fittings or reusable end fittings. Plastic air brake tubing shall conform to the dimensional requirements specified in Table VII. (S12.1)

Vehicle Maintenance Pro

TABLE VII.—PLASTIC AIR BRAKE TUBING DIMENSIONS

S11.2 Labeling.

S11.2.1 Plastic air brake tubing. Plastic air brake tubing shall be labeled, or cut from bulk tubing that is labeled, at intervals of not more than 6 inches, measured from the end of one legend to the beginning of the next, in block capital letters and numerals at least one-eighth of an inch high, with the information listed in paragraphs (a) through (e) of this section. The information need not be present on tubing that is sold as part of a motor vehicle.

(a) The symbol DOT, constituting a certification by the hose manufacturer that the hose conforms to all applicable motor vehicle safety standards.

(b) A designation that identifies the manufacturer of the tubing, which shall be filed in writing with: Office of Vehicle Safety Compliance, Equipment Division NVS-222, National Highway Traffic Safety Administration, 400 Seventh St. SW., Washington, DC 20590. The designation may consist of block capital letters, numerals, or a symbol.

(c) The month, day, and year, or the month and year, of manufacture, expressed in numerals. For example, 10/1/96 means October 1, 1996.

(d) The nominal outside diameter expressed in inches or fractions of inches or in millimeters followed by the letters OD. The abbreviation “mm” shall follow tubing sizes that are expressed in millimeters. (Examples: 3/8 OD, 6 mm OD.)

(e) The letter “A” shall indicate intended use in air brake systems.

S11.2.2 End fittings. Except for an end fitting that is attached by deformation of the fitting about the tubing by crimping or swaging, at least one component of each plastic air brake tubing end fitting shall be etched, embossed, or stamped in block capital letters and numerals at least one-sixteenth of an inch high with the following information:

(a) The symbol DOT, constituting a certification by the manufacturer that the end fitting conforms to all applicable motor vehicle safety standards.

(b) A designation that identifies the manufacturer of the end fitting, which shall be filed in writing with: Office of Vehicle Safety Compliance, Equipment Division NVS-

222, National Highway Traffic Safety Administration, 400 Seventh St. SW., Washington, DC 20590. The designation may consist of block capital letters, numerals, or a symbol.

(c) The letter “A” shall indicate intended use in air brake systems.

(d) The nominal outside diameter of the plastic tubing to which the fitting is properly attached expressed in inches or fractions of inches or in millimeters followed by the letters OD. The abbreviation “mm” shall follow tubing sizes that are expressed in millimeters. (Examples: 3/8 OD, 6 mm OD)

S11.2.3. Assemblies. Each plastic air brake tubing assembly made with end fittings that are attached by crimping or swaging, except those sold as part of a motor vehicle, shall be labeled by means of a band around the brake tubing assembly as specified in this paragraph or, at the option of the manufacturer, by means of labeling as specified in S11.2.3.1. The band may at the manufacturer’s option be attached so as to move freely along the length of the assembly, as long as it is retained by the end fittings. The band shall be etched, embossed, or stamped in block capital letters, numerals or symbols at least one-eighth of an inch high, with the following information:

(a) The symbol DOT, constituting certification by the tubing assembler that the tubing assembly conforms to all applicable motor vehicle safety standards.

Regulations

(b) A designation that identifies the manufacturer of the hose assembly, which shall be filed in writing with: Office of Vehicle Safety Compliance, Equipment Division NVS-222, National Highway Traffic Safety Administration, 400 Seventh St. SW., Washington, DC 20590. The designation may consist of block capital letters, numerals, or a symbol.

S11.2.3.1 At least one end fitting of a plastic air brake tubing assembly made with end fittings that are attached by crimping or swaging shall be etched, stamped, or embossed with a designation at least one-sixteenth of an inch high that identifies the manufacturer of the tubing assembly and is filed in accordance with S11.2.3(b).

S11.3 Test requirements. Each plastic air brake tubing assembly or appropriate part thereof shall be capable of meeting any of the requirements set forth under this heading, when tested under the conditions of S13 and the applicable procedures of S12. However, a particular tubing assembly or appropriate part thereof need not meet further requirements after having met the constriction requirement (S11.3.1) and then having been subjected to any one of the requirements specified in S11.3.2 through S11.3.24. Unless otherwise specified, testing is conducted on a sample of tubing 12 inches in length.

S11.3.1 Constriction. Every inside diameter of any section of a plastic air brake tubing assembly shall not be less than 66 percent of the nominal inside diameter of the brake tubing. (S12.2)

S11.3.2 High temperature conditioning and dimensional stability. Plastic air brake tubing shall conform to the dimensions in Table VII after conditioning in air at 230 degrees Fahrenheit (110 degrees Celsius) for four hours. (S12.3)

S11.3.3 Boiling water conditioning and dimensional stability. Plastic air brake tubing shall conform to the dimensions in Table VII after conditioning in boiling water for two hours. (S12.4)

S11.3.4 Burst Strength. Plastic air brake tubing shall not rupture when subjected to the burst strength pressure in Table VIII for the size of tubing being tested. (S12.5)

S11.3.5 Moisture absorption and burst strength. Plastic air brake tubing shall not rupture when subjected to 80 percent of the burst strength pressure in Table VIII, after the tubing has been dried in an oven and then conditioned in a 100 percent relative humidity atmosphere at 75 degrees Fahrenheit (24 degrees Celsius) for 100 hours. (S12.6)

TABLE VIII.—PLASTIC AIR BRAKE TUBING MECHANICAL PROPERTIES

Notes: (1) Supported bend radius for tests specifying cylinders around which the tubing is bent. (2) Unsupported bend radius for the collapse resistance test in which the tubing is not supported by a cylinder during bending.

S11.3.6 Ultraviolet light resistance. Plastic air brake tubing shall not rupture when subjected to 80 percent of the burst strength pressure in Table VIII for the size of tubing being tested, after being exposed to ultraviolet light for 300 hours and then impacted with a one pound weight dropped from a height of 12 inches. (S12.7)

S11.3.7 Low temperature flexibility. The outer surface of plastic air brake tubing shall not show cracks visible without magnification as a result of conditioning in air at 230 degrees Fahrenheit (110 degrees Celsius) for 24 hours, and then conditioning in air at minus 40 degrees Fahrenheit (minus 40 degrees Celsius) for four hours, and then bending the tubing 180 degrees around a test cylinder having a radius equal to six times the nominal outside diameter of the tubing. (S12.8)

S11.3.8 High temperature flexibility. Plastic air brake tubing shall not rupture or burst when subjected to 80 percent of the burst strength pressure in Table VIII for the size of tubing being tested, after the tubing has been:

(a) Conditioned in air at 230 degrees Fahrenheit (110 degrees Celsius) for 72 hours while bent 180 degrees around a cylinder having a radius equal to the supported bend radius in Table VIII for the size of tubing being tested; and

(b) Cooled to room temperature while remaining on the cylinder, then straightened; and

(c) Bent 180 degrees around the cylinder in the opposite direction of the first bending. (S12.9)

S11.3.9 High temperature resistance. Plastic air brake tubing shall not rupture or burst when subjected to 80 percent of the burst strength pressure in Table VIII for the size of tubing being tested, after the tubing has been conditioned in air at 230 degrees Fahrenheit (110 degrees Celsius) for 72 hours. (S12.10)

S11.3.10 High temperature conditioning, low temperature impact resistance. Plastic air brake tubing shall not rupture or burst when subjected to 80 percent of the burst strength pressure in Table VIII for the size of tubing being tested, after the tubing has been conditioned in air at 230 degrees Fahrenheit (110 degrees Celsius) for 24 hours, then conditioned in air at

Vehicle Maintenance Pro

minus 40 degrees Fahrenheit (minus 40 degrees Celsius) for 4 hours and impacted with a one pound weight dropped from a height of 12 inches. (S12.11)

S11.3.11 Boiling water conditioning, low temperature impact resistance. Plastic air brake tubing shall not rupture when subjected to 80 percent of the burst strength pressure in Table VIII for the size of tubing being tested, after the tubing has been conditioned in boiling water for two hours, then conditioned in air at minus 40 degrees Fahrenheit (minus 40 degrees Celsius) for 4 hours, and then impacted with a one pound weight dropped from a height of 12 inches. (S12.12)

S11.3.12 Zinc chloride resistance. The outer surface of plastic air brake tubing shall not show cracks visible under 7-power magnification after immersion in a 50 percent zinc chloride aqueous solution for 200 hours while bent around a cylinder having a radius equal to the supported bend radius in Table VIII for the size of tubing tested. (S12.13)

S11.3.13 Methyl alcohol resistance. The outer surface of plastic air brake tubing shall not show cracks visible under 7-power magnification after immersion in a 95 percent methyl alcohol aqueous solution for 200 hours while bent around a cylinder having a radius equal to the supported bend radius in Table VIII for the size of tubing tested. (S12.14)

S11.3.14 High temperature conditioning and collapse resistance. The collapse of the outside diameter of plastic air brake tubing shall not exceed twenty percent of the original outside diameter when bent 180 degrees on a holding fixture to the unsupported bend radius specified in Table VIII and conditioned in air at 200 degrees Fahrenheit (93 degrees Celsius) for 24 hours. (S12.15)

S11.3.15 Ozone resistance. The outer surface of plastic air brake tubing shall not show cracks visible under 7-power magnification after exposure to ozone for 70 hours at 104 degrees Fahrenheit (40 degrees Celsius). (S12.16)

S11.3.16 Oil resistance. Plastic air brake tubing shall not rupture when subjected to 80 percent of the burst strength pressure in Table VIII for the size of tubing being tested, after the tubing has been conditioned in ASTM IRM 903 oil at 212 degrees Fahrenheit (100 degrees Celsius) for 70 hours. (S12.17)

S11.3.17 Tensile strength. A plastic air brake tubing assembly designed for use between frame and axle or between a towed and a towing vehicle shall withstand, without separation of the tubing from its end fittings, a pull of 250 pounds if it is $\frac{3}{8}$ inch, 10 mm, or less in nominal outside diameter, or a pull of 325 pounds if it is larger than $\frac{3}{8}$ inch or 10 mm in nominal outside diameter. A plastic air brake tubing assembly designed for use in any other application shall withstand, without separation of the hose from its end fittings, a pull of 35 pounds if it is $\frac{1}{8}$ inch, 3 mm, or less in nominal outside diameter, 40 pounds if it is $\frac{5}{32}$ inch or 4 mm in nominal outside diameter, 50 pounds if it is $\frac{3}{16}$ to $\frac{1}{2}$ inch or 5 mm to 10 mm in nominal outside diameter, 150 pounds if it is $\frac{1}{2}$ to $\frac{5}{8}$ inch or 11 mm to 16 mm in nominal outside diameter, or 325 pounds if it is larger than $\frac{5}{8}$ inch or 16 mm in nominal outside diameter. (S12.18)

S11.3.18 Boiling water conditioning and tensile strength. A plastic air brake tubing assembly when subjected to a tensile pull test shall either elongate 50 percent or withstand the conditioned tensile load in Table VIII without separation from its end fittings, with one end of the assembly conditioned in boiling water for 5 minutes. (S12.19)

S11.3.19 Thermal conditioning and tensile strength. A plastic air brake tubing assembly when subjected to a tensile pull test shall either elongate 50 percent or withstand the conditioned tensile load in Table VIII without separation from its end fittings after the assembly has been subjected to four cycles of conditioning in air at minus 40 degrees Fahrenheit (minus 40 degrees Celsius) for thirty minutes, normalizing at room temperature, conditioning in boiling water for 15 minutes, and normalizing at room temperature. (S12.20)

S11.3.20 Vibration resistance. A plastic air brake tubing assembly with an internal air pressure of 120 psig shall not rupture or leak more than 50 cm³ per minute at a temperature of minus 40 degrees Fahrenheit (minus 40 degrees Celsius) and 25 cm³ per minute at a temperature of 75 degrees Fahrenheit (24 degrees Celsius), after the assembly has been subjected to 1,000,000 cycles of vibration testing with one end of the assembly fixed and the other end stroked $\frac{1}{2}$ -inch at 600 cycles per minute. In addition, end fittings that use a threaded retention nut shall retain at least 20 percent of the original retention nut tightening torque upon completion of the vibration testing. The vibration test shall be conducted in an environmental chamber and the air temperature shall be cycled between minus 40 degrees Fahrenheit (minus 40 degrees Celsius) and 220 degrees Fahrenheit (104 degrees Celsius) during the test. (S12.21)

S11.3.21 End fitting retention. The end fittings of a plastic air brake tubing assembly shall not rupture when the assembly is filled with water and pressurized to the burst strength pressure in Table VIII. (S12.22)

S11.3.22 Thermal conditioning and end fitting retention. The end fittings of a plastic air brake tubing assembly shall not rupture when the tubing assembly is filled with ASTM IRM 903 oil and:

(a) Conditioning in air at 200 degrees Fahrenheit (93 degrees Celsius) for 24 hours with atmospheric pressure inside the tubing assembly; and

(b) Increasing the pressure inside the tubing assembly to 450 psi, and holding this pressure for five minutes while maintaining an air temperature of 200 degrees Fahrenheit (93 degrees Celsius); and

(c) Reducing the pressure inside the tubing assembly to atmospheric and permitting the tubing assembly to cool at 75 degrees Fahrenheit (24 degrees Celsius) for 1 hour; and

(d) Conditioning the tubing assembly in air at minus 40 degrees Fahrenheit (minus 40 degrees Celsius) for 24 hours with atmospheric pressure inside the tubing assembly; and

(e) Increasing the pressure inside the tubing assembly to 450 psi, and holding this pressure for five minutes

Regulations

while maintaining an air temperature of minus 40 degrees Fahrenheit (minus 40 degrees Celsius). (S12.23)

S11.3.23 End fitting serviceability. A plastic air brake end fitting that uses a threaded retention nut shall not rupture or leak more than 25 cm³ per minute when pressurized to 120 psi after five assembly cycles. (S12.24)

S11.3.24 End fitting corrosion resistance. After 24 hours of exposure to salt spray, air brake hose end fittings shall show no base metal corrosion on the end fitting surface except where crimping or the application of labeling information causes a displacement of the protective coating. (S12.25)

S12. Test procedures—Plastic air brake tubing, plastic air brake tubing assemblies, plastic air brake tubing end fittings.

S12.1 Air brake tubing dimensions. Measure the tubing dimensions including wall thickness, inside diameter, and outside diameter, using appropriate metrology apparatus such as micrometers, dial indicators and gauges, or optical comparators. To account for slight out-of-round conditions, diameter measurements may be calculated using the average of the major and minor diameters.

S12.2 Constriction test. Perform the constriction test in S6.12 using an air brake tubing assembly, except that the spherical diameter “A” of the plug gauge in Figure 4, or the diameter of the rigid spherical ball in S6.12.3(a), shall be 66 percent of the nominal inside diameter of the tubing as specified in Table VII.

S12.3 High temperature conditioning and dimensional stability test. (a) Condition the tubing at 230 degrees Fahrenheit (110 degrees Celsius) for 4 hours in an air oven.

(b) Remove the tubing from the oven and allow to cool at room temperature for 30 minutes.

(c) Measure the dimensions of the tubing using the procedure in S12.1.

S12.4 Boiling water conditioning and dimensional stability test. (a) Utilize a container constructed of a nonreactive material large enough so that the tubing to be tested does not touch any surface of the container. Fill container with distilled water.

(b) Slip the tubing over a stainless steel wire for positioning it in the pot.

(c) Bring the water to a boil. Place the tubing in the water and position it so that it does not touch the container. Boil the tubing for two hours. Replenish the water as necessary, adding it slowly so that the water in the pot boils continuously.

(d) Remove the tubing from the water and allow to cool at room temperature for 30 minutes. Wipe off any water that remains on the tubing.

(e) Measure the dimensions of the tubing using the procedure in S12.1.

S12.5 Burst strength test. (a) Utilize an air brake tubing assembly or prepare a 12 inch length of tubing and install end fittings according to the end fitting manufacturer’s instructions.

(b) Plug one end of the assembly, fill it with water, and connect the other end to a source of water pressure. Bleed any air from the assembly and water pressure system.

(c) Increase the water pressure inside the tubing assembly at a rate of 3,000 psi per minute to the burst strength pressure for the size of tubing being tested as specified in Table VIII.

S12.6 Moisture absorption and burst strength. (a) Prepare a sample of tubing twelve inches in length.

(b) Condition the tubing at 230 degrees Fahrenheit (110 degrees Celsius) for 24 hours in an air oven. Remove the tubing from the oven and within 30 seconds, and weigh it to establish the initial weight. The weight shall be measured with a resolution of 0.01 gram; if the scale has a higher resolution, then values of 0.005 gram and above shall be rounded to the nearest 0.01 gram and values below 0.005 gram shall be truncated.

(c) Place the tubing in an environmental chamber and condition it for 100 hours at 100 percent relative humidity and a temperature of 75 degrees Fahrenheit (24 degrees Celsius).

(d) Remove the tubing from the chamber and within a period of 5 minutes, remove all surface moisture from the tubing using cloth and weigh the tubing to establish the conditioned weight. Weight shall be measured to the nearest 0.01 gram as in S12.6(b).

(e) Calculate percentage of moisture absorption as follows: $[(\text{Conditioned Weight} - \text{Initial Weight}) \div (\text{Initial Weight})] \times 100$

(f) Install end fittings according to the end fitting manufacturers instructions.

(g) Conduct the burst strength test in S12.5 except use 80 percent of the burst strength pressure for the size of tubing being tested as specified in Table VIII.

S12.7 Ultraviolet light resistance test. (a) **Apparatus.** An accelerated weathering test machine for ultraviolet light conditioning of plastic air brake tubing. The machine shall be equipped with fluorescent UVA–340 light bulbs and automatic irradiance control. Also utilize an impact test apparatus as shown in Figure 8.

(b) **Test standards.** The testing is in accordance with ASTM G154-00, ASTM G151-97, and ASTM D4329-99 (all incorporated by reference, see §571.5).

(c) **Preparation.** (1) Utilize a 12 inch length of plastic air brake tubing. Mask 1 inch of each end of the tubing where end fittings will be attached using opaque tape.

(2) Attach the tubing to the test rack of the machine, securing it at the ends along the masked sections. Wipe the outside surface of the tubing with acetone to remove any surface contaminants. Place the tubing and rack in the accelerated weathering test machine so that the center of the tubing assembly is approximately in the center of the UV light exposure area of the test machine. (If multiple plastic brake tubing assemblies are tested, then their position in the machine should be rotated according to ASTM D4329–99 S7.4.1, except the rotation shall be each 96 hours instead of weekly.) The distance from the light bulb to the tubing shall be approximately 2 inches. Set the UV irradiance to 0.85 watts per square meter at 340 nm and maintain this level during the testing. Maintain a temperature inside the test chamber of

Vehicle Maintenance Pro

113 degrees Fahrenheit (45 degrees Celsius), and use only atmospheric humidity. Expose the tubing at this UV irradiance level for 300 hours continuously. Remove the tubing from the test chamber.

(3) Place the tubing inside the impact test apparatus, and drop the impactor onto the tubing from a height of 12 inches.

(4) Remove the masking material from the ends of the tubing. Install end fittings according to the end fitting manufacturer's instructions. Conduct the burst strength test in S12.5 except use 80 percent of the burst strength pressure for the size of tubing being tested as specified in Table VIII.

16 mm	16.80	0.661

S12.8 Low temperature flexibility test. (a) Utilize a cylinder having a radius of six times the nominal outside diameter of the tubing.

(b) Condition the tubing in an air oven at 230 degrees Fahrenheit (110 degrees Celsius) for 24 hours. Remove from the oven and cool at room temperature for 30 minutes.

(c) Condition the cylinder and the tubing in an environmental chamber at minus 40 degrees Fahrenheit (minus 40 degrees Celsius) for four hours.

(d) With the tubing and test cylinder at minus 40 degrees Fahrenheit (minus 40 degrees Celsius), bend the tubing 180 degrees around the cylinder at a steady rate in a period of 4 to 8 seconds.

S12.9 High temperature flexibility test. (a) Utilize a cylinder having a radius equal to the supported bend radius in Table VIII for the size of tubing being tested.

(b) Bend the tubing 180 degrees around the cylinder and hold in place with a clamp or other suitable support, applying only enough force on the tubing to hold it in position.

(c) Condition the tubing and cylinder in an air oven at 230 degrees Fahrenheit (110 degrees Celsius) for 72 hours. Remove the tubing and cylinder from the oven and cool at room temperature for two hours.

(d) Remove the clamps or supports from the tubing and straighten the tubing at a steady rate in a period of 4 to 8 seconds.

(e) Rebend the tubing 180 degrees around the cylinder, at the same point but in the opposite direction of the bending in S12.9(b), at a steady rate in a period of 4 to 8 seconds.

(f) Conduct the burst strength test in S12.5 except use 80 percent of the burst strength pressure for the size of tubing being tested as specified in Table VIII.

S12.10 High temperature resistance test. Condition the tubing in an air oven at 230 degrees Fahrenheit (110 degrees Celsius) for 72 hours. Remove the tubing and allow to cool at room temperature for 30 minutes. Conduct the burst strength test in S12.5 except use 80 percent of the burst strength pressure for the size of tubing being tested as specified in Table VIII.

S12.11 High temperature conditioning, low tem-

perature impact resistance test. (a) Apparatus. Utilize an impact test apparatus as shown in Figure 8.

(b) Condition the tubing in an air oven at 230 degrees Fahrenheit (110 degrees Celsius) for 72 hours. Remove the tubing and allow to cool at room temperature for 30 minutes.

(c) Condition the tubing and the impact test apparatus in an environmental chamber at minus 40 degrees Fahrenheit (minus 40 degrees Celsius) for 4 hours.

(d) With the tubing and impact test apparatus at minus 40 degrees Fahrenheit (minus 40 degrees Celsius), place the tubing inside the apparatus and drop the impacter onto the tubing from a height of 12 inches. Remove the tubing from the chamber and allow to warm at room temperature for one hour.

(e) Conduct the burst strength test in S12.5 except use 80 percent of the burst strength pressure for the size of tubing being tested as specified in Table VIII.

S12.12 Boiling water conditioning, low temperature impact resistance test. (a) Apparatus. Utilize an impact test apparatus as shown in Figure 8.

(b) Condition the tubing in boiling water using the test in S12.4 (a) through (d), except that the length of tubing shall be 12 inches.

(c) Condition the tubing and the impact test apparatus in an environmental chamber at minus 40 degrees Fahrenheit (minus 40 degrees Celsius) for 4 hours.

(d) With the tubing and impact test apparatus at minus 40 degrees Fahrenheit (minus 40 degrees Celsius), place the tubing inside the apparatus and drop the impacter onto the tubing from a height of 12 inches. Remove the tubing from the chamber and allow to warm at room temperature for one hour.

(e) Conduct the burst strength test in S12.5 except use 80 percent of the burst strength pressure for the size of tubing being tested as specified in Table VIII.

S12.13 Zinc chloride resistance test. (a) Utilize a cylinder having a radius equal to the supported bend radius in Table VIII for the size of tubing being tested. The cylinder is constructed of a non-reactive material or coated to prevent chemical reaction with zinc chloride. The length of the tubing sample is long enough so that its ends will not be submerged during the immersion in zinc chloride, or the ends of the tubing are plugged to keep the zinc chloride from entering the tubing.

(b) Bend the tubing 180 degrees around the cylinder and hold in place with a clamp or other suitable support constructed of non-reactive materials, applying only enough force on the tubing to hold it in position.

(c) Immerse the tubing and cylinder in a 50 percent zinc chloride aqueous solution at room temperature for 200 hours.

(d) Remove the tubing and cylinder from the solution. While still on the test cylinder, inspect the tubing under 7-power magnification for cracks.

S12.14 Methyl alcohol resistance. (a) Utilize a cylinder having a radius equal to the supported bend radius in Table VIII for the size of tubing being tested. The cylinder is constructed of a nonreactive material or coated to prevent chemical reaction with methyl alcohol.

Vehicle Maintenance Pro

(b) Bend the tubing 180 degrees around the cylinder and hold in place with a clamp or other suitable support constructed of non-reactive materials, applying only enough force on the tubing to hold it in position. The ends of the tubing may be shortened so that they will be fully submerged in the methyl alcohol.

(c) Immerse the tubing and cylinder in a 95 percent methyl alcohol aqueous solution at room temperature for 200 hours.

(d) Remove the tubing and cylinder from the solution. While still on the test cylinder, inspect the tubing under 7-power magnification for cracks.

S12.15 High temperature conditioning and collapse resistance test. (a) **Apparatus.** A holding device consisting of two vertical pins affixed to a flat, horizontal plate. Each pin projects 1 inch above the top surface of the plate. The diameter of each pin is approximately equal to the inside diameter of the tubing being tested. Using the unsupported bend radius for the size of tubing being tested from Table VIII, the distance between the pin centerlines is equal to: $[2 \times \text{unsupported bend radius}] + [\text{nominal OD of tubing}]$

(b) **Preparation.** (1) Use the unsupported bend radius for the size of tubing being tested from Table VIII and cut the tubing to the following length: $[3.14 \times [\text{unsupported bend radius}]] + [10 \times [\text{nominal tubing OD}]] + 2 \text{ inches}$ or $[3.14 \times [\text{unsupported bend radius}]] + [10 \times [\text{nominal tubing OD}]] + 50 \text{ mm}$

(2) Place a reference mark at the center of the sample. At this mark, measure the initial outside diameter of the tubing. If the tubing is slightly out-of-round, use the elliptical minor diameter as the initial outside diameter.

(3) Install the tubing completely over the pins of the holding device so that the tubing is bent 180 degrees. If the tubing has a natural curvature, the tubing shall be bent in the direction of the natural curvature.

(4) Condition the holding device and tubing in an air oven at 200 degrees Fahrenheit (93 degrees Celsius) for 24 hours. Remove the holding device and tubing and allow to cool at room temperature for thirty minutes.

(5) With the tubing still mounted to the holding device, measure the elliptical minor diameter of the tubing at the reference mark to determine the final outside diameter.

(c) **Calculation.** Calculate the percentage collapse of the outside diameter of the tubing as follows: $([\text{Initial Outside Diameter} - \text{Final Outside Diameter}] \div [\text{Initial Outside Diameter}]) \times 100$

S12.16 Ozone resistance test. Conduct the test specified in S6.8 using plastic air brake tubing.

S12.17 Oil resistance test. (a) Utilize a plastic air brake tubing assembly or prepare a 12 inch length of tubing and install end fittings according to the end fitting manufacturer's instructions.

(b) Immerse the tubing in ASTM IRM 903 oil at 212 degrees Fahrenheit (100 degrees Celsius) for 70 hours. Remove and allow to cool at room temperature for 30 minutes. Wipe any excess oil from the tubing assembly.

(c) Conduct the burst strength test in S12.5 except use 80 percent of the burst strength pressure for the size of

tubing being tested as specified in Table VIII and, at the manufacturer's option, oil may be used as the test medium instead of water.

S12.18 Tensile strength test. Conduct the test in S8.9 using a plastic air brake tubing assembly or an assembly prepared from a 12 inch length of air brake tubing with end fittings installed according to the end fitting manufacturer's instructions.

S12.19 Boiling water conditioning and tensile strength. (a) **Apparatus.** Use a tension testing machine as specified in S8.9. The lower attachment point of the machine is equipped with a heated, open-top container that is water tight. The inside of the container (lower attachment point) and upper attachment point of the machine have provisions to quickly attach a brake hose assembly for tensile testing.

(b) **Preparation.** Prepare an air brake tubing assembly with a free length of 6 inches (six inches of exposed tubing between the end fittings), with the end fittings installed in accordance with the end fitting manufacturer's instructions. If necessary install adapters on the end fittings to permit quick attachment to the machine, to keep water from entering the tubing assembly, and to ensure that the tubing assembly is in a straight position when installed on the machine. Fill the container with distilled water such that the lower 4 inches of exposed tubing will be submerged when the brake tubing assembly is installed on the machine. Heat the water until it boils. Then quickly install the plastic air brake tubing assembly on the machine with the lower end of the tubing assembly in the boiling water. After the water has boiled continuously for 5 minutes, apply tension to the tubing assembly at a rate of 1 inch per minute travel of the moving head until either the conditioned tensile load in Table VIII for the size of tubing being tested is reached or the free length of the tubing assembly reaches 9 inches, whichever occurs first.

S12.20 Thermal conditioning and tensile strength. (a) **Apparatus.** Use a tension testing machine as specified in S8.9.

(b) **Preparation.** Prepare an air brake tubing assembly with a free length of 6 inches (six inches of exposed tubing between the end fittings), with the end fittings installed in accordance with the end fitting manufacturer's instructions. If necessary install adapters on the end fittings to permit attachment to the machine, to keep water from entering the tubing assembly, and/or to ensure that the tubing assembly is in a straight position when installed on the machine. Subject the tubing assembly to four complete cycles of the following sequence:

(1) Condition the tubing assembly in an environmental chamber at minus 40 degrees Fahrenheit (minus 40 degrees Celsius) for 30 minutes. Remove from the chamber and allow to warm at room temperature for 30 minutes.

(2) Condition the tubing assembly by submerging it in boiling water for 15 minutes. Remove and allow to cool at room temperature for 30 minutes. Install the tubing assembly on the tension testing machine and apply tension to the tubing assembly at a rate of one inch per

Regulations

minute travel of the moving head until either the conditioned tensile load in Table VIII for the size of tubing being tested is reached or the free length of the tubing assembly reaches 9 inches, whichever occurs first.

S12.21 Vibration resistance test. (a) **Apparatus.** A vibration testing machine that supports a brake tubing assembly by its end fittings in approximately a straight line and includes the following features:

(1) One tubing assembly attachment point is fixed and the other moves in a plane perpendicular to a line projected between the attachment points. The movable attachment point moves in a linear direction and travels $\frac{1}{2}$ inch total and at its midpoint of travel falls on a line projected between the attachment points. The movable attachment point has a cycle rate of 600 cycles per minute.

(2) The distance between the attachment points is adjustable to compensate for varying lengths of brake tubing assemblies.

(3) The actuating mechanism for the movable attachment point is balanced to prevent introduction of machine vibration into the brake tubing assembly.

(4) The machine has a compressed air supply system that pressurizes the air brake tubing assembly through one fitting while the other fitting is plugged. The machine's compressed air supply system includes a pressure gauge or monitoring system and an air flow meter.

(5) The machine is constructed so that an air brake tubing assembly mounted on it can be conditioned in an environmental test chamber.

(b) **Preparation.** (1) Prepare an air brake tubing assembly with a free length of 18 inches (18 inches of exposed tubing between the end fittings), with the end fittings installed in accordance with the end fitting manufacturer's instructions. Record the initial tightening torque for an end fitting that uses a threaded retaining nut.

(2) Install the air brake tubing assembly on the vibration testing machine and, with the movable attachment point at the midpoint of its travel, adjust the distance between the attachment points so that they are $\frac{1}{2}$ inch closer together than the distance at which the tubing assembly is taut.

(3) With the tubing assembly inside the environmental chamber, apply compressed air to the tubing assembly at a regulated pressure of 120 psi and maintain the supply of air to the tubing assembly for the duration of the test. Set the temperature of the environmental chamber to 220 degrees Fahrenheit (104 degrees Celsius) and initiate cycling of the movable attachment point. After 250,000 cycles, set the temperature of the environmental chamber to minus 40 degrees Fahrenheit (minus 40 degrees Celsius). After 500,000 cycles, set the temperature of the environmental chamber to 220 degrees Fahrenheit (104 degrees Celsius). After 750,000 cycles, set the temperature of the environmental chamber to minus 40 degrees Fahrenheit (minus 40 degrees Celsius). Measure the air flow rate just prior to 1,000,000 cycles and if the compressed air flow rate supplied to the air brake tubing assembly exceeds 50 cubic centimeters per minute this constitutes failure of

the test. Stop the cycling at 1,000,000 cycles and set the environmental chamber temperature to 75 degrees Fahrenheit (24 degrees Celsius), while air pressure is still supplied to the air brake tubing assembly. After one hour, measure the compressed air flow rate supplied to the air brake tubing assembly and if the rate exceeds 25 cubic centimeters per minute this constitutes failure of the test.

(4) For end fittings that use a threaded retaining nut, apply 20 percent of the original tightening torque as recorded in S12.21(b)(1). If the retention nut visibly moves, this constitutes a failure of the test.

S12.22 End fitting retention test. (a) Utilize an air brake tubing assembly or prepare a 12 inch length of tubing and install end fittings according to the end fitting manufacturer's instructions.

(b) Plug one end of the assembly, fill it with water, and connect the other end to a source of water pressure. Bleed any air from the assembly and water pressure system.

(c) Increase the pressure inside the tubing assembly at a rate of 3,000 psi per minute to 50 percent of the burst strength pressure for the size of tubing being tested as specified in Table VIII. Hold the pressure constant for 30 seconds.

(d) Increase the pressure inside the tubing assembly at a rate of 3,000 psi per minute to the burst strength pressure for the size of tubing being tested as specified in Table VIII.

S12.23 Thermal conditioning and end fitting retention test. (a) **Apparatus.** A source of hydraulic pressure that includes a pressure gauge or monitoring system, uses ASTM IRM 903 oil, and is constructed so that an air brake tubing assembly mounted to it can be conditioned in an environmental test chamber.

(b) **Preparation.** Utilize an air brake tubing assembly or prepare a 12 inch length of tubing and install end fittings according to the end fitting manufacturer's instructions. Attach one end of the assembly to the hydraulic pressure supply and plug the other end of the assembly, fill the assembly with ASTM IRM 903 oil and bleed any air from the assembly, and place the tubing assembly inside an environmental chamber. Conduct the following tests:

(1) With atmospheric pressure applied to the oil inside the tubing assembly, set the environmental chamber temperature to 200 degrees Fahrenheit (93 degrees Celsius) and condition the tubing assembly for 24 hours.

(2) With the temperature maintained at 200 degrees Fahrenheit (93 degrees Celsius), increase the oil pressure inside the tubing assembly at a rate of 3,000 psi per minute to 450 psi, and hold this pressure for 5 minutes.

(3) Decrease the oil pressure inside the tubing assembly at a rate of 3,000 psi per minute to atmospheric pressure and set the temperature of the environmental chamber to 75 degrees Fahrenheit (24 degrees Celsius). Condition the tubing assembly at this temperature for 1 hour.

Vehicle Maintenance Pro

(4) Set the temperature of the environmental chamber to minus 40 degrees Fahrenheit (minus 40 degrees Celsius) and condition the tubing assembly for 24 hours.

(5) With the temperature maintained at minus 40 degrees Fahrenheit (minus 40 degrees Celsius), increase the hydraulic pressure inside the tubing assembly at a rate of 3,000 psi per minute to 450 psi, and hold this pressure for 5 minutes.

S12.24 End fitting serviceability. (a) **Apparatus.** A source of air pressure that includes a pressure gauge or monitoring system and is equipped with a mass air flow meter.

(b) **Preparation.** Prepare a 12-inch length of tubing and plug one end. Assemble the end fitting with the threaded retention nut on the other end of the tubing according to the end fitting manufacturer's instructions, then disassemble the fitting. Repeat the assembly and disassembly sequence three more times, and then reassemble the end fitting (five total assembly steps).

(c) Attach the end fitting with the threaded retention nut to the source of air pressure. Pressurize the tubing at a rate of 3,000 psi per minute to a pressure of 120 psi. If the end fitting leaks, measure and record the leakage rate using the mass air flow meter.

S12.25 End fitting corrosion resistance. Utilize an air brake tubing assembly or prepare a 12-inch length of tubing and install end fittings according to the end fitting manufacturer's instructions. Conduct the test specified in S6.11 using a plastic air brake tubing assembly.

S13. Test Conditions. Each hose assembly or appropriate part thereof shall be able to meet the requirements of S5, S7, S9, and S11, under the following conditions.

S13.1 The temperature of the testing room is 75 degrees Fahrenheit (24 degrees Celsius).

S13.2 The brake hoses and brake hose assemblies are at least 24 hours old, and unused.

S13.3 Specified test pressures are gauge pressures (psig).

§571.108 Standard No. 108; Lamps, reflective devices, and associated equipment.

S1. Scope. This standard specifies requirements for original and replacement lamps, reflective devices, and associated equipment.

S2. Purpose. The purpose of this standard is to reduce traffic accidents and deaths and injuries resulting from traffic accidents, by providing adequate illumination of the roadway, and by enhancing the conspicuity of motor vehicles on the public roads so that their presence is perceived and their signals understood, both in daylight and in darkness or other conditions of reduced visibility.

S3. Application. This standard applies to:

S3.1 Passenger cars, multipurpose passenger vehicles, trucks, buses, trailers (except pole trailers and trailer converter dollies), and motorcycles;

S3.2 Retroreflective sheeting and reflex reflectors manufactured to conform to S8.2 of this standard; and

S3.3 Lamps, reflective devices, and associated equipment for replacement of like equipment on vehicles to which this standard applies.

S4. Definitions.

Aiming plane means a plane defined by the surface of the three aiming pads on the lens.

Aiming reference plane means a plane which is perpendicular to the longitudinal axis of the vehicle and tangent to the forwardmost aiming pad on the headlamp.

Aiming screws are the horizontal and vertical adjusting screws with self-locking features used to aim and retain a headlamp unit in the proper position.

Axis of reference means the characteristic axis of the lamp for use as the direction of reference ($H = 0^\circ$, $V = 0^\circ$) for angles of field for photometric measurements and for installing the lamp on the vehicle.

Backup lamp means a lamp or lamps which illuminate the road to the rear of a vehicle and provide a warning signal to pedestrians and other drivers when the vehicle is backing up or is about to back up.

Beam contributor means an indivisible optical assembly including a lens, reflector, and light source, that is part of an integral beam headlighting system and contributes only a portion of a headlamp beam.

Cargo lamp is a lamp that is mounted on a multipurpose passenger vehicle, truck, or bus for the purpose of providing illumination to load or unload cargo.

Clearance lamps are lamps which show to the front or rear of the vehicle, mounted on the permanent structure of the vehicle as near as practicable to the upper left and right extreme edges to indicate the overall width and height of the vehicle.

Coated materials means a material which has a coating applied to the surface of the finished sample to impart some protective properties. Coating identification means a mark of the manufacturer's name, formulation designation number, and recommendations for application.

Color Fundamental definitions of color are expressed by Chromaticity Coordinates according to the CIE 1931 Standard Colorimetric System, as described in the CIE 1931 Chromaticity Diagram (incorporated by reference, see §571.5).

Color bleeding means the migration of color out of a plastic part onto the surrounding surface.

Combination clearance and side marker lamps are single lamps which simultaneously fulfill the requirements of clearance and side marker lamps.

Combination headlamp means a headlamp that is a combination of two different headlamp types chosen from a type F sealed beam headlamp, an integral beam headlamp, or a replaceable bulb headlamp.

Cracking means a separation of adjacent sections of a plastic material with penetration into the specimen.

Crazing means a network of apparent fine cracks on or beneath the surface of materials.

Cutoff means a generally horizontal, visual/optical aiming cue in the lower beam that marks a separation between areas of higher and lower luminance.

Regulations

Daytime running lamps (DRLs) are steady burning lamps that are used to improve the conspicuity of a vehicle from the front and front sides when the regular headlamps are not required for driving.

Delamination means a separation of the layers of a material including coatings.

Design voltage means the voltage used for design purposes.

Direct reading indicator means a device that is mounted in its entirety on a headlamp or headlamp aiming or headlamp mounting equipment, is part of a VHAD, and provides information about headlamp aim in an analog or digital format.

Effective light-emitting surface means that portion of a lamp that directs light to the photometric test pattern, and does not include transparent lenses, mounting hole bosses, reflex reflector area, beads or rims that may glow or produce small areas of increased intensity as a result of uncontrolled light from an area of $\frac{1}{2}^\circ$ radius around a test point.

Effective projected luminous lens area means the area of the orthogonal projection of the effective light-emitting surface of a lamp on a plane perpendicular to a defined direction relative to the axis of reference. Unless otherwise specified, the direction is coincident with the axis of reference.

Exposed means material used in lenses or optical devices exposed to direct sunlight as installed on the vehicle.

Filament means that part of the light source or light emitting element(s), such as a resistive element, the excited portion of a specific mixture of gases under pressure, or any part of other energy conversion sources, that generates radiant energy which can be seen.

Flash means a cycle of activation and deactivation of a lamp by automatic means continuing until stopped either automatically or manually.

Fully opened means the position of the headlamp concealment device in which the headlamp is in the design open operating position.

H-V axis means the line from the center of the principal filament of a lamp to the intersection of the horizontal (H) and vertical (V) lines of a photometric test screen.

Haze means the cloudy or turbid appearance of an otherwise transparent specimen caused by light scattered from within the specimen or from its surface.

Headlamp means a lighting device providing an upper and/or a lower beam used for providing illumination forward of the vehicle.

Headlamp concealment device means a device, with its operating system and components, that provides concealment of the headlamp when it is not in use, including a movable headlamp cover and a headlamp that displaces for concealment purposes.

Headlamp mechanical axis means the line formed by the intersection of a horizontal and a vertical plane through the light source parallel to the longitudinal axis of the vehicle. If the mechanical axis of the headlamp is not at the geometric center of the lens, then the location will be indicated by the manufacturer on the headlamp.

Headlamp test fixture means a device designed to support a headlamp or headlamp assembly in the test position specified in the laboratory tests and whose mounting hardware and components are those necessary to operate the headlamp as installed in a motor vehicle.

High-mounted stop lamp means a lamp mounted high and possibly forward of the tail, stop, and rear turn signal lamps intended to give a steady stop warning through intervening vehicles to operators of following vehicles.

Identification lamps are lamps used in groups of three, in a horizontal row, which show to the front or rear or both, having lamp centers spaced not less than [6 in] 15.2 mm nor more than [12 in] 30.4 mm apart, mounted on the permanent structure as near as practicable to the vertical centerline and the top of the vehicle to identify certain types of vehicles.

Integral beam headlamp means a headlamp (other than a standardized sealed beam headlamp designed to conform to paragraph S10.13 or a replaceable bulb headlamp designed to conform to paragraph S10.15) comprising an integral and indivisible optical assembly including lens, reflector, and light source, except that a headlamp conforming to paragraph S10.18.8 or paragraph S10.18.9 may have a lens designed to be replaceable.

License plate lamp means a lamp used to illuminate the license plate on the rear of a vehicle.

Lower beam means a beam intended to illuminate the road and its environs ahead of the vehicle when meeting or closely following another vehicle.

Material means the type and grade of plastics, composition, and manufacturer's designation number and color.

Mechanically aimable headlamp means a headlamp having three pads on the lens, forming an aiming plane used for laboratory photometric testing and for adjusting and inspecting the aim of the headlamp when installed on the vehicle.

Motor driven cycle means every motorcycle, including every motor scooter, with a motor which produces not more than 5 horsepower, and every bicycle with motor attached.

Motorcycle or motor driven cycle headlamp means a major lighting device used to produce general illumination ahead of the vehicle.

Mounting ring means the adjustable ring upon which a sealed beam unit is mounted.

Mounting ring (type F sealed beam) means the adjustable ring upon which a sealed beam unit is mounted and which forces the sealed beam unit to seat against the aiming ring when assembled into a sealed beam assembly.

Multiple compartment lamp means a device which gives its indication by two or more separately lighted areas which are joined by one or more common parts, such as a housing or lens.

Multiple lamp arrangement means an array of two or more separate lamps on each side of the vehicle which operate together to give a signal.

Vehicle Maintenance Pro

Optically combined means a lamp having a single or two filament light source or two or more separate light sources that operate in different ways, and has its optically functional lens area wholly or partially common to two or more lamp functions.

Overall width means the nominal design dimension of the widest part of the vehicle, exclusive of signal lamps, marker lamps, outside rearview mirrors, flexible fender extensions, mud flaps, and outside door handles determined with doors and windows closed, and the wheels in the straight-ahead position. Running boards may also be excluded from the determination of overall width if they do not extend beyond the width as determined by the other items excluded by this definition.

Parking lamps are lamps on both the left and right of the vehicle which show to the front and are intended to mark the vehicle when parked or serve as a reserve front position indicating system in the event of headlamp failure.

Protected means material used in inner lenses for optical devices where such lenses are protected from exposure to the sun by an outer lens made of materials meeting the requirements for exposed plastics.

Rated voltage means the nominal circuit or vehicle electrical system voltage classification.

Reflex reflectors are devices used on vehicles to give an indication to approaching drivers using reflected light from the lamps of the approaching vehicle.

Remote reading indicator means a device that is not mounted in its entirety on a headlamp or headlamp aiming or headlamp mounting equipment, but otherwise meets the definition of a direct reading indicator.

Replaceable bulb headlamp means a headlamp comprising a bonded lens and reflector assembly and one or two replaceable light sources, except that a headlamp conforming to paragraph S10.18.8 or paragraph S10.18.9 may have a lens designed to be replaceable.

Replaceable light source means an assembly of a capsule, base, and terminals that is designed to conform to the requirements of Appendix A or Appendix B of 49 CFR part 564 *Replaceable Light Source Information* of this Chapter.

Retaining ring means the clamping ring that holds a sealed beam unit against a mounting ring.

Retaining ring (type F sealed beam) means the clamping ring that holds a sealed beam unit against a mounting ring, and that provides an interface between the unit's aiming/seating pads and the headlamp aimer adapter (locating plate).

School bus signal lamps are alternately flashing lamps mounted horizontally both front and rear, intended to identify a vehicle as a school bus and to inform other users of the highway that such vehicle is stopped on the highway to take on or discharge school children.

Sealed beam headlamp means an integral and indivisible optical assembly including the light source with "SEALED BEAM" molded in the lens.

Sealed beam headlamp assembly means a major lighting assembly which includes one or more sealed beam units used to provide general illumination ahead

of the vehicle.

Seasoning means the process of energizing the filament of a headlamp at design voltage for a period of time equal to 1% of design life, or other equivalent method.

Semiautomatic headlamp beam switching device is one which provides either automatic or manual control of beam switching at the option of the driver. When the control is automatic the headlamps switch from the upper beam to the lower beam when illuminated by the headlamps on an approaching vehicle and switch back to the upper beam when the road ahead is dark. When the control is manual, the driver may obtain either beam manually regardless of the conditions ahead of the vehicle.

Side marker lamps are lamps which show to the side of the vehicle, mounted on the permanent structure of the vehicle as near as practicable to the front and rear edges to indicate the overall length of the vehicle. Additional lamps may also be mounted at intermediate locations on the sides of the vehicle.

Stop lamps are lamps giving a steady light to the rear of a vehicle to indicate a vehicle is stopping or diminishing speed by braking.

Taillamps are steady burning low intensity lamps used to designate the rear of a vehicle.

Test voltage means the specified voltage and tolerance to be used when conducting a test.

Turn signal lamps are the signaling element of a turn signal system which indicates the intention to turn or change direction by giving a flashing light on the side toward which the turn will be made.

Turn signal flasher means a device which causes a turn signal lamp to flash as long as it is turned on.

Turn signal operating unit means an operating unit that is part of a turn signal system by which the operator of a vehicle causes the signal units to function.

Upper beam means a beam intended primarily for distance illumination and for use when not meeting or closely following other vehicles.

Vehicle headlamp aiming device or VHAD means motor vehicle equipment, installed either on a vehicle or headlamp, which is used for determining the horizontal or vertical aim, or both the vertical and horizontal aim of the headlamp.

Vehicular hazard warning signal flasher means a device which, as long as it is turned on, causes all the required turn signal lamps to flash.

Vehicular hazard warning signal operating unit means a driver controlled device which causes all required turn signal lamps to flash simultaneously to indicate to approaching drivers the presence of a vehicular hazard.

Visually/optically aimable headlamp means a headlamp which is designed to be visually/optically aimable in accordance with the requirements of paragraph S10.18.9 of this standard.

S5. References to SAE publications. Each required lamp, reflective device, and item of associated equipment

Regulations

must be designed to conform to the requirements of applicable SAE publications as referenced and subreferenced in this standard. The words “it is recommended that,” “recommendations,” or “should be” appearing in any SAE publication referenced or subreferenced in this standard must be read as setting forth mandatory requirements.

S5.1 Each required lamp, reflective device, and item of associated equipment must be designed to conform to the requirements of applicable SAE publications as referenced and subreferenced in this standard. The words “it is recommended that,” “recommendations,” or “should be” appearing in any SAE publication referenced or subreferenced in this standard must be read as setting forth mandatory requirements.

S5.2 *Incorporation by reference.* The Director of the Federal Register approves the incorporation by reference of the following material in accordance with 5 U.S.C. 552(a) and 1 CFR Part 51. All material is available for inspection at the NHTSA Reading Room, 1200 New Jersey Avenue, SE., Washington, DC 20590, or at NARA. For information on the availability of this material at NARA, call 202-741-6030, or go to: http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html.

The material is also available at the publisher whose name and address follow the standard number:

S6 Vehicle requirements.

S6.1 *Required lamps, reflective devices, and associated equipment by vehicle type.*

Vehicle Maintenance Pro

S6.1.1 Quantity. Except as provided in succeeding paragraphs of this S6.1.1 each vehicle must be equipped with at least the number of lamps, reflective devices, and items of associated equipment specified for that vehicle type and size in Table I and Section 6.6, designed to conform to the requirements of this standard. Multiple license plate lamps and backup lamps may be used to fulfill photometric requirements for those functions.

S6.1.1.1 Conspicuity systems. Each trailer of 2032 mm or more in overall width, and with a GVWR over 10,000 lbs., except a trailer designed exclusively for living or office use, and each truck tractor must be equipped with retroreflective sheeting, reflex reflectors, or a combination of retroreflective sheeting and reflex reflectors as specified in S8.2.

S6.1.1.2 High-mounted stop lamps. Each multipurpose passenger vehicle, truck, and bus required by this standard to be equipped with a high-mounted stop lamp, whose vertical centerline, when the vehicle is viewed from the rear, is not located on a fixed body panel but separates one or two moveable body sections, such as doors, which lacks sufficient space to install a single high-mounted stop lamp on the centerline above such body sections, must have two high-mounted stop lamps identical in size and shape.

S6.1.1.2.1 The two lamps must be located at the same height, with one vertical edge of each lamp on the vertical edge of the body section nearest the vehicle centerline.

S6.1.1.3 Truck tractor rear turn signal lamps. A truck tractor need not be equipped with turn signal lamps mounted on the rear if the turn signal lamps installed at or near the front are of double face construction and are located such that they meet the photometric requirements for double faced turn signal lamps specified in Footnote 6 of Table VII.

S6.1.1.3.1 The flashing signal from a double faced signal lamp must not be obliterated when subjected to external light rays from either in front or behind, at any and all angles.

S6.1.1.4 Daytime running lamps. Any pair of lamps on the front of a passenger car, multipurpose passenger vehicle, truck, or bus, whether or not required by this standard, other than parking lamps or fog lamps, may be wired to be automatically activated, as determined by the manufacturer of the vehicle, in a steady burning state as daytime running lamps (DRLs) in accordance with S7.10.5.

S6.1.2 Color. The color in all lamps and reflective devices to which this standard applies must be as specified in Table I. The color identified as amber is identical to the color identified as yellow.

S6.1.3 Mounting location.

S6.1.3.1 Each lamp, reflective device, and item of associated equipment must be securely mounted on a rigid part of the vehicle, other than glazing, that is not designed to be removed except for repair, within the mounting location and height limits as specified in Table I, and in a location where it complies with all applicable photometric requirements, effective pro-

jected luminous lens area requirements, and visibility requirements with all obstructions considered.

S6.1.3.2 When multiple lamp arrangements for rear turn signal lamps, stop lamps, or taillamps are used, with only a portion of the lamps installed on a fixed part of the vehicle, the lamp or lamps that are installed to the non-fixed part of the vehicle will be considered auxiliary lamps.

S6.1.3.3 License plate lamp. The license plate lamp or lamps installed on vehicles other than motorcycles and motor driven cycles must be mounted so as to illuminate the license plate without obstruction from any designed feature unless the lamp or lamps is (are) designed to comply with all the photometric requirements with these obstructions considered.

S6.1.3.4 High-mounted stop lamps.

S6.1.3.4.1 Interior mounting. A high-mounted stop lamp mounted inside the vehicle must have means provided to minimize reflections from the light of the lamp upon the rear window glazing that might be visible to the driver when viewed directly, or indirectly in the rearview mirror.

S6.1.3.4.2 Accessibility. Each high-mounted stop lamp must provide access for convenient replacement of bulbs without special tools.

S6.1.3.5 Headlamp beam mounting.

S6.1.3.5.1 Vertical headlamp arrangement.

S6.1.3.5.1.1 Where multiple headlamps with single light sources are installed in a vertical orientation the lower beam must be provided by the uppermost headlamp.

S6.1.3.5.1.2 Where headlamps with two vertically oriented light sources are installed the lower beam must be provided by the uppermost light source or by all light sources.

S6.1.3.5.2 Horizontal headlamp arrangement.

S6.1.3.5.2.1 Where multiple headlamps with single light sources are installed in a horizontal orientation the lower beam must be provided by the most outboard headlamp.

S6.1.3.5.2.2 Where headlamps with two horizontally oriented light sources are installed the lower beam must be provided by the outboard light source or by all light sources.

S6.1.3.6 Auxiliary lamps mounted near identification lamps. Each auxiliary lamp must be located at least twice the distance from any required identification lamp as the distance between two adjacent required identification lamps.

S6.1.4 Mounting height. The mounting height of each lamp and reflective device must be measured from the center of the item, as mounted on the vehicle at curb weight, to the road surface.

S6.1.4.1 High-mounted stop lamps.

S6.1.4.1.1 A high-mounted stop lamp mounted below the rear window must have no lens portion lower than 153 mm [6 in] below the lower edge of the rear glazing on convertibles, or 77 mm [3 in] on other passenger cars.

Regulations

S6.1.5 Activation. Each lamp must be activated as specified, in the combinations specified, and in response to the inputs specified in Table I and Table II.

S6.1.5.1 Hazard warning signal. In all passenger cars, multipurpose passenger vehicles, trucks, and buses, the activation of the vehicular hazard warning signal operating unit must cause to flash simultaneously sufficient turn signal lamps to meet, as a minimum, the turn signal photometric requirements of this standard.

S6.1.5.2 Simultaneous beam activation.

S6.1.5.2.1 On any vehicle to which this standard applies where the headlighting system is designed to conform to the photometric requirements of UB1 of Table XVIII and LB1M or LB1V of Table XIX-a, the lamps marked “L” or “LF” may remain permanently activated when the lamps marked “U” or “UF” are activated.

S6.1.5.2.2 On any vehicle to which this standard applies where an integral beam headlighting system is designed to conform to the photometric requirements of UB6 of Table XVIII and LB5M of Table XIX-b or LB4V of Table XIX-c, the lower beam headlamps must remain permanently activated when the upper beam headlamps are activated.

S6.1.5.2.3 On any vehicle to which this section applies where the headlighting system is designed to conform to the photometric requirements of UB2 of Table XVIII and LB2M or LB2V of Table XIX-a, a lower beam light source may remain permanently activated when an upper beam light source is activated if the lower beam light source contributes to the upper beam photometric compliance of the headlighting system.

S6.2 Impairment.

S6.2.1 No additional lamp, reflective device, or other motor vehicle equipment is permitted to be installed that impairs the effectiveness of lighting equipment required by this standard.

S6.2.2 If any required lamp or reflective device is obstructed by motor vehicle equipment (e.g., mirrors, snow plows, wrecker booms, backhoes, winches, etc.) including dealer installed equipment, and cannot meet the applicable photometry and visibility requirements, the vehicle must be equipped with an additional lamp or device of the same type which meet all applicable requirements of this standard, including photometry and visibility.

S6.2.3 Headlamp obstructions.

S6.2.3.1 When activated in the steady burning state, headlamps (excluding headlamps mounted on motorcycles) must not have any styling ornament or other feature, such as a translucent cover or grill, in front of the lens.

S6.2.3.2 Headlamp wipers may be used in front of the lens provided that the headlamp system is designed to conform with all applicable photometric requirements with the wiper stopped in any position in front of the lens.

S6.3 Equipment combinations. Two or more lamps, reflective devices, or items of associated equipment may be combined if the requirements for each lamp, reflec-

tive device, and item of associated equipment are met with the following exceptions:

S6.3.1 No high-mounted stop lamp is permitted to be combined with any other lamp or reflective device, other than with a cargo lamp.

S6.3.2 No high-mounted stop lamp is permitted to be optically combined with any cargo lamp.

S6.3.3 No clearance lamp is permitted to be optically combined with any taillamp.

S6.4 Lens area, visibility and school bus signal lamp aiming.

S6.4.1 Effective projected luminous lens area. Each turn signal lamp, stop lamp, high-mounted stop lamp, and school bus signal lamp must meet the applicable effective projected luminous lens area requirement specified in Tables IV-a, IV-b, and IV-c.

S6.4.2 Visibility. Each backup lamp, single or combination of dual high-mounted stop lamp(s), and school bus signal lamp must meet the applicable visibility requirement specified in Table V-a.

S6.4.3 Visibility options. A manufacturer must certify compliance of each lamp function to one of the following visibility requirement options, and it may not thereafter choose a different option for that vehicle:

(a) *Lens area option.* When a vehicle is equipped with any lamp listed in Table V-b each such lamp must provide not less than 1250 sq mm of unobstructed effective projected luminous lens area in any direction throughout the pattern defined by the corner points specified in Table V-b for each such lamp; or

(b) *Luminous intensity option.* When a vehicle is equipped with any lamp listed in Table V-c each such lamp must provide a luminous intensity of not less than that specified in Table V-c in any direction throughout the pattern defined by the corner points specified in Table V-c for each such lamp when measured in accordance with the photometry test requirements of this standard.

S6.4.4 Legacy visibility alternative. As an alternative to S6.4.3, each passenger car and motorcycle, and each multipurpose passenger vehicle, truck, trailer, and bus that is of less than 2032 mm overall width, that is manufactured on or before September 1, 2011, and each multipurpose passenger vehicle, truck, trailer, and bus that is of 2032 mm or more overall width, that is manufactured on or before September 1, 2014, must have each lamp located so that it meets the visibility requirements specified in Table V-d.

S6.4.5 School bus signal lamp aiming. Each school bus signal lamp must be mounted on the vehicle with its aiming plane vertical and normal to the vehicle longitudinal axis. Aim tolerance must be no more than 5 in vertically and 10 in horizontally at 25 ft from the lamp. If the lamps are aimed or inspected by use of SAE Recommended Practice J602-1963 (incorporated by reference, see §571.5), the graduation settings for aim must be 2° D and 0° sideways for aiming and the limits must be 3° U to 7° D and from 10° R to 10° L for inspection.

S6.5 Marking. A summary of the marking requirements of this standard and their location in the standard is contained in Table III.

Vehicle Maintenance Pro

S6.5.1 DOT marking. The lens of each original equipment and replacement headlamp, and of each original equipment and replacement beam contributor, and each replacement headlamp lens for an integral beam or replaceable bulb headlamp, must be marked with the symbol “DOT” either horizontally or vertically to indicate certification under 49 U.S.C. 30115.

S6.5.1.1 The DOT marking requirements for conspicuity materials are specified in S8.2 of this standard.

S6.5.1.2 Each original equipment or replacement lamp or reflective device specified in Table I, except for a headlamp, or an item of associated equipment specified in S9 may be marked with the symbol “DOT” which constitutes a certification that it conforms to the requirements of this standard.

S6.5.2 DRL marking. Each original equipment and replacement lamp used as a daytime running lamp (DRL), unless optically combined with a headlamp, must be permanently marked “DRL” on its lens in letters not less than 3 mm high.

S6.5.3 Headlamp markings.

S6.5.3.1 Trademark. The lens of each original and replacement equipment headlamp, and of each original and replacement equipment beam contributor must be marked with the name and/or trademark registered with the U.S. Patent and Trademark Office of the manufacturer of such headlamp or beam contributor, of its importer, or any manufacturer of a vehicle equipped with such headlamp or beam contributor. Nothing in this standard authorizes the marking of any such name and/or trademark by one who is not the owner, unless the owner has consented to it.

S6.5.3.2 Voltage and trade number. Each original and replacement equipment headlamp, and each original and replacement equipment beam contributor must be marked with its voltage and with its part or trade number.

S6.5.3.3 Sealed beam headlamp markings.

S6.5.3.3.1 Each sealed beam headlamp lens must be molded with “sealed beam” and the appropriate designation code as shown in Table II in characters no less than 6.35 mm in size.

S6.5.3.3.2 The face of any character molded on the surface of the lens must not be raised more than 0.5 mm above the lens surface.

S6.5.3.3.3 Type 1C1, 2C1, and 2D1 headlamps must have no raised markings on the outside surface of the lens between the diameters of 40 mm and 90 mm about the lens center.

S6.5.3.3.4 Type 1A1, 2A1, 2B1, and 2E1 headlamps must have no raised markings on the outside surface of the lens within a diameter of 70 mm about the lens center.

S6.5.3.3.5 Type LF, UF, 1G1, 2G1, and 2H1 headlamps must have no raised markings on the outside surface of the lens within a diameter of 35 mm about the lens center.

S6.5.3.3.6 A Type 1C1 replacement headlamp may be marked “1” rather than “1C1”. A Type 2C1 replacement headlamp may be marked “2” rather than “2C1”. A Type

2D1 replacement headlamp may be marked “TOP” or “2” rather than “2D1”.

S6.5.3.4 Replaceable bulb headlamp markings.

S6.5.3.4.1 The lens of each replaceable bulb headlamp must bear permanent marking in front of each replaceable light source with which it is equipped that states either: The HB Type, if the light source conforms to S11 of this standard for filament light sources, or the bulb marking/designation provided in compliance with Section VIII of Appendix A of 49 CFR Part 564 (if the light source conforms to S11 of this standard for discharge light sources).

S6.5.3.4.1.1 No marking need be provided if the only replaceable light source in the headlamp is type HB1.

S6.5.3.5 Additional headlamp markings. Additional marking requirements for headlamps are found in, S10.14.4, S10.15.4, S10.17.2, S10.18.5, S10.18.7, and S10.18.9 of this standard.

S6.5.3.6 Each replacement headlamp lens must also be marked with the manufacturer and the part or trade number of the headlamp for which it is intended, and with the name and/or trademark of the lens manufacturer or importer that is registered with the U.S. Patent and Trademark Office. Nothing in this standard authorizes the marking of any such name and/or trademark by one who is not the owner, unless the owner has consented to it.

S6.6 Associated equipment.

S6.6.1 All vehicles to which this standard applies, except trailers, must be equipped with a turn signal operating unit, a turn signal flasher, a turn signal pilot indicator, a headlamp beam switching device, and an upper beam headlamp indicator meeting the requirements of S9.

S6.6.2 All vehicles to which this standard applies except trailers and motorcycles must be equipped with a vehicular hazard warning operating unit, a vehicular hazard warning signal flasher, and a vehicular hazard warning signal pilot indicator meeting the requirements of S9.

S6.6.3 License plate holder. Each rear license plate holder must be designed and constructed to provide a substantial plane surface on which to mount the plate. The plane of the license plate mounting surface and the plane on which the vehicle stands must be perpendicular within $\pm 15^\circ$.

S6.7 Replacement equipment.

S6.7.1 General.

S6.7.1.1 Each replacement lamp, reflective device, or item of associated equipment, including a combination lamp, must:

(a) Be designed to conform to meet all requirements specified in this standard for that type of lamp, reflective device, or other item of equipment (in the case of a combination lamp, it must meet these requirements for each function); and

(b) Include all of the functions of the lamp, reflective device, or item of associated equipment, including a combination lamp, it is designed to replace or is capable

Regulations

of replacing (other than functions not required by this standard).

S6.7.1.2 Each replacement lamp, reflective device, or item of associated equipment, including a combination lamp, which is designed or recommended for particular vehicle models must be designed so that it does not take the vehicle out of compliance with this standard when the individual device is installed on the vehicle. Except as provided in S6.7.1.3, the determination of whether a vehicle would be taken out of compliance with this standard when an individual device is installed on the vehicle is made without regard to whether additional devices, including separate lamps or reflective devices sold together with the device, would also be installed.

S6.7.1.3 In the case of a lamp or other device that is used on each side of the vehicle in pairs, the determination (for the purposes of S6.7.1.2) of whether a vehicle would be taken out of compliance with this standard when an individual device is installed on the vehicle is made assuming that the other matched paired device would be installed on the other side of the vehicle, whether or not the matched paired devices are sold together. This provision does not limit the responsibilities of manufacturers, distributors, dealers or motor vehicle repair businesses under 49 U.S.C. 30122, *Making safety devices and elements inoperative*.

S6.7.2 *Version of this standard.* The requirements of S6.7.1 must be met, at the option of the manufacturer, using either the current version of this standard or the standard in effect at the time of manufacture of the original equipment being replaced.

S7. Signal lamp requirements.

S7.1 Turn signal lamps.

S7.1.1 Front turn signal lamps.

S7.1.1.1 *Number.* See Tables I-a and I-c.

S7.1.1.2 *Color of light.* See Tables I-a and I-c.

S7.1.1.3 *Mounting location.* See Tables I-a and I-c.

S7.1.1.4 *Mounting height.* See Tables I-a and I-c.

S7.1.1.5 *Activation.* See Tables I-a and I-c.

S7.1.1.6 *Effective projected luminous lens area.* See Table IV-a.

S7.1.1.7 *Visibility.* See S6.4.

S7.1.1.8 *Indicator.* See S9.3.

S7.1.1.9 *Markings.* See S6.5.1.2.

S7.1.1.10 *Spacing to other lamps.*

S7.1.1.10.1 Each front turn signal lamp must also be designed to comply with any additional photometry requirements based on its installed spacing to other lamps as specified by this section. Where more than one spacing relationship exists for a turn signal lamp the requirement must be the one that specifies the highest luminous intensity multiplier of Tables VI-a and VI-b.

S7.1.1.10.2 *Spacing measurement for non-reflector lamps.* For any front turn signal lamp that does not employ a reflector to meet photometric requirements, the spacing must be measured from the light source of the turn signal lamp to the lighted edge of any lower beam headlamp, or any lamp such as an auxiliary lower

beam headlamp or fog lamp used to supplement the lower beam headlamp.

S7.1.1.10.3 *Spacing measurement for lamps with reflectors.* For any front turn signal lamp which employs a reflector, such as a parabolic reflector, to meet photometric requirements, the spacing must be measured from the geometric centroid of the turn signal lamp effective projected luminous lens area to the lighted edge of any lower beam headlamp, or any lamp such as an auxiliary lower beam headlamp or fog lamp used to supplement the lower beam headlamp.

S7.1.1.10.4 *Spacing based photometric multipliers.*

(a) where the spacing measurement as measured from the optical center of the turn signal lamp, to the lighted edge of a lower beam headlamp is less than 100 mm the photometric multiplier must be 2.5.

(b) where the spacing measurement of S7.1.1.10.2 or S7.1.1.10.3 between a turn signal lamp and the lighted edge of any lamp such as an auxiliary lower beam headlamp or fog lamp used to supplement the lower beam headlamp is at least 75 mm but less than 100 mm the photometric multiplier of Table VI must be 1.5.

(c) where the spacing measurement of S7.1.1.10.2 or S7.1.1.10.3 between a turn signal lamp and the lighted edge of any lamp such as an auxiliary lower beam headlamp or fog lamp used to supplement the lower beam headlamp is at least 60 mm but less than 75 mm the photometric multiplier must be 2.0.

(d) where the spacing measurement of S7.1.1.10.2 or S7.1.1.10.3 between a turn signal lamp and the lighted edge of any lamp such as an auxiliary lower beam headlamp or fog lamp used to supplement the lower beam headlamp is less than 60 mm the photometric multiplier must be 2.5.

S7.1.1.11 *Multiple compartment lamps and multiple lamps.*

S7.1.1.11.1 A multiple compartment lamp or multiple lamps may be used to meet the photometric requirements of a front turn signal lamp provided the requirements of S6.1.3.2 are met.

S7.1.1.11.2 If a multiple compartment lamp or multiple lamps are used on a passenger car or on a multipurpose passenger vehicle, truck, bus, or trailer of less than 2032 mm in overall width, and the distance between adjacent light sources does not exceed 560 mm for two compartment or lamp arrangements and does not exceed 410 mm for three compartments or lamp arrangements, then the combination of the compartments or lamps must be used to meet the photometric requirements for the corresponding number of lighted sections specified in Tables VI-a or VI-b.

S7.1.1.11.3 If the distance between adjacent light sources exceeds the previously stated dimensions, each compartment or lamp must comply with the photometric requirements for one lighted section specified in Tables VI-a or VI-b.

S7.1.1.11.4 *Lamps installed on vehicles 2032 mm or more in overall width.* Multiple compartment front turn signal lamps installed on multipurpose passenger vehicles, trucks, and buses 2032 mm or more in overall

Vehicle Maintenance Pro

width require measurement of the photometrics for the entire lamp and not for individual compartments.

S7.1.1.12 Ratio to parking lamps and clearance lamps.

S7.1.1.12.1 When a parking lamp, or a clearance lamp on a multipurpose passenger vehicle, truck, trailer, or bus of 2032 mm or more in overall width, is combined with a front turn signal lamp, the luminous intensity of the front turn signal lamp at each identified test point must not be less than the luminous intensity of the parking lamp or clearance lamp at that same test point times the multiplier shown for that test point in Tables VI-a or VI-b.

S7.1.1.12.2 If a multiple compartment or multiple lamp arrangement is used on a passenger car or on a multipurpose passenger vehicle, truck, bus, or trailer of less than 2032 mm in overall width, and the distance between the optical axes for both the parking lamp and turn signal lamp is within 560 mm for two compartment or lamp arrangements or 410 mm for three compartment or lamp arrangements, then the ratio must be computed with all compartments or lamps lighted.

S7.1.1.12.3 If a multiple compartment or multiple lamp arrangement is used and the distance between optical axes for one of the functions exceeds 560 mm for two compartment or lamp arrangements or 410 mm for three compartments or lamp arrangements, then the ratio must be computed for only those compartments or lamps where the parking lamp and turn signal lamp are optically combined.

S7.1.1.12.4 Where the clearance lamp is combined with the turn signal lamp, and the maximum luminous intensity of the clearance lamp is located below horizontal and within an area generated by a 1.0 degree radius around a test point, the ratio for the test point may be computed using the lowest value of the clearance lamp luminous intensity within the generated area.

S7.1.1.13 Photometry.

S7.1.1.13.1 When tested according to the procedure of S14.2.1, each front turn signal lamp must be designed to conform to the base photometry requirements plus any applicable multipliers as shown in Tables VI-a and VI-b for the number of lamp compartments or individual lamps and the type of vehicle it is installed on.

S7.1.1.13.2 As an alternative to S7.1.1.13.1, a front turn signal lamp installed on a motorcycle may be designed to conform to the photometry requirements of Table XIII-a when tested according to the procedure of S14.2.1.

S7.1.1.14 Physical tests. Each front turn signal lamp must be designed to conform to the performance requirements of the vibration test, moisture test, dust test, and corrosion test of S14.5, and the color test and plastic optical material test of S14.4.

S7.1.2 Rear turn signal lamps.

S7.1.2.1 Number. See Tables I-a, I-b, and I-c.

S7.1.2.2 Color of light. See Tables I-a, I-b, and I-c.

S7.1.2.3 Mounting location. See Tables I-a, I-b, and I-c and S6.1.3.2.

S7.1.2.4 Mounting height. See Tables I-a, I-b, and I-c.

S7.1.2.5 Activation. See Tables I-a, I-b, and I-c.

S7.1.2.6 Effective projected luminous lens area. See Table IV-a.

S7.1.2.7 Visibility. See S6.4.

S7.1.2.8 Indicator. See S9.3.

S7.1.2.9 Markings. See S6.5.1.2.

S7.1.2.10 Spacing to other lamps. No requirement.

S7.1.2.11 Multiple compartments and multiple lamps.

S7.1.2.11.1 A multiple compartment lamp or multiple lamps may be used to meet the photometric requirements of a rear turn signal lamp provided the requirements of S6.1.3.2 are met

S7.1.2.11.2 If a multiple compartment lamp or multiple lamps are used on a passenger car or on a multipurpose passenger vehicle, truck, bus, or trailer of less than 2032 mm in overall width, and the distance between adjacent light sources does not exceed 560 mm for two compartment or lamp arrangements and does not exceed 410 mm for three compartment or lamp arrangements, then the combination of the compartments or lamps must be used to meet the photometric requirements for the corresponding number of lighted sections specified in Table VII.

S7.1.2.11.3 If the distance between adjacent light sources exceeds the previously stated dimensions, each compartment or lamp must comply with the photometric requirements for one lighted section specified in Table VII.

S7.1.2.11.4 Lamps installed on vehicles 2032 mm or more in overall width. Multiple compartment rear turn signal lamps installed on multipurpose passenger vehicles, trucks, and buses 2032 mm or more in overall width require measurement of the photometrics for the entire lamp and not for individual compartments.

S7.1.2.12 Ratio to taillamps and clearance lamps.

S7.1.2.12.1 When a taillamp, or a clearance lamp on a multipurpose passenger vehicle, truck, trailer, or bus of 2032 mm or more in overall width, is combined with a rear turn signal lamp, the luminous intensity of the rear turn signal lamp at each identified test point must not be less than the luminous intensity of the taillamp or clearance lamp at that same test point times the multiplier shown for that test point in Table VII.

S7.1.2.12.2 If a multiple compartment or multiple lamp arrangement is used on a passenger car or on a multipurpose passenger vehicle, truck, bus, or trailer of less than 2032 mm in overall width, and the distance between the optical axes for both the taillamp and turn signal lamp is within 560 mm for two compartment or lamp arrangement or 410 mm for three compartments or lamp arrangements, then the ratio must be computed with all compartments or lamps lighted.

S7.1.2.12.3 If a multiple compartment or multiple lamp arrangement is used and the distance between optical axes for one of the functions exceeds 560 mm for two compartment or lamp arrangements or 410 mm for three compartment or lamp arrangements, then the ratio must be computed for only those compartments or lamps where the taillamp and turn signal lamp are optically combined.

Regulations

S7.1.2.12.4 Where the taillamp or clearance lamp is combined with the turn signal lamp, and the maximum luminous intensity of the taillamp or clearance lamp is located below horizontal and within an area generated by a 0.5° radius around a test point for a taillamp on a passenger car or on a multipurpose passenger vehicle, truck, bus, or trailer of less than 2032 mm in overall width, or by a 1.0° radius around a test point for a taillamp or clearance lamp on a vehicle 2032 mm or more in overall width, the ratio for the test point may be computed using the lowest value of the taillamp or clearance lamp luminous intensity within the generated area.

S7.1.2.13 *Photometry.*

S7.1.2.13.1 Each rear turn signal lamp must be designed to conform to the photometry requirements of Table VII, when tested according to the procedure of S14.2.1, for the number of lamp compartments or individual lamps, the type of vehicle it is installed on, and the lamp color as specified by this section.

S7.1.2.13.2 As an alternative to S7.1.2.13.1, a rear turn signal lamp installed on a motorcycle may be designed to conform to the photometry requirements of Table XIII-a when tested according to the procedure of S14.2.1.

S7.1.2.14 *Physical tests.* Each rear turn signal lamp must be designed to conform to the performance requirements of the vibration test, moisture test, dust test, and corrosion test of S14.5, and the color test and plastic optical material test of S14.4.

S7.1.3 *Combined lamp bulb indexing.*

S7.1.3.1 Each turn signal lamp optically combined with a taillamp or a parking lamp, or clearance lamp where installed on a vehicle 2032 mm or more in overall width, where a two-filament bulb is used must have a bulb with an indexing base and a socket designed so that bulbs with non-indexing bases cannot be used.

S7.1.3.2 Removable sockets must have an indexing feature so that they cannot be re-inserted into lamp housings in random positions, unless the lamp will perform its intended function with random light source orientation.

S7.2 *Taillamps.*

S7.2.1 *Number.* See Tables I-a, I-b, and I-c.

S7.2.2 *Color of light.* See Tables I-a, I-b, and I-c.

S7.2.3 *Mounting location.* See Tables I-a, I-b, and I-c and S6.1.3.2.

S7.2.4 *Mounting height.* See Tables I-a, I-b, and I-c.

S7.2.5 *Activation.* See Tables I-a, I-b, and I-c.

S7.2.6 *Effective projected luminous lens area.* No requirement.

S7.2.7 *Visibility.* See S6.4.

S7.2.8 *Indicator.* No requirement.

S7.2.9 *Markings.* See S6.5.1.2.

S7.2.10 *Spacing to other lamps.* No requirement.

S7.2.11 *Multiple compartments and multiple lamps.*

S7.2.11.1 A multiple compartment lamp or multiple lamps may be used to meet the photometric require-

ments of a taillamp provided the requirements of S6.1.3.2 are met.

S7.2.11.2 If a multiple compartment lamp or multiple lamps are used and the distance between the optical axes does not exceed 560 mm for two compartment or lamp arrangements and does not exceed 410 mm for three compartment or lamp arrangements, then the combination of the compartments or lamps must be used to meet the photometric requirements for the corresponding number of lighted sections specified in Table VIII.

S7.2.11.3 If the distance between optical axes exceeds the previously stated dimensions, each compartment or lamp must comply with the photometric requirements for one lighted section specified in Table VIII.

S7.2.11.4 *Taillamps installed on vehicles 2032 mm or more in overall width.* A maximum of two taillamps and/or two compartments per side may be mounted closer together than 560 mm providing that each compartment and/or lamp meets the single lighted section photometric requirements specified in Table VIII. Each lamp and/or compartment utilized in this manner must meet the single lighted section requirements for all functions for which it is designed.

S7.2.12 *Ratio.* See S7.1.2.12 for rear turn signal lamps and S7.3.12 for stop lamps.

S7.2.13 *Photometry.* Each taillamp must be designed to conform to the photometry requirements of Table VIII, when tested according to the procedure of S14.2.1, for the number of lamp compartments or individual lamps and the type of vehicle it is installed on.

S7.2.14 *Physical tests.* Each taillamp must be designed to conform to the performance requirements of the vibration test, moisture test, dust test, and corrosion test of S14.5, and the color test and plastic optical material test of S14.4.

S7.3 *Stop lamps.*

S7.3.1 *Number.* See Tables I-a, I-b, and I-c.

S7.3.2 *Color of light.* See Tables I-a, I-b, and I-c.

S7.3.3 *Mounting location.* See Tables I-a, I-b, and I-c and S6.1.3.2.

S7.3.4 *Mounting height.* See Tables I-a, I-b, and I-c.

S7.3.5 *Activation.* See Tables I-a, I-b, and I-c.

S7.3.6 *Effective projected luminous lens area.* See Table IV-a.

S7.3.7 *Visibility.* See S6.4.

S7.3.8 *Indicator.* No requirement.

S7.3.9 *Markings.* See S6.5.1.2.

S7.3.10 *Spacing to other lamps.* No requirement.

S7.3.11 *Multiple compartments and multiple lamps.*

S7.3.11.1 A multiple compartment lamp or multiple lamps may be used to meet the photometric requirements of a stop lamp provided the requirements of S6.1.3.2 are met.

S7.3.11.2 If a multiple compartment lamp or multiple lamps are used on a passenger car or on a multipurpose passenger vehicle, truck, bus, or trailer of less than 2032 mm in overall width, and the distance between adjacent light sources does not exceed 560 mm for two

Vehicle Maintenance Pro

compartment or lamp arrangements and does not exceed 410 mm for three compartment or lamp arrangements, then the combination of the compartments or lamps must be used to meet the photometric requirements for the corresponding number of lighted sections specified in Table IX.

S7.3.11.3 If the distance between adjacent light sources exceeds the previously stated dimensions, each compartment or lamp must comply with the photometric requirements for one lighted section specified in Table IX.

S7.3.11.4 *Lamps installed on vehicles 2032 mm or more in overall width.* Multiple compartment stop lamps installed on multipurpose passenger vehicles, trucks, and buses 2032 mm or more in overall width require measurement of the photometrics for the entire lamp and not for individual compartments.

S7.3.12 *Ratio to taillamps.*

S7.3.12.1 When a taillamp is combined with a stop lamp, the luminous intensity of the stop lamp at each identified test point must not be less than the luminous intensity of the taillamp at that same test point times the multiplier shown for that test point in Table IX.

S7.3.12.2 If a multiple compartment or multiple lamp arrangement is used on a passenger car or on a multipurpose passenger vehicle, truck, bus, or trailer of less than 2032 mm in overall width, and the distance between the optical axes for both the taillamp and stop lamp is within 560 mm for two compartment or lamp arrangements or 410 mm for three compartment or lamp arrangements, then the ratio must be computed with all compartments or lamps lighted.

S7.3.12.3 If a multiple compartment or multiple lamp arrangement is used and the distance between optical axes for one of the functions exceeds 560 mm for two compartment or lamp arrangements or 410 mm for three compartments or lamp arrangements, then the ratio must be computed for only those compartments or lamps where the taillamp and stop lamp are optically combined.

S7.3.12.4 Where the taillamp is combined with the stop lamp, and the maximum luminous intensity of the taillamp is located below horizontal and within an area generated by a 0.5° radius around a test point for a taillamp on a passenger car or on a multipurpose passenger vehicle, truck, bus, or trailer of less than 2032 mm in overall width, or by a 1.0° radius around a test point for a taillamp on a vehicle 2032 mm or more in overall width, the ratio for the test point may be computed using the lowest value of the taillamp luminous intensity within the generated area.

S7.3.13 *Photometry.*

S7.3.13.1 Each stop lamp must be designed to conform to the photometry requirements of Table IX, when tested according to the procedure of S14.2.1, for the number of lamp compartments or individual lamps and the type of vehicle it is installed on.

S7.3.13.2 A stop lamp installed on a motor driven cycle may be designed to conform to the photometry requirements of Table XIII-b when tested according to the procedure of S14.2.1.

S7.3.14 *Physical tests.* Each stop lamp must be designed to conform to the performance requirements of the vibration test, moisture test, dust test, and corrosion test of S14.5, and the color test and plastic optical material test of S14.4.

S7.3.15 *Combined lamp bulb indexing.*

S7.3.15.1 Each stop lamp optically combined with a taillamp where a two-filament bulb is used must have a bulb with an indexing base and a socket designed so that bulbs with non-indexing bases cannot be used.

S7.3.15.2 Removable sockets must have an indexing feature so that they cannot be re-inserted into lamp housings in random positions, unless the lamp will perform its intended function with random light source orientation.

S7.4 *Side marker lamps.*

S7.4.1 *Number.* See Tables I-a, I-b, and I-c.

S7.4.2 *Color of light.* See Tables I-a, I-b, and I-c.

S7.4.3 *Mounting location.* See Tables I-a, I-b, and I-c.

S7.4.4 *Mounting height.* See Tables I-a, I-b, and I-c.

S7.4.5 *Activation.* See Tables I-a, I-b, and I-c.

S7.4.6 *Effective projected luminous lens area.* No requirement.

S7.4.7 *Visibility.* No requirement.

S7.4.8 *Indicator.* No requirement.

S7.4.9 *Markings.* See S6.5.1.2.

S7.4.10 *Spacing to other lamps.* No requirement.

S7.4.11 *Multiple compartments and multiple lamps.* No requirement.

S7.4.12 *Ratio.* No requirement.

S7.4.13 *Photometry.*

S7.4.13.1 Each side marker lamp must be designed to conform to the photometry requirements of Table X, when tested according to the procedure of S14.2.1, for the lamp color as specified by this section.

S7.4.13.2 *Inboard photometry.* For each motor vehicle less than 30 feet in overall length and less than 2032 mm in overall width, the minimum photometric intensity requirements for a side marker lamp may be met for all inboard test points at a distance of 15 feet from the vehicle and on a vertical plane that is perpendicular to the longitudinal axis of the vehicle and located midway between the front and rear side marker lamps.

S7.4.14 *Physical tests.* Each side marker lamp must be designed to conform to the performance requirements of the vibration test, moisture test, dust test, and corrosion test of S14.5, and the color test and plastic optical material test of S14.4.

S7.5 *Clearance and identification lamps.*

S7.5.1 *Number.* See Tables I-a and I-b.

S7.5.2 *Color of light.* See Tables I-a and I-b.

S7.5.3 *Mounting location.* See Tables I-a and I-b.

S7.5.4 *Mounting height.* See Tables I-a and I-b.

S7.5.5 *Activation.* See Tables I-a and I-b.

S7.5.6 *Effective projected luminous lens area.* No requirement.

S7.5.7 *Visibility.* No requirement.

Regulations

S7.5.8 *Indicator*. No requirement.

S7.5.9 *Markings*. See S6.5.1.2.

S7.5.10 *Spacing to other lamps*. No requirement.

S7.5.11 *Multiple compartments and multiple lamps*. No requirement.

S7.5.12 *Ratio*.

S7.5.12.1 *Clearance lamps*. See S7.1.1.12 for front turn signal lamps and S7.1.2.12 for rear turn signal lamps.

S7.5.12.2 *Identification lamps*. No requirement.

S7.5.13 *Photometry*. Each clearance or identification lamp must be designed to conform to the photometry requirements of Table XI, for the applicable lamp color, when tested according to the procedure of S14.2.1.

S7.5.14 *Physical tests*. Each clearance and identification must be designed to conform to the performance requirements of the vibration test, moisture test, dust test, and corrosion test of S14.5, and the color test and plastic optical material test of S14.4.

S7.6 *Backup lamps*.

S7.6.1 *Number*. See Table I-a and S6.1.1.

S7.6.2 *Color of light*.

S7.6.2.1 See Table I-a.

S7.6.2.2 A backup lamp may project incidental red, yellow, or white light through reflectors or lenses that are adjacent, close to, or a part of the lamp assembly.

S7.6.3 *Mounting location*. See Table I-a.

S7.6.4 *Mounting height*. No requirement.

S7.6.5 *Activation*. See Table I-a.

S7.6.6 *Effective projected luminous lens area*. No requirement.

S7.6.7 *Visibility*. See Table V-a.

S7.6.8 *Indicator*. No requirement.

S7.6.9 *Markings*. See S6.5.1.2.

S7.6.10 *Spacing to other lamps*. No requirement.

S7.6.11 *Multiple compartments and multiple lamps*. No requirement.

S7.6.12 *Ratio*. No requirement.

S7.6.13 *Photometry*. Each backup lamp must be designed to conform to the photometry requirements of Table XII, when tested according to the procedure of S14.2.1, as specified by this section.

S7.6.14 *Physical tests*. Each backup lamp must be designed to conform to the performance requirements of the vibration test, moisture test, dust test, and corrosion test of S14.5, and the color test and plastic optical material test of S14.4.

S7.7 *License plate lamps*.

S7.7.1 *Number*. See Tables I-a, I-b, and I-c and S6.1.1.

S7.7.2 *Color of light*. See Tables I-a, I-b, and I-c.

S7.7.3 *Mounting location*. See Tables I-a, I-b, and I-c.

S7.7.4 *Mounting height*. No requirement.

S7.7.5 *Activation*. See Tables I-a, I-b, and I-c.

S7.7.6 *Effective projected luminous lens area*. No requirement.

S7.7.7 *Visibility*. No requirement.

S7.7.8 *Indicator*. No requirement.

S7.7.9 *Markings*. See S6.5.1.2.

S7.7.10 *Spacing to other lamps*. No requirement.

S7.7.11 *Multiple compartments and multiple lamps*. No requirement.

S7.7.12 *Ratio*. No requirement.

S7.7.13 *Photometry*.

S7.7.13.1 Each license plate lamp must be designed to conform to the photometry requirements of this section when tested according to the procedure of S14.2.2.

S7.7.13.2 An illumination value of no less than 8 lx [0.75 fc] must be met at each test station target location shown in Figure 19.

S7.7.13.3 The ratio of the average of the two highest illumination values divided by the average of the two lowest illumination values must not exceed 20:1 for vehicles other than motorcycles and motor driven cycles.

S7.7.13.4 The ratio of the highest illumination value divided by the average of the two lowest illumination values must not exceed 15:1 for motorcycles and motor driven cycles.

S7.7.14 *Physical tests*. Each license plate lamp must be designed to conform to the performance requirements of the vibration test, moisture test, dust test, and corrosion test of S14.5, and the color test and plastic optical material test of S14.4.

S7.7.15 *Installation*.

S7.7.15.1 Each license plate lamp installed on a vehicle other than a motorcycle or motor driven cycle must be of such size and design as to provide illumination on all parts of a 150 mm by 300 mm test plate.

S7.7.15.2 Each license plate lamp installed on a motorcycle or motor driven cycle must be of such size and design as to provide illumination on all parts of a 100 mm by 175 mm test plate.

S7.7.15.3 The light rays must reach all portions of an imaginary plate of the same size at least 25 mm ahead of the actual plate measured perpendicular to the plane of the plate.

S7.7.15.4 *Incident light from single lamp*. When a single lamp as shown in Figure 20 is used to illuminate the license plate, the lamp and license plate holder must bear such relation to each other that at no point on the plate must the incident light make an angle of less than 8° to the plane of the plate, this angle being measured from the edge of the light emitting surface of the lamp farthest from the surface of the plate.

S7.7.15.5 *Incident light from multiple lamps*. When two or more lamps as shown in Figure 20 are used to illuminate the license plate, the minimum 8° incident light angle must apply only to that portion of the plate which the particular lamp is designed to illuminate. The angle must be measured in the same manner as S7.7.15.4.

S7.8 *Parking lamps*.

S7.8.1 *Number*. See Table I-a.

S7.8.2 *Color of light*. See Table I-a.

S7.8.3 *Mounting location*. See Table I-a.

S7.8.4 *Mounting height*. See Table I-a.

Vehicle Maintenance Pro

S7.8.5 *Activation*. See Table I-a.

S7.8.6 *Effective projected luminous lens area*. No requirement.

S7.8.7 *Visibility*. See S6.4.

S7.8.8 *Indicator*. No requirement.

S7.8.9 *Markings*. See S6.5.1.2.

S7.8.10 *Spacing to other lamps*. No requirement.

S7.8.11 *Multiple compartments and multiple lamps*. No requirement.

S7.8.12 *Ratio*. See S7.1.1.12 for front turn signal lamps.

S7.8.13 *Photometry*. Each parking lamp must be designed to conform to the photometry requirements of Table XIV, when tested according to the procedure of S14.2.1, as specified by this section.

S7.8.14 *Physical tests*. Each parking lamp must be designed to conform to the performance requirements of the vibration test, moisture test, dust test, and corrosion test of S14.5, and the color test and plastic optical material test of S14.4.

S7.9 *High-mounted stop lamps*.

S7.9.1 *Number*. See Table I-a and S6.1.1.2.

S7.9.2 *Color of light*. See Table I-a.

S7.9.3 *Mounting location*. See Table I-a.

S7.9.4 *Mounting height*. See Table I-a and S6.1.4.1.

S7.9.5 *Activation*. See Table I-a.

S7.9.6 *Effective projected luminous lens area*. See Table IV-b.

S7.9.7 *Visibility*. See Table V-a.

S7.9.8 *Indicator*. No requirement.

S7.9.9 *Markings*. See S6.5.1.2.

S7.9.10 *Spacing to other lamps*. No requirement.

S7.9.11 *Multiple compartments and multiple lamps*. No requirement.

S7.9.12 *Ratio*. No requirement.

S7.9.13 *Photometry*. Each high-mounted stop lamp must be designed to conform to the photometry requirements of Table XV, when tested according to the procedure of S14.2.1, as specified by this section.

S7.9.14 *Physical tests*.

S7.9.14.1 Each high-mounted stop lamp must be designed to conform to the performance requirements of the vibration test of S14.5, and the color test and plastic optical material test of S14.4.

S7.9.14.2 Each high-mounted stop lamp that is not mounted inside the vehicle must be designed to conform to the performance requirements of the moisture test, dust test, and corrosion test of S14.5.

S7.10 *Daytime running lamps (DRLs)*.

S7.10.1 *Number*. See Table I-a.

S7.10.2 *Color of light*. See Table I-a.

S7.10.3 *Mounting location*. See Table I-a.

S7.10.4 *Mounting height*. See Table I-a. and S7.10.13(b).

S7.10.5 *Activation*. See Table I-a. and S7.10.10.1(c).

S7.10.6 *Effective projected luminous lens area*. No requirement.

S7.10.7 *Visibility*. No requirement.

S7.10.8 *Indicator*. No requirement.

S7.10.9 *Markings*. See S6.5.

S7.10.10 *Spacing to other lamps*.

S7.10.10.1 *Spacing to turn signal lamps*. Each DRL not optically combined with a turn signal lamp must be located on the vehicle so that the distance from its lighted edge to the optical center of the nearest turn signal lamp is not less than 100 mm unless,

(a) The luminous intensity of the DRL is not more than 2,600 cd at any location in the beam and the turn signal lamp meets 2.5 times the base front turn signal photometric requirements, or

(b) The DRL is optically combined with a lower beam headlamp and the turn signal lamp meets 2.5 times the base front turn signal photometric requirements, or

(c) The DRL is deactivated when the turn signal or hazard warning signal lamp is activated.

S7.10.11 *Multiple compartments and multiple lamps*. No requirement.

S7.10.12 *Ratio*. No requirement.

S7.10.13 *Photometry*. Each DRL must have a luminous intensity not less than 500 cd at test point H-V, nor more than 3,000 cd at any location in the beam when tested according to the procedure of S14.2.4 as specified by this section, unless it is:

(a) A lower beam headlamp intended to operate as a DRL at full voltage, or a voltage lower than used to operate it as a lower beam headlamp, or

(b) An upper beam headlamp intended to operate as a DRL, whose luminous intensity at test point H-V is not more than 7,000 cd, and whose mounting height is not higher than 864 mm.

S7.10.14 *Physical tests*. Each DRL that is not combined with another required lamp must be designed to conform to the performance requirements of the color test and plastic optical material test of S14.4.

S7.11 *School bus signal lamps*.

S7.11.1 *Number*. See Table I-a.

S7.11.2 *Color of light*. See Table I-a.

S7.11.3 *Mounting location*. See Table I-a.

S7.11.4 *Mounting height*. See Table I-a.

S7.11.5 *Activation*. See Table I-a.

S7.11.6 *Effective projected luminous lens area*. See Table IV-c.

S7.11.7 *Visibility*. See Table V-a.

S7.11.8 *Indicator*. No requirement.

S7.11.9 *Markings*. See S6.5.1.2.

S7.11.10 *Spacing to other lamps*. No requirement.

S7.11.11 *Multiple compartments and multiple lamps*. No requirement.

S7.11.12 *Ratio*. No requirement.

Regulations

S7.11.13 Photometry. Each school bus signal lamp must be designed to conform to the photometry requirements of Table XVII, when tested according to the procedure of S14.2.1, for the lamp color as specified by this section.

S7.11.14 Physical tests. Each school bus signal lamp must be designed to conform to the performance requirements of the vibration test, moisture test, dust test, and corrosion test of S14.5, and the color test and plastic optical material test of S14.4.

S8 Reflective device requirements.

S8.1 Reflex reflectors.

S8.1.1 Number. See Tables I-a, I-b, and I-c.

S8.1.2 Color. See Tables I-a, I-b, and I-c.

S8.1.3 Mounting location. See Tables I-a, I-b, and I-c.

S8.1.4 Mounting height. See Tables I-a, I-b, and I-c.

S8.1.5 Activation. No requirement.

S8.1.6 Effective projected luminous lens area. No requirement.

S8.1.7 Visibility. No requirement.

S8.1.8 Indicator. No requirement.

S8.1.9 Markings. See S6.5.1.2.

S8.1.10 Spacing to other lamps or reflective devices. No requirement.

S8.1.11 Photometry. Each reflex reflector must be designed to conform to the photometry requirements of Table XVI-a when tested according to the procedure of S14.2.3 for the reflex reflector color as specified by this section.

S8.1.12 Physical tests. Each reflex reflector must be designed to conform to the performance requirements of the vibration test, moisture test, dust test, and corrosion test of S14.5, and the color test and plastic optical material test of S14.4.

S8.1.13 Alternative side reflex reflector material. Reflective material conforming to GSA Federal Specification L-S-300 (incorporated by reference, see §571.5), may be used for side reflex reflectors if this material as used on the vehicle, meets the performance requirements of Table XVI-a.

S8.2 Conspicuity systems. The requirement for conspicuity systems may be met with retroreflective sheeting, conspicuity reflex reflectors, or a combination of retroreflective sheeting and conspicuity reflex reflectors.

S8.2.1 Retroreflective sheeting.

S8.2.1.1 Retroreflective sheeting must consist of a smooth, flat, transparent exterior film with retroreflective elements embedded or suspended beneath the film so as to form a non-exposed retroreflective optical system.

S8.2.1.2 Retroreflective sheeting material. Retroreflective sheeting must meet the requirements, except photometry, of ASTM D 4956-90 (incorporated by reference, see §571.5) for Type V Sheeting. Sheeting of Grade DOT-C2 of no less than 50 mm wide, Grade DOT-C3 of no less than 75 mm wide, or Grade DOT-C4 of no less than 100 mm wide may be used.

S8.2.1.3 Certification marking. The letters DOT-C2, DOT-C3, or DOT-C4, as appropriate, constituting a certification that the retroreflective sheeting conforms to the requirements of this standard, must appear at least once on the exposed surface of each white or red segment of retroreflective sheeting, and at least once every 300 mm on retroreflective sheeting that is white only. The characters must be not less than 3 mm high, and must be permanently stamped, etched, molded, or printed in indelible ink.

S8.2.1.4 Application pattern.

S8.2.1.4.1 Alternating red and white materials.

S8.2.1.4.1.1 As shown in Figures 12-1 and 12-2, where alternating material is installed, except for a segment that is trimmed to clear obstructions, or lengthened to provide red sheeting near red lamps, alternating material must be installed with each white and red segment having a length of 300 ± 150 mm.

S8.2.1.4.1.2 Neither white nor red sheeting must represent more than two thirds the aggregate of any continuous strip marking the width of a trailer, or any continuous or broken strip marking its length.

S8.2.1.5 Application location. Conspicuity systems need not be installed, as illustrated in Figure 12-2, on discontinuous surfaces such as outside ribs, stake post pickets on platform trailers, and external protruding beams, or to items of equipment such as door hinges and lamp bodies on trailers and body joints, stiffening beads, drip rails, and rolled surfaces on truck tractors.

S8.2.1.6 Application spacing. As illustrated in Figure 12-2, the edge of any white sheeting must not be located closer than 75 mm to the edge of the luminous lens area of any red or amber lamp that is required by this standard. The edge of any red sheeting must not be located closer than 75 mm to the edge of the luminous lens area of any amber lamp that is required by this standard.

S8.2.1.7 Photometry. Each retroreflective sheeting must be designed to conform to the photometry requirements of Table XVI-c when tested according to the procedure of S14.2.3 for the color and grade as specified by this section.

S8.2.2 Conspicuity reflex reflectors.

S8.2.2.1 Certification marking. The exposed surface of each conspicuity reflex reflector must be marked with the letters DOT-C which constitutes a certification that the reflector conforms to the conspicuity reflex reflector requirements of this standard. The certification must be not less than 3 mm high, and must be permanently stamped, etched, molded, or printed in indelible ink.

S8.2.2.2 Application pattern.

S8.2.2.2.1 Alternating red and white materials. Conspicuity reflex reflectors must be installed in a repetitive pattern of two or three white reflectors alternating with two or three red reflectors, with the center of each reflector not more than 100 mm from the center of each adjacent reflector.

S8.2.2.2.2 White material. White conspicuity reflex reflectors must be installed with the center of each reflector not more than 100 mm from the center of each adjacent reflector.

Vehicle Maintenance Pro

S8.2.2.3 *Photometry.*

S8.2.2.3.1 Each red conspicuity reflex reflector must be designed to conform to the photometry requirements of Table XVI-a for a red reflex reflector and Table XVI-b for a red conspicuity reflex reflector when tested according to the procedure of S14.2.3 as specified by this section.

S8.2.2.3.2 Each white conspicuity reflex reflector installed in only a horizontal orientation must be designed to conform to the photometry requirements of Table XVI-a for a white reflex reflector and Table XVI-b for a white horizontal conspicuity reflex reflector when tested according to the procedure of S14.2.3 as specified by this section.

S8.2.2.3.3 Each white conspicuity reflex reflector installed in a vertical orientation must be designed to conform to the photometry requirements of Table XVI-a for a white reflex reflector, and Table XVI-b for a white horizontal conspicuity reflex reflector and a white vertical conspicuity reflex reflector when tested according to the procedure of S14.2.3 as specified by this section.

S8.2.3 *Conspicuity system installation on trailers.*

S8.2.3.1 *Trailer rear.*

S8.2.3.1.1 *Element 1-alternating red and white materials.* As shown in Figure 11, a strip of sheeting or conspicuity reflex reflectors, as horizontal as practicable, must be applied across the full width of the trailer, as close to the extreme edges as practicable, and as close as practicable to not less than 375 mm and not more than 1525 mm above the road surface at the strip centerline with the trailer at curb weight.

S8.2.3.1.2 *Element 2-white.* (not required for container chassis or for platform trailers without bulkheads).

S8.2.3.1.2.1 As shown in Figure 11, two pairs of strips of sheeting or conspicuity reflex reflectors, each pair consisting of strips 300 mm long of Grade DOT-C2, DOT-C3, or DOT-C4, must be applied horizontally and vertically to the right and left upper contours of the body, as viewed from the rear, as close to the top of the trailer and as far apart as practicable.

S8.2.3.1.2.2 If the perimeter of the body, as viewed from the rear, is other than rectangular, the strips may be applied along the perimeter, as close as practicable to the uppermost and outermost areas of the rear of the body on the left and right sides.

S8.2.3.1.3 *Element 3-alternating red and white materials.* (not required for trailers without underride protection devices).

S8.2.3.1.3.1 As shown in Figure 11, a strip of Grade DOT-C2 sheeting no less than 38 mm wide or reflectors must be applied across the full width of the horizontal member of the rear underride protection device.

S8.2.3.2 *Trailer side-alternating red and white materials.*

S8.2.3.2.1 As shown in Figure 11, a strip of sheeting or conspicuity reflex reflectors must be applied to each side, as horizontal as practicable, originating and terminating as close to the front and rear as practicable, as close as practicable to not less than 375 mm and not

more than 1525 mm above the road surface at the strip centerline at curb weight, except that at the location chosen the strip must not be obscured in whole or in part by other motor vehicle equipment or trailer cargo.

S8.2.3.2.2 The strip need not be continuous as long as not less than half the length of the trailer is covered and the spaces are distributed as evenly as practicable.

S8.2.3.2.3 If necessary to clear rivet heads or other similar obstructions, Grade DOT-C2 sheeting may be separated into two 25 mm wide strips of the same length and color, separated by a space of not more than 25 mm and used in place of the retroreflective sheeting that would otherwise be applied.

S8.2.4 *Conspicuity system installation on truck tractors.*

S8.2.4.1 *Element 1-alternating red and white materials.* As shown in Figure 13, two strips of sheeting or conspicuity reflex reflectors, each not less than 600 mm long, located as close as practicable to the edges of the rear fenders, mudflaps, or the mudflap support brackets, must be applied to mark the width of the truck tractor.

S8.2.4.1.1 The strips must be mounted as horizontal as practicable, in a vertical plane facing the rear, on the rear fenders, on the mudflap support brackets, on plates attached to the mudflap support brackets, or on the mudflaps.

S8.2.4.1.2 Strips on mudflaps must be mounted not lower than 300 mm below the upper horizontal edge of the mudflap. If the vehicle is certified with temporary mudflap support brackets, the strips must be mounted on the mudflaps or on plates transferable to permanent mudflap support brackets.

S8.2.4.1.3 For a truck tractor without mudflaps, the strips may be mounted outboard of the frame on brackets behind the rear axle or on brackets ahead of the rear axle and above the top of the rear tires at unladen vehicle height, or they may be mounted directly or indirectly to the back of the cab as close to the outer edges as practicable, above the top of the tires, and not more than 1525 mm above the road surface at unladen vehicle height.

S8.2.4.1.4 If the strips are mounted on the back of the cab, no more than 25% of their cumulative area may be obscured by vehicle equipment as determined in a rear orthogonal view.

S8.2.4.2 *Element 2-white.* As shown in Figure 13, two pairs of strips of sheeting or conspicuity reflex reflectors, each pair consisting of strips 300 mm long, must be applied horizontally and vertically as practicable to the right and left upper contours of the cab, as close to the top of the cab and as far apart as practicable.

S8.2.4.2.1 No more than 25% of their cumulative area may be obscured by vehicle equipment as determined in a rear orthogonal view.

S8.2.4.2.2 If one pair must be relocated to avoid obscuration by vehicle equipment, the other pair may be relocated in order to be mounted symmetrically.

S8.2.4.2.3 If the rear window is so large as to occupy all the practicable space, the material may be attached to the edge of the window itself.

Regulations

S9 Associated equipment requirements.

S9.1 Turn signal operating unit.

S9.1.1 The turn signal operating unit installed on passenger cars, multipurpose passenger vehicles, trucks, and buses less than 2032 mm in overall width must be self-canceling by steering wheel rotation and capable of cancellation by a manually operated control.

S9.1.2 *Physical tests.* Each turn signal operating unit must be designed to conform to all applicable performance requirements of S14.9.

S9.2 Turn signal flasher.

S9.2.1 The means of producing the turn signal pilot indicator signal may be incorporated in the flasher. A means of producing an audible signal may be incorporated in the flasher.

S9.2.2 *Physical tests.* Each turn signal flasher must be designed to conform to all applicable performance requirements of S14.9.

S9.3 Turn signal pilot indicator.

S9.3.1 Each vehicle equipped with a turn signal operating unit where any turn signal lamp is not visible to the driver must also have an illuminated pilot indicator to provide a clear and unmistakable indication that the turn signal system is activated.

S9.3.2 The indicator must consist of one or more lights flashing at the same frequency as the turn signal lamps.

S9.3.3 The indicator must function satisfactorily under all test conditions imposed on the turn signal flasher in S14.9.

S9.3.4 Indicator size and color.

S9.3.4.1 If the indicator is located inside the vehicle it must emit a green colored light and have a minimum area equivalent to a $\frac{3}{16}$ in diameter circle.

S9.3.4.2 If the indicator is located outside of the vehicle it must emit a yellow light and have a minimum projected illuminated area of 0.1 sq in.

S9.3.5 The minimum required illuminated area of the indicator must be visible to any tangent on the 95th eyellipse as defined in SAE Recommended Practice J941b (1969) (incorporated by reference, see §571.5), with the steering wheel turned to a straight ahead driving position and in the design location for an adjustable wheel or column.

S9.3.6 *Turn signal lamp failure.* Failure of one or more turn signal lamps such that the minimum photometric performance specified in Tables VI or VII is not being met must be indicated by the turn signal pilot indicator by a “steady on”, “steady off”, or by a significant change in the flashing rate, except when a variable-load turn signal flasher is used on a multipurpose passenger vehicle, truck, or bus 2032 mm or more in overall width, on a truck that is capable of accommodating a slide in camper, or on any vehicle equipped to tow trailers.

S9.4 *Headlamp beam switching device.* Each vehicle must have a means of switching between lower and upper beams designed and located so that it may be operated conveniently by a simple movement of the driver's hand or foot. The switch must have no dead

point and, except as provided by S6.1.5.2, the lower and upper beams must not be energized simultaneously except momentarily for temporary signaling purposes or during switching between beams.

S9.4.1 *Semi-automatic headlamp beam switching device.* As an alternative to S9.4, a vehicle may be equipped with a semi-automatic means of switching between lower and upper beams.

S9.4.1.1 *Operating instructions.* Each semi-automatic headlamp switching device must include operating instructions to permit a driver to operate the device correctly including; how to turn the automatic control on and off, how to adjust the provided sensitivity control, and any other specific instructions applicable to the particular device.

S9.4.1.2 *Manual override.* The device must include a means convenient to the driver for switching to the opposite beam from the one provided.

S9.4.1.3 *Fail safe operation.* A failure of the automatic control portion of the device must not result in the loss of manual operation of both upper and lower beams.

S9.4.1.4 *Automatic dimming indicator.* There must be a convenient means of informing the driver when the device is controlling the headlamps automatically. The device shall not affect the function of the upper beam indicator light.

S9.4.1.5 *Lens accessibility.* The device lens must be accessible for cleaning when the device is installed on a vehicle.

S9.4.1.6 *Mounting height.* The center of the device lens must be mounted no less than 24 in. above the road surface.

S9.4.1.7 *Physical tests.* Each semi-automatic headlamp beam switching device must be designed to conform to all applicable performance requirements of S14.9.

S9.5 *Upper beam headlamp indicator.* Each vehicle must have a means for indicating to the driver when the upper beams of the headlighting system are activated.

S9.5.1 *Indicator size and location.* The upper beam headlamp indicator must have a minimum area equivalent to that of a $\frac{3}{16}$ in diameter circle, and be plainly visible to drivers of all heights under normal driving conditions when headlamps are required.

S9.6 Vehicular hazard warning signal operating unit.

S9.6.1 The unit may be an independent device or it may be combined with the turn signal operating unit. If combined with the turn signal operating unit, the actuating motion of the hazard function must differ from the actuating motion of the turn signal function.

S9.6.2 *Operating unit switch.* The unit must operate independently of the ignition or equivalent switch. If the actuation of the hazard function requires the operation of more than one switch, a means must be provided for actuating all switches simultaneously by a single driver action.

S9.6.3 *Physical tests.* Each vehicular hazard warning signal operating unit must be designed to conform to all applicable performance requirements of S14.9.

S9.7 Vehicular hazard warning signal flasher.

Vehicle Maintenance Pro

S9.7.1 The means of producing the hazard warning signal pilot indicator signal may be incorporated in the flasher. A means of producing an audible signal may be incorporated in the flasher.

S9.7.2 *Physical tests.* Each vehicular hazard warning signal flasher must be designed to conform to all applicable performance requirements of S14.9.

S9.8 *Vehicular hazard warning signal pilot indicator.*

S9.8.1 In vehicles equipped with right hand and left hand turn signal pilot indicators, both pilot indicators and /or a separate pilot indicator must flash simultaneously while the vehicle hazard warning signal operating unit is turned on.

S9.8.2 In vehicles equipped with a single turn signal pilot indicator, a separate vehicular hazard warning signal pilot indicator must flash and the turn signal pilot indicator may flash while the vehicle hazard warning signal operating unit is turned on.

S9.8.3 The indicator must function satisfactorily under all test conditions imposed on the vehicular hazard warning signal flasher in S14.9.

S9.8.4 *Indicator size and color.* If the vehicular hazard warning signal pilot indicator is not combined with the turn signal pilot indicator, it must emit a red color and have a minimum area equivalent to a 0.5 in diameter circle.

S10 *Headlighting system requirements*

S10.1 *Vehicle headlighting systems.*

S10.1.1 Each passenger car, multipurpose passenger vehicle, truck and bus must be equipped with a headlighting system conforming to the requirements of Table II and this standard.

S10.1.2 Each motorcycle must be equipped with a headlighting system conforming to S10.17 of this standard.

S10.2 [Reserved]

S10.3 *Number.* See Tables I-a and I-c.

S10.4 *Color of light.* See Tables I-a and I-c.

S10.5 *Mounting location.* See Tables I-a and I-c and S6.1.3.5.

S10.6 *Mounting height.* See Tables I-a and I-c.

S10.7 *Activation.* See Tables I-a and I-c, Table II, and S6.1.5.

S10.8 *Effective projected luminous lens area.* No requirement.

S10.9 *Visibility.* No requirement.

S10.10 *Indicator.* See S9.5.

S10.11 *Markings.* See S6.5.

S10.12 *Spacing to other lamps.* See S6.1.3.5.

S10.13 *Sealed beam headlighting systems.* All sealed beam headlighting systems must be of a type designated in Table II-a. Each sealed beam headlamp must be designed to conform to the specifications furnished with respect to it pursuant to Appendix C of part 564 of this chapter and Table II-a of this standard. The dimensions applicable to the design of a specific type are those identified with an "I" for interchangeability specified on the applicable drawing(s) filed in Docket No. NHTSA 98-3397.

S10.13.1 *Installation.* A sealed beam headlighting system must consist of the correct number of designated headlamp units as specified for the applicable system in Table II-a. The units must have their beams activated as specified in Table II-a. A system must provide in total not more than two upper beams and two lower beams.

S10.13.2 *Simultaneous aim.* Type F sealed beam headlamps may be mounted on common or parallel seating and aiming planes to permit simultaneous aiming of both headlamps provided that there is no provision for adjustment between the common or parallel aiming and seating planes of the two lamps. When tested with any conforming Type UF and LF headlamps in accordance with S14.2.5, the assembly (consisting of the Type UF and LF headlamps, mounting rings, the aiming/seating rings, and aim adjustment mechanism) must be designed to conform to the applicable photometric requirements.

S10.13.3 *Photometry.* Each sealed beam headlamp must be designed to conform to the photometry requirements of Table XVIII for upper beam and Table XIX for lower beam as specified in Table II-a for the specific headlamp unit and aiming method, when tested according to the procedure of S14.2.5.

S10.13.4 *Physical tests.*

S10.13.4.1 Each sealed beam headlamp must be designed to conform to the performance requirements of the corrosion test, vibration test, inward force test (for lamps which are externally aimed only), torque deflection test (for lamps which are externally aimed only), headlamp connector test, headlamp wattage test, and aiming adjustment tests of S14.6.

S10.13.4.2 Each sealed beam headlamp except a Type G or Type H must be designed to conform to the performance requirements of the retaining ring test of S14.6.

S10.13.4.3 Each sealed beam headlamp must be designed to conform to the performance requirements of the color test of S14.4. Each sealed beam headlamp that does not incorporate a glass lens must be designed to conform to the plastic optical materials test of S14.4.

S10.14 *Integral beam headlighting systems.* All integral beam headlighting systems must be of a type designated in Table II-c.

S10.14.1 *Installation.* An integral beam headlighting system must consist of the correct number of designated headlamp units as specified for the applicable system in Table II-c. The units must have their beams activated as specified in Table II-c. A system must provide in total not more than two upper beams and two lower beams.

S10.14.2 *Aimability.*

S10.14.2.1 A system that incorporates any headlamp or beam contributor that does not have a VHAD as an integral and indivisible part of the headlamp or beam contributor must be designed so that the applicable photometric requirements are met when any correctly aimed and photometrically conforming headlamp or beam contributor is removed from its mounting and aiming mechanism, and is replaced without reaim by any conforming headlamp or beam contributor of the same type.

Regulations

S10.14.2.2 A system that incorporates more than one beam contributor providing a lower beam, and/or more than one beam contributor providing an upper beam, shall be designed to conform to the on-vehicle aiming requirements specified in S10.18.8.

S10.14.3 *Simultaneous aim.* An integral beam headlighting system consisting of four individual headlamps or beam contributors may have the headlamp units mounted in an assembly to permit simultaneous aiming of the beam(s) contributors, providing that with any complying contributor the assembly complete with all lamps meets the applicable photometric requirements when tested in accordance with S14.2.5.

S10.14.4 *Markings.* An integral beam headlamp with a single light source providing the lower beam must have its lens permanently marked with “L”. An integral beam headlamp with a single light source providing the upper beam must have its lens permanently marked with “U”.

S10.14.5 *Additional light sources.* An integral beam headlamp may incorporate light sources that are used for purposes other than headlighting and are capable of being replaced.

S10.14.6 *Photometry.* Each integral beam headlamp must be designed to conform to the photometry requirements of Table XVIII for upper beam and Table XIX for lower beam as specified in Table II-c for the specific headlamp unit and aiming method, when tested according to the procedure of S14.2.5.

S10.14.7 *Physical tests.*

S10.14.7.1 Each integral beam headlamp must be designed to conform to the performance requirements of the corrosion test, temperature cycle test, vibration test, inward force test (for lamps which are externally aimed only), headlamp connector test, and aiming adjustment tests of S14.6.

S10.14.7.2 Each integral beam headlamp that is not designed to conform to the performance requirements of the sealing test of S14.6 must be designed to conform to the performance requirements of the connector-corrosion test, dust test, and humidity test of S14.6.

S10.14.7.3 Each integral beam headlamp except those with a glass lens must be designed to conform to the performance requirements of the abrasion test of S14.6.

S10.14.7.4 Each integral beam headlamp except those with a nonreplaceable glass lens must be designed to conform to the performance requirements of the chemical resistance test of S14.6.

S10.14.7.5 Each integral beam headlamp except those with a glass lens and a non-plastic reflector must be designed to conform to the performance requirements of the internal heat test of S14.6.

S10.14.7.6 Each integral beam headlamp incorporating a replaceable lens must be designed to conform to the performance requirements of the chemical resistance of reflectors of replaceable lens headlamps test and the corrosion resistance of reflectors of replaceable lens headlamps test of S14.6.

S10.14.7.7 Each integral beam headlamp capable of being mechanically aimed by externally applied head-

lamp aiming devices specified in SAE Recommended Practice J602-1980 (incorporated by reference, see §571.5), must be designed to conform to the performance requirements of the torque deflection test of S14.6.

S10.14.7.8 Each integral beam headlamp must be designed to conform to the performance requirements of the color test of S14.4. Each integral beam headlamp that does not incorporate a glass lens must be designed to conform to the performance requirements of the plastic optical materials test of S14.4.

S10.15 *Replaceable bulb headlighting systems.* All replaceable bulb headlighting systems must be of a type designated in Table II-d.

S10.15.1 *Installation.* A replaceable bulb headlighting system must consist of either two or four headlamps as specified for the applicable system in Table II-d. The headlamps must have their beams activated as specified in Table II-d. A system must provide in total not more than two upper beams and two lower beams and must incorporate not more than two replaceable light sources in each headlamp.

S10.15.2 *Aiming restrictions.* Each replaceable bulb headlamp designed to conform to the external aiming requirements of S10.18.7 must have no mechanism that allows adjustment of an individual light source, or if there are two light sources, independent adjustments of each reflector.

S10.15.3 *Replacement lens reflector units.* Each lens reflector unit manufactured as replacement equipment must be designed to conform to applicable photometry requirements when any replaceable light source designated for such a unit is inserted in it.

S10.15.4 *Markings.*

S10.15.4.1 A replaceable bulb headlamp in a four headlamp system providing lower beam must have its lens permanently marked with “L”. A replaceable bulb headlamp in a four headlamp system providing upper beam must have its lens permanently marked with “U”.

S10.15.4.1.1 No such markings are required if the light sources in the headlamp are any combination of dual filament light sources other than HB2.

S10.15.5 *Additional light sources.* A replaceable bulb headlamp may incorporate replaceable light sources that are used for purposes other than headlighting.

S10.15.6 *Photometry.* Each replaceable bulb headlamp must be designed to conform to the photometry requirements of Table XVIII for upper beam and Table XIX for lower beam as specified in Table II-d for the specific headlamp unit and aiming method, when tested according to the procedure of S14.2.5 using any replaceable light source designated for use in the system under test.

S10.15.7 *Physical tests.*

S10.15.7.1 Each replaceable bulb headlamp must be designed to conform to the performance requirements of the corrosion test, corrosion-connector test, dust test, temperature cycle test, humidity test, vibration test, inward force test (for lamps which are externally aimed only), headlamp connector test, and aiming adjustment tests of S14.6.

Vehicle Maintenance Pro

S10.15.7.2 Each replaceable bulb headlamp except those with a glass lens must be designed to conform to the performance requirements of the abrasion test of S14.6.

S10.15.7.3 Each replaceable bulb headlamp except those with a nonreplaceable glass lens must be designed to conform to the performance requirements of the chemical resistance test of S14.6.

S10.15.7.4 Each replaceable bulb headlamp except those with a glass lens and a non-plastic reflector must be designed to conform to the performance requirements of the internal heat test of S14.6.

S10.15.7.5 Each replaceable bulb headlamp incorporating a replaceable lens must be designed to conform to the performance requirements of the chemical resistance of reflectors of replaceable lens headlamps test and the corrosion resistance of reflectors of replaceable lens headlamps test of S14.6.

S10.15.7.6 Each replaceable bulb headlamp capable of being mechanically aimed by externally applied headlamp aiming devices specified in SAE Recommended Practice J602-1980 (incorporated by reference, see §571.5), must be designed to conform to the performance requirements of the torque deflection test of S14.6.

S10.15.7.7 Each replaceable bulb headlamp must be designed to conform to the performance requirements of the color test of S14.4. Each replaceable bulb headlamp that does not incorporate a glass lens must be designed to conform to the performance requirements of the plastic optical materials test of S14.4.

S10.16 *Combination headlighting systems.* All combination headlighting systems must be of a type designated in Table II-b.

S10.16.1 *Installation.* A combination headlighting system must consist of the correct number of designated headlamp units as specified for the applicable system in Table II-b. The units must have their beams activated as specified in Table II-b. A system must provide in total not more than two upper beams and two lower beams. When installed on a motor vehicle, the headlamps (or parts thereof) that provide the lower beam must be of the same type, and provide a symmetrical effective projected luminous lens area when illuminated.

S10.16.2 *Photometry.* Each combination headlamp must be designed to conform to the photometry requirements of Table XVIII for upper beam and Table XIX for lower beam as specified in Table II-b for the specific headlamp unit and aiming method, when tested according to the procedure of S14.2.5.

S10.16.3 *Physical tests.*

S10.16.3.1 Any component headlamp of a combination headlighting system that is a Type F sealed beam headlamp must be designed to conform to the performance requirements of S10.13.4.

S10.16.3.2 Any component headlamp of a combination headlighting system that is an integral beam headlamp must be designed to conform to the performance requirements of S10.14.7.

S10.16.3.3 Any component headlamp of a combination headlighting system that is a replaceable bulb

headlamp must be designed to conform to the performance requirements of S10.15.7.

S10.17 *Motorcycle headlighting systems.* A motorcycle headlighting system may consist of:

(a) One half of any headlighting system of Table II which provides both a full upper beam and full lower beam, and is designed to conform to the requirements for that headlamp type. Where more than one lamp must be used, the lamps shall be mounted vertically, with the lower beam as high as practicable, or

(b) A headlighting system designed to conform to the requirements of paragraphs S10.17.1 through S10.17.5.

S10.17.1 *Installation.* The headlighting system installed on a motorcycle must consist of one of the system types specified in this paragraph, and must be located on the front.

S10.17.1.1 *Single headlamp.*

S10.17.1.1.1 If the system consists of a single headlamp, it must be mounted on the vertical centerline of the motorcycle.

S10.17.1.1.2 If the headlamp contains more than one light source, each light source must be mounted on the vertical centerline with the upper beam no higher than the lower beam, or horizontally disposed about the vertical centerline and mounted at the same height.

S10.17.1.1.3 If the light sources are horizontally disposed about the vertical centerline, the distance between the closest edges of the effective projected luminous lens area in front of the light sources must not be greater than 200 mm.

S10.17.1.2 *Two headlamps with both beams.*

S10.17.1.2.1 If the system consists of two headlamps, each of which provides both an upper and lower beam, the headlamps must be mounted either at the same height and symmetrically disposed about the vertical centerline or mounted on the vertical centerline.

S10.17.1.2.2 If the headlamps are horizontally disposed about the vertical centerline, the distance between the closest edges of their effective projected luminous lens areas must not be greater than 200 mm.

S10.17.1.3 *Two headlamps, upper beam and lower beam.*

S10.17.1.3.1 If the system consists of two headlamps, one of which provides an upper beam and one of which provides the lower beam, the headlamps must be located on the vertical centerline with the upper beam no higher than the lower beam, or horizontally disposed about the vertical centerline and mounted at the same height.

S10.17.1.3.2 If the headlamps are horizontally disposed about the vertical centerline, the distance between the closest edges of their effective projected luminous lens areas must not be greater than 200 mm.

S10.17.2 *Motorcycle replaceable bulb headlamp marking.* Each replaceable bulb headlamp that is designed to conform to S10.17(b) and that is equipped with a light source other than a replaceable light source meeting the requirements of S11, must have the word "motorcycle" permanently marked on the lens in characters not less than 3 mm in height.

Regulations

S10.17.3 *Photometry*. Each motorcycle headlamp that is not designed to conform to S10.17(a), must be designed to conform to the photometry requirements of Table XX when tested according to the procedure of S14.2.5.

S10.17.4 *Physical tests*. Each motorcycle headlamp that is not designed to conform to S10.17(a) must be designed to conform to the performance requirements of the vibration test, moisture test, dust test, and corrosion test of S14.5, the out of focus test of S14.3, the color test of S14.4, and each motorcycle headlamp that does not incorporate a glass lens must be designed to conform to the performance requirements of the plastic optical materials test of S14.4.

S10.17.5 *Motorcycle headlamp modulation system*. A headlamp on a motorcycle may be activated to modulate either the upper beam or the lower beam from its maximum intensity to a lesser intensity, provided that:

S10.17.5.1 *Modulation*.

(a) The rate of modulation must be 240 ± 40 cycles per minute.

(b) The headlamp must be operated at maximum power for 50 to 70 percent of each cycle.

(c) The lowest intensity at any test point must be not less than 17 percent of the maximum intensity measured at the same point.

(d) The modulator switch must be wired in the power lead of the beam filament being modulated and not in the ground side of the circuit.

(e) Means must be provided so that both the lower beam and upper beam remain operable in the event of a modulator failure.

(f) The system must include a sensor mounted with the axis of its sensing element perpendicular to a horizontal plane. Headlamp modulation must cease whenever the level of light emitted by a tungsten filament light operating at 3000° Kelvin is either less than 270 lux of direct light for upward pointing sensors or less than 60 lux of reflected light for downward pointing sensors. The light is measured by a silicon cell type light meter that is located at the sensor and pointing in the same direction as the sensor. A Kodak Gray Card (Kodak R-27) is placed at ground level to simulate the road surface in testing downward pointing sensors.

(g) When tested in accordance with the test profile shown in Figure 9, the voltage drop across the modulator when the lamp is on at all test conditions for 12 volt systems and 6 volt systems must not be greater than 0.45 volt. The modulator must meet all the provisions of the standard after completion of the test profile shown in Figure 9.

(h) Means must be provided so that both the lower and upper beam function at design voltage when the headlamp control switch is in either the lower or upper beam position when the modulator is off.

S10.17.5.2 *Replacement modulators*. Each modulator not intended as original equipment, or its container, must be labeled with the maximum wattage, and the minimum wattage appropriate for its use.

S10.17.5.2.1 *Replacement performance*. Each modulator, not intended as original equipment, must comply with S10.17.5.1 (a) through (g) when connected to a headlamp of the maximum rated power and a headlamp of the minimum rated power, and must provide means so that the modulated beam functions at design voltage when the modulator is off.

S10.17.5.2.2 *Replacement instructions*. Instructions, with a diagram, must be provided for mounting the light sensor including location on the motorcycle, distance above the road surface, and orientation with respect to the light.

S10.18 *Headlamp aimability performance requirements (except for motorcycles)*.

S10.18.1 *Headlamp mounting and aiming*. Except as provided in this paragraph, each headlamp must be installed on a motor vehicle with a mounting and aiming mechanism that permits aim inspection and adjustment of both vertical and horizontal aim, and is accessible for those purposes without removal of any vehicle parts, except for protective covers removable without the use of tools.

S10.18.1.1 The axis of the light beams must be adjustable to the left, right, up, or down from the designed setting, the amount of adjustability to be determined by practical operating conditions and the type of equipment.

S10.18.1.2 The adjustments must be conveniently made by one person with tools ordinarily available. When the headlamps are secured, the aim will not be disturbed under ordinary conditions of service.

S10.18.2 *Headlamp aiming systems*. When a headlamp system is installed on a motor vehicle, it must be aimable with at least one of the following: An externally applied aiming device, as specified in S10.18.7; an on-vehicle headlamp aiming device installed by the vehicle or lamp manufacturer, as specified in S10.18.8; or by visual/optical means, as specified in S10.18.9.

S10.18.3 *Aim adjustment interaction*. When installed on the vehicle, adjustment of one aim axis through its full on-vehicle range must not cause the aim of the other axis to deviate more than $\pm 0.76^\circ$. If the performance specified is not achievable, the requirements of S10.18.3.1 apply, except that if the aiming mechanism is not a VHAD, the requirements specific to VHADs are not applicable, and the instruction must be specific to the aiming mechanism installed.

S10.18.3.1 Should the mechanism not meet the requirements of S10.18.3, a cautionary label must be placed adjacent to the mechanism stating the caution and including either the reason for the caution or the corrective action necessary. Each such label must also refer the reader to the vehicle operator's manual for complete instructions. Each such vehicle must be equipped with an operator's manual containing the complete instructions appropriate for the mechanism installed.

S10.18.4 *Horizontal adjustment-visually aimed headlamp*. A visually/optically aimable headlamp that has a lower beam must not have a horizontal adjustment

Vehicle Maintenance Pro

mechanism unless such mechanism meets the requirements of this standard for on vehicle aiming as specified in S10.18.8.

S10.18.5 *Optical axis marking.*

S10.18.5.1 *Optical axis marking-vehicle.* Each motor vehicle must be equipped with headlamps or beam contributors which have a mark or markings that are visible from the front of the headlamp when installed on the vehicle to identify the optical axis of the headlamp to assure proper horizontal and vertical alignment of the aiming screen or optical aiming equipment. The manufacturer is free to choose the design of the mark or markings. The mark or markings may be on the interior or exterior of the lens or indicated by a mark or central structure on the interior or exterior of the headlamp.

S10.18.5.2 *Optical axis marking-lamp.* Each headlamp or beam contributor that is not visually/optically aimable in accordance with S10.18.9 of this standard must be equipped with fiducial marks, aiming pads, or similar references of sufficient detail and accuracy, for determination of an appropriate vehicle plane to be used with the photometric procedures of S14.2.5 for correct alignment with the photometer axis when being tested for photometric compliance, and to serve for the aiming reference when the headlamp or beam contributor is installed on a motor vehicle. The fiducial marks, aiming pads, or similar references are protrusions, bubble vials, holes, indentations, ridges, scribed lines, or other readily identifiable marks established and described by the vehicle or headlamp manufacturer.

S10.18.5.3 *Optical axis marking-visual/optical aim headlamp.* There must be a mark or markings identifying the optical axis of the headlamp visible from the front of the headlamp when installed on the vehicle, to assure proper horizontal and vertical alignment of the aiming screen or optical aiming equipment with the headlamp being aimed. The manufacturer is free to choose the design of the mark or markings. The mark or markings may be on the interior or exterior of the lens or indicated by a mark or central structure on the interior or exterior of the headlamp.

S10.18.6 *Moveable reflectors.* Each headlamp aimed by moving the reflector relative to the lens and headlamp housing, or vice versa, must conform with the photometric requirements applicable to it when tested according to the procedure of S14.2.5 with the lens at any position relative to the reflector within the full range of vertical pitch on the vehicle on which the headlamp system is installed and a horizontal range of $\pm 2.5^\circ$. Additionally it must comply with the aiming adjustment requirements of S14.6.

S10.18.7 *External aiming.* Each headlighting system that is capable of being mechanically aimed by externally applied headlamp aiming devices must be mechanically aimable using the equipment specified in SAE Recommended Practice J602-1980 (incorporated by reference, see §571.5), without the removal of any ornamental trim rings, covers, wipers or other vehicle parts.

S10.18.7.1 *Headlamp aiming device locating plates.* Each headlighting system which is designed to use the Headlamp Aiming Device Locating Plates with adjust-

able legs for the 100×165 mm unit and the 142×200 mm unit, and which has adjustable length legs, must meet the following requirements:

S10.18.7.1.1 The lens must have three aiming pads which meet the requirements of Figure 4, *Dimensional Specifications for Location of Aiming Pads on Replaceable Bulb Headlamp Units*. The aiming pads need not be centered at the geometric center of the lens, or on the optical axis. Except as provided in S10.18.7.1.2, a whole number, which represents the distance in tenths of an inch (i.e. 0.3 inch = 3) from the aiming reference plane to the respective aiming pads which are not in contact with that plane, must be inscribed adjacent to each respective aiming pad on the lens. The height of these numbers must be not less than .157 inch (4 mm). If there is interference between the plane and the area of the lens between the aiming pads, the whole number represents the distance to a secondary plane. The secondary plane must be located parallel to the aiming reference plane and as close to the lens as possible without causing interference.

S10.18.7.1.2 If the most forward aiming pad is the lower inboard aiming pad, then the dimensions may be placed anywhere on the lens. The dimension for the outboard aiming pad (Dimension F in Figure 4) must be followed by the letter "H" and the dimension for the center aiming pad must be followed by the letter "V." The dimensions must be expressed in tenths of an inch.

S10.18.7.2 *Nonadjustable headlamp aiming device locating plates.* Each headlamp may be designed to use the nonadjustable Headlamp Aiming Device Locating Plate for the 100 × 165 mm unit, the 142 × 200 mm unit, the 146 mm diameter unit, or the 178 mm diameter unit of SAE Recommended Practice J602-1980 (incorporated by reference, see §571.5), or the 92 × 150 mm Type F unit, and incorporate lens-mounted aiming pads as specified for those units pursuant to Appendix C of part 564 of this chapter. If so designed, no additional lens marking is necessary to designate the type of plate or dimensions.

S10.18.8 *On-vehicle aiming.* Each headlighting system that is capable of being aimed by equipment installed on the vehicle must include a Vehicle Headlamp Aiming Device (VHAD) that conforms to the following requirements:

S10.18.8.1 *Aim.* The VHAD must provide for headlamp aim inspection and adjustment in both the vertical and horizontal axes.

S10.18.8.1.1 *Vertical aim.* The VHAD must include the necessary references and scales relative to the horizontal plane to assure correct vertical aim for photometry and aiming purposes. An off vehicle measurement of the angle of the plane of the ground is permitted. In addition, an equal number of graduations from the "0" position representing angular changes in the axis in the upward and downward directions must be provided.

S10.18.8.1.1.1 Each graduation must represent a change in the vertical position of the mechanical axis not larger than 0.19° (1 in at 25 ft) to provide for variations in aim at least 1.2° above and below the horizontal, and have an accuracy relative to the zero mark of less than 0.1° .

Regulations

S10.18.8.1.1.2 The VHAD must be marked to indicate headlamp aim movement in the upward and downward directions.

S10.18.8.1.1.3 Each graduation must indicate a linear movement of the scale indicator of not less than 0.05 in (1.27 mm) if a direct reading analog indicator is used. If a remote reading indicator is provided, it must represent the actual aim movement in a clear, understandable format.

S10.18.8.1.1.4 The vertical indicator must perform through a minimum range of $\pm 1.2^\circ$.

S10.18.8.1.1.5 Means must be provided in the VHAD for compensating for deviations in floor slope less than 1.2° from the horizontal that would affect the correct positioning of the headlamp for vertical aim.

S10.18.8.1.1.6 The graduations must be legible under an illumination level not greater than 30 foot candles, measured at the top of the graduation, by an observer having 20/20 vision (Snellen), and must permit aim adjustment to within 0.19° (1 in at 25 ft).

S10.18.8.1.2 *Horizontal aim.* The VHAD must include references and scales relative to the longitudinal axis of the vehicle necessary to assure correct horizontal aim for photometry and aiming purposes. An “0” mark must be used to indicate alignment of the headlamps relative to the longitudinal axis of the vehicle. In addition, an equal number of graduations from the “0” position representing equal angular changes in the axis relative to the vehicle axis must be provided.

S10.18.8.1.2.1 Each graduation must represent a change in the horizontal position of the mechanical axis not greater than 0.38° (2 in at 25 ft) to provide for variations in aim at least 0.76° (4 in at 25 ft) to the left and right of the longitudinal axis of the vehicle, and must have an accuracy relative to the zero mark of less than 0.1° .

S10.18.8.1.2.2 The VHAD must be marked to indicate headlamp aim movement in the left and right directions.

S10.18.8.1.2.3 The graduations must be legible under an illumination level not greater than 30 foot candles, measured at the top of the graduation, by an observer having 20/20 vision (Snellen), and must permit aim adjustment to within 0.38° (2 in at 25 ft).

S10.18.8.1.2.4 The horizontal indicator must perform through a minimum range of $\pm 0.76^\circ$ (4 in at 25 ft); however, the indicator itself must be capable of recalibration over a movement of $\pm 2.5^\circ$ relative to the longitudinal axis of the vehicle to accommodate any adjustment necessary for recalibrating the indicator after vehicle repair from accident damage.

S10.18.8.2 *Aiming instructions.*

S10.18.8.2.1 The instructions for properly aiming the headlighting system using the VHAD must be provided on a label permanently affixed to the vehicle adjacent to the VHAD, or in the vehicle operator’s manual. The instructions must advise that the headlighting system is properly aimed if the appropriate vertical plane (as defined by the vehicle manufacturer) is perpendicular to both the longitudinal axis of the vehicle, and a horizon-

tal plane when the vehicle is on a horizontal surface, and the VHAD is set at “0” vertical and “0” horizontal.

S10.18.8.2.2 Should a remote indicator or a remote indicator and adjuster be provided, the instructions must be placed in the operator’s manual, and may also be placed on a label adjacent to the VHAD.

S10.18.8.3 *Permanent calibration.* Each headlamp equipped with a VHAD must be manufactured with its calibration permanently fixed by its manufacturer. Calibration in this case means the process of accurately aligning the geometry of the VHAD devices with the beam pattern for the purposes of compliance with the standard.

S10.18.8.4 *Replacement units.* When tested according to the procedure of S14.2.5 with any replacement headlamp unit(s) or light sources intended for use in the system under test, the VHAD and headlighting system must be designed to conform to the photometric performance requirements applicable for the system under test.

S10.18.8.5 *Physical tests.* Each VHAD must be designed to conform with the performance requirements of S14.8.

S10.18.9 *Visual/optical aiming.* Each visually/optically aimable headlamp must be designed to conform to the following requirements:

S10.18.9.1 *Vertical aim, lower beam.* Each lower beam headlamp must have a cutoff in the beam pattern. It may be either on the left side or the right side of the optical axis, but once chosen for a particular headlamp system’s design, the side chosen for the cutoff must not be changed for any headlamps intended to be used as replacements for those system’s headlamps.

S10.18.9.1.1 *Vertical position of the cutoff.* The headlamp must be aimed vertically so that the cutoff is on the left side, at 0.4° down from the H-H line, or on the right side, at the H-H line.

S10.18.9.1.2 *Vertical gradient.* The gradient of the cutoff measured at either 2.5° L or 2.0° R must be not less than 0.13 based on the procedure of S10.18.9.1.5.

S10.18.9.1.3 *Horizontal position of the cutoff.* The width must be not less than 2° , with not less than 2° of its actual width centered at either 2.5° L, or 2.0° R.

S10.18.9.1.4 *Maximum inclination of the cutoff.* The vertical location of the highest gradient at the ends of the minimum width must be within $\pm 0.2^\circ$ of the vertical location of the maximum gradient measured at the appropriate vertical line (at either 2.5° L for a left side cutoff, or 2.0° R for a right side cutoff).

S10.18.9.1.5 *Measuring the cutoff parameter.*

S10.18.9.1.5.1 The headlamp is mounted on a headlamp test fixture which simulates its actual design location on any vehicle for which the headlamp is intended. The fixture, with the headlamp installed, is attached to the goniometer table in such a way that the fixture alignment axes are coincident with the goniometer axes. The headlamp is energized at the specified test voltage. The cutoff parameter must be measured at a distance of 10 m from a photosensor with a 10 mm diameter.

Vehicle Maintenance Pro

S10.18.9.1.5.2 The headlamp beam pattern is aimed with the cutoff at the H-H axis. There is no adjustment, shimming, or modification of the horizontal axis of the headlamp or test fixture, unless the headlamp is equipped with a VHAD. In this case the VHAD is adjusted to zero.

S10.18.9.1.5.3 A vertical scan of the beam pattern is conducted for a headlamp with a left side gradient by aligning the goniometer on a vertical line at 2.5° L and scanning from 1.5° U to 1.5° D. For a headlamp with a right side gradient, a vertical scan of the beam pattern is conducted by aligning the goniometer on a vertical line at 2.0° R and scanning from 1.5° U to 1.5° D.

S10.18.9.1.5.4 Determine the maximum gradient within the range of the scan by using the formula: $G = \log E(a) - \log E(a + 0.1)$, where “G” is the gradient, “E” is illumination and “a” is vertical angular position. The maximum value of the gradient “G” determines the vertical angular location of the cutoff. Perform vertical scans at 1.0° L and R of the measurement point of the maximum gradient to determine the inclination.

S10.18.9.2 *Horizontal aim, lower beam.* There is no adjustment of horizontal aim unless the headlamp is equipped with a horizontal VHAD. If the headlamp has a VHAD, it is set to zero.

S10.18.9.3 *Vertical aim, upper beam.*

S10.18.9.3.1 If the upper beam is combined in a headlamp with a lower beam, the vertical aim of the upper beam must not be changed from the aim set using the procedures of S10.18.9.1 and S10.18.9.2 used for the lower beam.

S10.18.9.3.2 If the upper beam is not combined in a headlamp with a lower beam, the vertical aim of the upper beam is adjusted so that the maximum beam intensity is located on the H-H axis.

S10.18.9.4 *Horizontal aim, upper beam.*

S10.18.9.4.1 If the upper beam is combined in a headlamp with a lower beam, the horizontal aim of the upper beam must not be changed from the aim set using the procedures of S10.18.9.1 and S10.18.9.2 used for the lower beam.

S10.18.9.4.2 If the upper beam is not combined in a headlamp with the lower beam and has fixed horizontal aim or has a horizontal VHAD, then the headlamp is mounted on a headlamp test fixture which simulates its actual design location on any vehicle for which the headlamp is intended. The fixture, with the headlamp installed, is attached to the goniometer table in such a way that the fixture alignment axes are coincident with the goniometer axes. The headlamp must be energized at 12.8 ± 0.20 mV. There is no adjustment, shimming, or modification of the horizontal axis of the headlamp or test fixture, unless the headlamp is equipped with a VHAD. In this case the VHAD is adjusted to zero.

S10.18.9.4.3 If the upper beam is not combined in a headlamp with a lower beam, and it does not have a VHAD, the horizontal aim of the upper beam is adjusted so that the maximum beam intensity is located on the V-V axis.

S10.18.9.5 *Photometry.* When tested according to the procedure of S14.2.5, a visually/optically aimable head-

lamp must be designed to conform to the lower beam requirements of columns; LB1V or LB2V of Table XIX-a, or LB3V of Table XIX-b, or LB4V of Table XIX-c.

S10.18.9.6 *Visual/optical aiming identification marking.* Each letter used in marking according to this paragraph must be not less than 3 mm high.

S10.18.9.6.1 The lens of a lower beam headlamp must be marked “VOL” if the headlamp is intended to be visually/optically aimed using the left side of the lower beam pattern. The lens of a lower beam headlamp must be marked “VOR” if the headlamp is intended to be visually/optically aimed using the right side of the lower beam pattern. The lens of a headlamp that is solely an upper beam headlamp and intended to be visually/optically aimed using the upper beam must be marked “VO”.

S10.18.9.6.2 The lens of each sealed beam or integral beam headlamp must be marked “VOR” if the headlamp is of a type that was manufactured before May 1, 1997, and if such headlamp type has been redesigned since then to be visually/optically aimable.

S11 *Replaceable light source requirements.* Each replaceable light source must be designed to conform to the dimensions and electrical specifications furnished with respect to it pursuant to part 564 of this chapter, on file in Docket No. NHTSA 98-3397, and must conform to the following requirements:

S11.1 *Markings.* If other than an HB Type, the light source must be marked with the bulb marking designation specified for it in compliance with Appendix A or Appendix B of part 564 of this chapter. The base of each HB Type must be marked with its HB Type designation. Each replaceable light source must also be marked with the symbol DOT and with a name or trademark in accordance with S6.5.

S11.2 *Ballast markings.* If a ballast is required for operation, each ballast must bear the following permanent markings:

- (a) Name or logo of ballast manufacturer;
- (b) Ballast part number or unique identification;
- (c) Part number or other unique identification of the light source for which the ballast is designed;
- (d) Rated laboratory life of the light source/ballast combination, if the information for the light source has been filed in Appendix B of part 564 of this chapter;
- (e) A warning that ballast output voltage presents the potential for severe electrical shock that could lead to permanent injury or death;
- (f) Ballast output power in watts and output voltage in rms volts AC or DC; and
- (g) The symbol ‘DOT’.

S11.3 *Gas discharge laboratory life.* For light sources that use excited gas mixtures as a filament or discharge arc, the “rated laboratory life” is determined in accordance with sections 4.3 and 4.9 of SAE Recommended Practice J2009 FEB93, Forward Discharge Lighting Systems (incorporated by reference, see 571.108 S5.2 of this title).

S11.4 *Physical tests.*

Regulations

S11.4.1 Each replaceable light source must be designed to conform with the performance requirements of the deflection test and pressure test requirements of S14.7.

S11.4.2 Replaceable light sources must be designed to conform with the requirements of section VII of Appendix A of part 564 of this chapter, or section IV of Appendix B of part 564 of this chapter, for maximum power and luminous flux when test by the procedure of S14.7.3.

S12 Headlamp concealment device requirements.

S12.1 While the headlamp is illuminated, its fully opened headlamp concealment device must remain fully opened should any loss of power to or within the headlamp concealment device occur.

S12.2 Whenever any malfunction occurs in a component that controls or conducts power for the actuation of the concealment device, each closed headlamp concealment device must be capable of being fully opened by a means not requiring the use of any tools. Thereafter, the headlamp concealment device must remain fully opened until intentionally closed.

S12.3 Except for malfunctions covered by S12.2, each headlamp concealment device must be capable of being fully opened and the headlamps illuminated by actuation of a single switch, lever, or similar mechanism, including a mechanism that is automatically actuated by a change in ambient light conditions.

S12.4 Each headlamp concealment device must be installed so that the headlamp may be mounted, aimed, and adjusted without removing any component of the device, other than components of the headlamp assembly.

S12.5 Except for cases of malfunction covered by S12.2, each headlamp concealment device must, within an ambient temperature range of -20°F to $+120^{\circ}\text{F}$, be capable of being fully opened in not more than 3 seconds after the actuation of a driver-operated control.

S12.6 As an alternative to complying with the requirements of S12.1 through S12.5, a vehicle with headlamps incorporating VHAD or visual/optical aiming in accordance with this standard may meet the requirements for concealable lamps in paragraph 5.14 of UNECE Regulation 48 page 17 (incorporated by reference, see §571.5), in the English language version.

S12.7 *Certification election.* Manufacturers of vehicles with headlamps incorporating VHAD or visual/optical aiming must elect to certify to S12.1 through S12.5 or to S12.6 prior to, or at the time of certification of the vehicle, pursuant to 49 CFR Part 567. The selection is irrevocable.

S13 Replaceable headlamp lens requirements.

S13.1 A replacement lens for a replaceable bulb headlamp or integral beam headlamp that is not required to have a bonded lens must be provided with a replacement seal in a package that includes instructions for the removal and replacement of the lens, the cleaning of the reflector, and the sealing of the replacement lens to the reflector assembly.

S13.2 Each replacement headlamp lens with seal, when installed according to the lens manufacturer's in-

structions on an integral beam or replaceable bulb headlamp, must not cause the headlamp to fail to comply with any of the requirements of this standard.

S14 Physical and photometry test procedures and performance requirements.

S14.1 General test procedures and performance requirements.

S14.1.1 Each lamp, reflective device, item of conspicuity treatment, and item of associated equipment required or permitted by this standard must be designed to conform to all applicable physical test performance requirements specified for it.

S14.1.2 *Plastic optical materials.* All plastic materials used for optical parts such as lenses and reflectors on lamps or reflective devices required or allowed by this standard must conform to the material test requirements of S14.4.2.

S14.1.3 All coatings used on optical materials must have added to their formulations an optical brightener, whose presence is detectable by ultraviolet light, to aid in testing for their presence. Other equivalent industry accepted methods may be used as an alternative.

S14.1.4 Samples.

S14.1.4.1 Samples submitted for laboratory test must be new, unused, manufactured from production tooling and assembled by production processes, and representative of the devices as regularly manufactured and marketed.

S14.1.4.2 Each test sample must include not only the device but also accessory equipment necessary to operate in its intended manner. Where necessary a mounting bracket shall be provided so that the device may be rigidly bolted in its operating position on the various test equipment.

S14.1.4.3 Dust and photometric tests may be made on a second set of mounted samples, if desired, to expedite completion of the tests.

S14.1.5 *Laboratory facilities.* The laboratory must be equipped to test the sample in accordance with the requirements of the specific device.

S14.2 *Photometric test procedures.* Each lamp and reflective device required or permitted by this standard must be designed to conform to the applicable photometric requirements.

S14.2.1 Photometry measurements for all lamps except license plate lamps, headlamps, and DRLs.

S14.2.1.1 *Mounting.* Photometry measurements are made with the sample lamp mounted in its normal operating position.

S14.2.1.2 *School bus signal lamp aiming.* A school bus signal lamp must be aimed with its aiming plane normal to the photometer axis and may be reaimed for photometry by $\pm 1/2^{\circ}$ vertically and $\pm 1^{\circ}$ horizontally.

S14.2.1.3 *Measurement distance.* Photometric measurements are made at a distance between the light source and the point of measurement of at least 1.2 m for side marker lamps, clearance lamps, identification lamps, and parking lamps, and at least 3 m for turn signal lamps, stop lamps, taillamps, backup lamps, and school bus signal lamps.

Vehicle Maintenance Pro

S14.2.1.4 *Location of test points.* Test point location must comply with the following nomenclature:

(a) The line formed by the intersection of a vertical plane through the light source of the lamp and normal to the test screen is designated “V”.

(b) The line formed by the intersection of a horizontal plane through the light source and normal to the test screen is designated “H”.

(c) The point of intersection of these two lines is designated “H-V”.

(d) Other test points on the test screen are measured in terms of angles from the H and V lines.

(e) Angles to the right (R) and to the left (L) are regarded as being to the right and left of the V line when the observer stands behind the lamp and looks in the direction of its light beam when it is properly aimed for photometry. Similarly, the upward angles designated as U and the downward angles designated as D, refer to light directed at angles above and below the H line, respectively.

S14.2.1.5 *Multiple compartment and multiple lamp photometry of turn signal lamps, stop lamps, and tail-lamps.*

S14.2.1.5.1 When compartments of lamps or arrangements of multiple lamps are photometered together, the H-V axis intersects the midpoint between the optical axes.

S14.2.1.5.2 Luminous intensity measurements of multiple compartment lamps or multiple lamp arrangements are made either by:

(a) Measuring all compartments together, provided that a line from the optical axis of each compartment or lamp to the center of the photometer sensing device does not make an angle more than 0.6° with the H-V axis, or

(b) Measuring each compartment or lamp separately by aligning its optical axis with the photometer and adding the value at each test point.

S14.2.1.5.3 Multiple compartment turn signal lamps or stop lamps or multiple lamp arrangements of these lamps installed on multipurpose passenger vehicles, trucks, trailers, or buses 2032 mm or more in overall width must use the method of S14.2.1.5.2(b) only.

S14.2.1.6 *Bulbs.* Except for a lamp having a sealed-in bulb, a lamp must meet the applicable requirements of this standard when tested with a bulb whose filament is positioned within $\pm .010$ in of the nominal design position specified in SAE Recommended Practice J573d (1968) (incorporated by reference, see §571.5) or specified by the bulb manufacturer and operated at the bulb's rated mean spherical candela.

S14.2.1.6.1 Each lamp designed to use a type of bulb that has not been assigned a mean spherical candela rating by its manufacturer and is not listed in SAE Recommended Practice J573d (1968) (incorporated by reference, see §571.5), must meet the applicable requirements of this standard when used with any bulb of the type specified by the lamp manufacturer, operated at the bulb's design voltage. A lamp that contains a

sealed-in bulb must meet these requirements with the bulb operated at the bulb's design voltage.

S14.2.1.6.2 A bulb that is not listed in SAE Recommended Practice J573d (1968) (incorporated by reference, see §571.5) is not required to use a socket that conforms to the requirements of SAE Recommended Practice J567b (1964) (incorporated by reference, see §571.5).

S14.2.2 *License plate lamp photometry.* Photometry compliance of license plate lamps is determined by measurement of the illumination falling upon test stations located on a test plate.

S14.2.2.1 *Illumination surface.* All illumination measurements are made on a rectangular test plate of clean, white blotting paper mounted on the license plate holder in the position normally taken by the license plate. The face of the test plate must be 1.5 mm from the face of the license plate holder.

S14.2.2.2 *Test stations.* Test stations must be located on the face of the test plate as shown in Figure 19 according to the type of vehicle on which the license plate lamps are installed.

S14.2.2.3 Bulb requirements of S14.2.1.6 apply to license plate lamp photometry.

S14.2.3 *Reflex reflector and retroreflective sheeting photometry.*

S14.2.3.1 *Mounting.* Each reflex reflector is mounted for photometry with the center of the reflex area at the center of goniometer rotation and at the same horizontal level as the source of illumination.

S14.2.3.2 *Illumination source.* The source of illumination is a lamp with a 50 mm effective diameter and with a filament operating at 2856 °K.

S14.2.3.3 *Measurement distance.* The test distance is 30.5 m [100ft].

S14.2.3.4 *Test setup* The observation point is located directly above the source of illumination. The H-V axis of reflex reflectors is taken as parallel to the longitudinal axis of the vehicle for rear reflectors and perpendicular to a vertical plane passing through the longitudinal axis of the vehicle for side reflectors.

S14.2.3.5 *Photodetector.* The photodetector has an opening of not more than 13 mm vertically and 25 mm horizontally.

S14.2.3.6 *Photometry surface.* Reflex reflectors may have any linear or area dimensions but must have no more than 7740 sq mm projected area contained within a 254 mm diameter circle exposed for photometry.

S14.2.3.7 *Procedure.* Photometric measurements of reflex reflectors and retroreflective sheeting must be made at various observation and entrance angles as shown in Table XVI.

S14.2.3.7.1 The observation angle is the angle formed by a line from the observation point to the center of the reflector and a second line from the center of the reflector to the source of illumination.

S14.2.3.7.2 The entrance angle is the angle between the axis of the reflex reflector and a line from the center of the reflector to the source of illumination.

Regulations

S14.2.3.7.3 The entrance angle is designated left, right, up, and down in accordance with the position of the source of illumination with respect to the axis of the reflex reflector as viewed from behind the reflector.

S14.2.3.7.4 Measurements are made of the luminous intensity which the reflex reflector is projecting toward the observation point and the illumination on the reflex reflector from the source of illumination.

S14.2.3.8 *Measurements.*

S14.2.3.8.1 *Reflex reflectors.* The required measurement for reflex reflectors at each test point as shown in Table XVI is the quotient of the projected luminous intensity divided by the illumination expressed as millicandela per lux or candela per footcandle.

S14.2.3.8.2 *Retroreflective sheeting.* The required measurement for retroreflective sheeting reflectors at each test point as shown in Table XVI is candela per lux per square meter of area.

S14.2.3.8.3 *Reflex reflector photometry measurement adjustments.*

S14.2.3.8.3.1 Reflex reflectors, which do not have a fixed rotational position on the vehicle, are rotated about their axis through 360° to find the minimum photometric value which must be reported for each test point. If the output falls below the minimum requirement at any test point, the reflector is rotated $\pm 5^\circ$ about its axis from the angle where the minimum output occurred, and the maximum value within this angle is reported as a tolerance value.

S14.2.3.8.3.2 Reflex reflectors, which by their design or construction, permit mounting on a vehicle in a fixed rotational position, are tested in this position. A visual locator, such as the word TOP is not considered adequate to establish a fixed rotational position on the vehicle.

S14.2.3.8.3.3 If uncolored reflections from the front surface interfere with photometric readings at any test point, additional readings are taken 1° above, below, right, and left of the test point, and the lowest of these readings and its location is reported provided the minimum test point requirement for the test point is met.

S14.2.4 *Daytime running lamp (DRL) photometry measurements.*

S14.2.4.1 Each DRL is tested to the procedure of S14.2.5 when a test voltage of $12.8 \text{ v} \pm 20 \text{ mv}$ is applied to the input terminals of the lamp switch module or voltage-reducing equipment, whichever is closer to the electrical source on the vehicle.

S14.2.4.2 The test distance from the lamp to the photometer is not less than 18.3 m if the lamp is optically combined with a headlamp, or is a separate lamp, and not less than 3 m if the lamp is optically combined with a lamp, other than a headlamp, that is required by this standard.

S14.2.4.3 Except for a lamp having a sealed-in bulb, a lamp must meet the applicable requirements of this standard when tested with a bulb whose filament is positioned within $\pm 0.10 \text{ in.}$ of the nominal design position specified in SAE J573d, Lamp bulbs and Sealed Units, December 1968, (incorporated by reference, para-

graph S5.2 of this section) or specified by the bulb manufacturer.

S14.2.5 *Headlamp photometry measurements.*

S14.2.5.1 *Mounting.* Photometry measurements at the applicable test points are made with the sample headlamp mounted in its normal operating position.

S14.2.5.2 Test points in the area from 10° U to 90° U must be measured from the normally exposed surface of the lens face.

S14.2.5.3 *Measurement distance.* Photometric measurements are made at a distance between the light source and the photometer sensor of at least 18.3 m.

S14.2.5.4 *Seasoning and test voltage.* All sealed beam headlamps, integral beam headlamps, beam contributors, and replaceable light sources are seasoned at design voltage for 1% of its average design life or 10 hours, whichever is less prior to a photometry test. A headlamp is tested at $12.8 \text{ v.} \pm 20 \text{ mv, D.C.}$ as measured at the terminals of the lamp.

S14.2.5.5 *Aiming.* Each headlamp is aimed prior to a photometry test in accordance with the procedure appropriate to its aiming system. A $\frac{1}{4}^\circ$ reaim is permitted in any direction at any test point to allow for variations in readings between laboratories for all headlamps except a Type F upper beam unit not equipped with a VHAD.

S14.2.5.5.1 *Mechanically aimable headlamps using an external aimer.* The headlamp is aimed mechanically with the aiming plane at the design angle(s) to the photometer axis and the mechanical axis of the headlamp on the photometer axis.

S14.2.5.5.2 *Mechanically aimable headlamps equipped with a VHAD.* The headlamp is aimed mechanically using the VHAD in accordance with the manufacturer's instructions as provided with the vehicle on which the headlamp is intended to be used.

S14.2.5.5.3 *Visually aimable lower beam headlamps-vertical aim.*

S14.2.5.5.3.1 A VOL cutoff headlamp must have the location of the cutoff maximum gradient, as determined by the method of this standard, positioned at 0.4° down from the H-H line.

S14.2.5.5.3.2 A VOR cutoff headlamp must have the location of the cutoff maximum gradient, as determined by the method of this standard, positioned at the H-H line.

S14.2.5.5.4 *Visually aimable lower beam headlamps-horizontal aim.* There must be no adjustment of horizontal aim unless the headlamp is equipped with a horizontal VHAD. If the headlamp has a VHAD, it must be set to zero.

S14.2.5.5.5 *Visually aimable upper beam headlamps-vertical aim.*

S14.2.5.5.5.1 A headlamp whose upper beam is combined with a lower beam must not have its vertical aim changed from that set for the lower beam.

S14.2.5.5.5.2 A headlamp whose upper beam is not combined with a lower beam must have its maximum beam intensity positioned on the H-H axis.

Vehicle Maintenance Pro

S14.2.5.5.6 *Visually aimable upper beam headlamps-horizontal aim.*

S14.2.5.5.6.1 A headlamp whose upper beam is combined with a lower beam must not have its horizontal aim changed from that set for the lower beam.

S14.2.5.5.6.2 A headlamp whose upper beam is not combined with a lower beam and has a fixed horizontal aim or has a horizontal VHAD must be mounted in its normal operating position on a goniometer such that the mounting fixture alignment axes are coincident with the goniometer axes and must be energized at $12.8 \text{ v} \pm 20 \text{ mv}$. There must be no adjustment, shimming, or modification of the horizontal axis of the headlamp or test fixture, unless the headlamp is equipped with a VHAD, in which case the VHAD must be adjusted to zero.

S14.2.5.5.6.3 A headlamp whose upper beam is not combined with a lower beam and is not equipped with a horizontal VHAD, the horizontal aim must be adjusted so that the maximum beam intensity is positioned on the V-V axis.

S14.2.5.5.7 *Simultaneous aim Type F sealed beam headlamps and beam contributor integral beam headlamps.*

S14.2.5.5.7.1 A headlamp system permitted to use simultaneous aim of lower beams and upper beams must be aimed mechanically for lower beam photometry by centering the lower beam unit or the geometric center of all lower beam contributors on the photometer axis and aligning the aiming plane, aiming reference plane, or other appropriate vertical plane defined by the manufacturer perpendicular to the photometer axis.

S14.2.5.5.7.2 The headlamp must be aimed for upper beam photometry by moving the assembly in a plane parallel to the established lower beam aiming plane until the upper beam unit or the geometric center of all upper beam contributors is centered in the photometric axis.

S14.2.5.5.8 *Motorcycle headlamp-upper beam headlamps designed to comply with Table XX.* The upper beam of a multiple beam headlamp designed to comply with the requirements of Table XX must be aimed photoelectrically so that the center of the zone of highest intensity falls 0.4° vertically below the lamp axis and is centered laterally. The center of the zone of highest intensity must be established by the intersection of a horizontal plane passing through the point of maximum intensity, and the vertical plane established by balancing the photometric values at 3°L and 3°R .

S14.2.5.5.9 *Motorcycle headlamp-lower beam headlamps designed to comply with Table XX.* The beam from a single beam headlamp designed to comply with the requirements of Table XX must be aimed straight ahead with the top of the beam aimed vertically to obtain 2000 cd at H-V.

S14.2.5.6 *Positioner.* The goniometer configuration, used to position the sample headlamp when making photometric measurements at specific angular test points, is horizontal rotation over elevation. The vertical axis of the goniometer must correspond to the design position vertical axis of the sample headlamp which is

vertical and perpendicular to the longitudinal axis of the vehicle.

S14.2.5.7 *Photometer.*

S14.2.5.7.1 The photometer must be capable of measuring the luminous intensity of the sample headlamp throughout its illumination range.

S14.2.5.7.2 *Sensor.*

S14.2.5.7.2.1 The maximum effective area of the photometric sensor must fit within a circle whose diameter is equal to 0.009 times the actual test distance from the light source of the sample headlamp to the sensor.

S14.2.5.7.2.2 The sensor effective area is defined as the actual area of intercepted light striking the detector surface of the photometer. Sensor systems incorporating lens(es) that change the diameter of the intercepted light beam before it reaches the actual detector surface, the maximum size requirements must apply to the total area of the light actually intercepted by the lens surface.

S14.2.5.7.2.3 The sensor must be capable of intercepting all direct illumination from the largest illuminated dimension of the sample lamp at the test distance.

S14.2.5.7.3 The color response of the photometer must be corrected to that of the 1931 CIE Standard Observer (2-degree) Photopic Response Curve, as shown in the CIE 1931 Chromaticity Diagram (incorporated by reference, see §571.5).

S14.2.5.8 *Location of test points.*

S14.2.5.8.1 Test point positions are defined by the positioner. The following nomenclature applies:

S14.2.5.8.1.1 The letters "V" and "H" designate the vertical and horizontal planes intersecting both the headlamp light source and the photometer axis. "H-V" designates the zero test point angle at the intersection of the H and V planes. This intersection is parallel to the longitudinal axis of the vehicle.

S14.2.5.8.1.2 The letters "U", "D", "L", and "R", indicating up, down, left and right, respectively, designate the angular position from the H and V planes to the photometer as viewed from the headlamp.

S14.2.5.8.1.3 Horizontal angles designated L and R are defined as the plan view angle between the vertical plane and the projection of the light ray from the headlamp onto the horizontal plane.

S14.2.5.8.1.4 Vertical angles designated U and D are defined as the true angle between the horizontal plane and the light ray from the headlamp.

S14.2.5.9 *Beam contributor photometry measurements.* In a headlighting system where there is more than one beam contributor providing a lower beam, and/or more than one beam contributor providing an upper beam, each beam contributor must be designed to meet only the applicable photometric performance requirements based upon the following mathematical expression: conforming test point value = $2(\text{test point value})/\text{total number of lower or upper beam contributors for the vehicle, as appropriate}$.

S14.2.5.10 *Moveable reflector aimed headlamp photometry measurements.*

Regulations

S14.2.5.10.1 A headlamp aimed by moving the reflector relative to the lens and headlamp housing, or vice versa, must conform to the photometry requirements applicable to it with the lens at any position relative to the reflector.

S14.2.5.10.2 These positions include not less than the full range of vertical pitch of the vehicle on which the headlamp is installed and not less than $\pm 2.5^\circ$ from the nominal horizontal aim position for the vehicle on which the headlamp is installed unless the headlamp is visually/optically aimed with a fixed horizontal aim.

S14.3 *Motorcycle headlamp out of focus test procedure and performance requirements.*

S14.3.1 *Procedure.* The sample device must be tested for photometry using bulbs having each of four out-of-focus filament positions. Where conventional bulbs with two pin bayonet bases are used, tests must be made with the light source 0.060 in. above, below, ahead, and behind the designated position. If prefocused bulbs are used, the limiting positions at which tests are made must be 0.020 in. above, below, ahead, and behind the designated position. The sample device may be reaimed for each of the out-of-focus positions of the light source.

S14.3.2 *Performance requirements.* The minimum photometric values for the out-of-design position must be 80% of the in-design position.

S14.4 *General test procedures and performance requirements.*

S14.4.1 *Color test.* The requirement applies to the overall effective color of light emitted by the device and not to the color of the light from a small area of the lens. It does not apply to any pilot, indicator, or tell-tale lights. The color of the sample device must comply when tested by either the Visual Method or the Tristimulus Method.

S14.4.1.1 *Samples.* A test sample for a reflex reflector may be either the reflex reflector or a disc of the same material, technique of fabrication, and dye formulation as the reflex reflector. If a disc is used, the thickness must be twice the thickness of the reflector as measured from the face of the lens to the apexes of the reflecting elements.

S14.4.1.2 *General procedure.*

S14.4.1.2.1 The device must be operated at design voltage.

S14.4.1.2.2 Components (bulbs, caps, lenses, and the like) must be tested in a fixture or manner simulating the intended application.

S14.4.1.2.3 The lamp shall be allowed to reach operating temperature before measurements are made.

S14.4.1.2.4 The entire light emitting surface of the sample must be visible from any point on the entrance window of the test instrument.

S14.4.1.2.5 The distance between the test instrument and the sample must be large enough so that further increases in distance will not affect the results.

S14.4.1.3 *Visual method.*

S14.4.1.3.1 *Visual method procedure.* The color of light from the sample device must be compared visually with the color of the light from a standard. The stan-

dard may consist of a filter or limit glass. In the case of white, CIE Source A is used only as a color reference. The chromaticity coordinates of the color standards must be as close as possible to the limits listed. The color of the standard filters is determined spectrophotometrically.

S14.4.1.3.2 *Visual method performance requirements.* The color must comply with the applicable requirement.

S14.4.1.3.2.1 *Red.* Red is not acceptable if it is less saturated (paler), yellower, or bluer than the limit standards.

S14.4.1.3.2.2 *Yellow (Amber).* Yellow is not acceptable if it is less saturated (paler), greener, or redder than the limit standards.

S14.4.1.3.2.3 *White.* White is not acceptable if its color differs materially from that of CIE Source A.

S14.4.1.3.2.4 *Green.* Green is not acceptable if it is less saturated (paler), yellower, or bluer than the limit standards.

S14.4.1.3.2.5 *Blue.* Blue is not acceptable if it is less saturated (paler), greener, or redder than the limit standards.

S14.4.1.4 *Tristimulus method.*

S14.4.1.4.1 *Tristimulus method procedure.*

S14.4.1.4.1.1 The color of light from the H-V point of a sample device must be measured by photoelectric receivers with spectral responses that approximate CIE standard spectral tristimulus valves.

S14.4.1.4.1.2 A sphere may be used to integrate light from a colored source provided that the color shift that results from the spectral selectivity of the sphere paint be corrected by the use of a filter, correction factor, or an appropriate calibration.

S14.4.1.4.1.3 Where the sample device does not have uniform spectral characteristics in all useful directions, color measurements must be made at as many directions of view as are required to evaluate the color for those directions that apply to the end use of the device.

S14.4.1.4.2 *Tristimulus method performance requirements.* The color must comply with the applicable requirement.

S14.4.1.4.2.1 *Red.* The color of light emitted must fall within the following boundaries:

$y = 0.33$ (yellow boundary)

$y = 0.98 - x$ (purple boundary)

S14.4.1.4.2.2 *Yellow (Amber).* The color of light emitted must fall within the following boundaries:

$y = 0.39$ (red boundary)

$y = 0.79 - 0.67x$ (white boundary)

$y = x - 0.12$ (green boundary)

S14.4.1.4.2.3 *White (achromatic).* The color of light emitted must fall within the following boundaries:

$x = 0.31$ (blue boundary)

$y = 0.44$ (green boundary)

$x = 0.50$ (yellow boundary)

$y = 0.15 + 0.64x$ (green boundary)

$y = 0.38$ (red boundary)

$y = 0.05 + 0.75x$ (purple boundary)

Vehicle Maintenance Pro

S14.4.1.4.2.4 *Green*. The color of light emitted must fall within the following boundaries:

$y = 0.73 - 0.73x$ (yellow boundary)

$x = 0.63y - 0.04$ (white boundary)

$y = 0.50 - 0.50x$ (blue boundary)

S14.4.1.4.2.5 *Restricted Blue*. The color of light emitted must fall within the following boundaries:

$y = 0.07 + 0.81x$ (green boundary)

$x = 0.40 - y$ (white boundary)

$y = 0.13 + 0.60y$ (violet boundary)

S14.4.1.4.2.6 *Signal Blue*. The color of light emitted must fall within the following boundaries:

$y = 0.32$ (green boundary)

$x = 0.16$ (white boundary)

$x = 0.40 - y$ (white boundary)

$x = 0.13 + 0.60y$ (violet boundary)

S14.4.2 *Plastic optical materials tests*. Accelerated weathering procedures are not permitted.

S14.4.2.1 *Samples*.

S14.4.2.1.1 Samples of materials shall be injection molded into polished metal molds to produce test specimens with two flat and parallel faces. Alternative techniques may be used to produce equivalent specimens.

S14.4.2.1.2 Test specimens shape may vary, but each exposed surface must contain a minimum uninterrupted area of 32 sq cm.

S14.4.2.1.3 Samples must be furnished in thicknesses of 1.6 ± 0.25 mm, 2.3 ± 0.25 mm, 3.2 ± 0.25 mm, and 6.4 ± 0.25 mm.

S14.4.2.1.4 All samples must conform to the applicable color test requirement of this standard prior to testing.

S14.4.2.1.5 A control sample, kept properly protected from influences which may change its appearance and properties of each thickness, must be retained.

S14.4.2.2 *Outdoor exposure test*.

S14.4.2.2.1 Outdoor exposure tests of 3 years in duration must be made on samples of all materials, including coated and uncoated versions, used for optical parts of devices covered by this standard. Tests are to be conducted in Florida and Arizona.

S14.4.2.2.2 Concentrations of polymer components and additives used in plastic materials may be changed without outdoor exposure testing provided the changes are within the limits of composition represented by higher and lower concentrations of these polymer components and additives previously tested to this section and found to meet its requirements.

S14.4.2.2.3 *Procedure*.

S14.4.2.2.3.1 One sample of each thickness of each material must be mounted at each exposure site so that at least a minimum uninterrupted area of 32 sq cm of the exposed upper surface of the sample is at an angle of 45° to the horizontal facing south. The sample must be mounted in the open no closer than 30 cm (11.8 in) to its background.

S14.4.2.2.3.2 During the exposure time the samples must be cleaned once every three months by washing

with mild soap or detergent and water, and then rinsing with distilled water. Rubbing must be avoided.

S14.4.2.2.4 *Performance requirements*. Plastic lenses, other than those incorporating reflex reflectors, used for inner lenses or those covered by another material and not exposed directly to sunlight must meet the optical material test requirements when covered by the outer lens or other material.

S14.4.2.2.4.1 After completion of the outdoor exposure test the haze and loss of surface luster as measured by ASTM D1003-92 (incorporated by reference, see §571.5) must not be greater than:

(a) 30% for materials used for outer lenses, other than those incorporating reflex reflectors;

(b) 7% for materials used for reflex reflectors and lenses used in front of reflex reflectors.

S14.4.2.2.4.2 After completion of the outdoor exposure test materials used for headlamp lenses must show no deterioration.

S14.4.2.2.4.3 After completion of the outdoor exposure test all materials, when compared with the unexposed control samples, must not show physical changes affecting performance such as color bleeding, delamination, crazing, or cracking. Additionally materials used for reflex reflectors and lenses used in front of reflex reflectors must not show surface deterioration or dimensional changes.

S14.4.2.2.4.4 After completion of the outdoor exposure test all materials, when compared with the unexposed control samples, must not have their luminous transmittance changed by more than 25% when tested in accordance with ASTM E308-66 (incorporated by reference, see §571.5) using CIE Illuminant A (2856K).

S14.4.2.2.4.5 After completion of the outdoor exposure test all materials must conform to the color test of this standard in the range of thickness stated by the material manufacturer.

S14.4.2.3 *Heat test*.

S14.4.2.3.1 *Procedure*. Two samples of each thickness of each material must be supported at the bottom, with at least 51 mm of the sample above the support, in the vertical position in such a manner that, on each side, the minimum uninterrupted area of exposed surface is not less than 3225 sq mm. The samples are placed in a circulating air oven at $79 \pm 3^\circ\text{C}$ for two hours.

S14.4.2.3.2 *Performance requirements*. After completion of the heat exposure and cooling to room ambient temperature, a test specimen must show no change in shape and general appearance discernable to the naked eye when compared with an unexposed specimen and continue to conform to the applicable color test requirement of this standard.

S14.5 *Signal lamp and reflective device physical test procedures and performance requirements*.

S14.5.1 *Vibration test*.

S14.5.1.1 *Procedure*. The sample device, as mounted on the support supplied, must be bolted to the anvil end of the table of the vibration test machine of Figure 21 and vibrated approximately 750 cpm through a distance of $\frac{1}{8}$ in. The table must be spring mounted at one end

Regulations

and fitted with steel calks on the underside of the other end. The calks are to make contact with the steel anvil once during each cycle at the completion of the fall. The rack must be operated under a spring tension of 60 to 70 lb. The test must be continued for 1 hour.

S14.5.1.2 Performance requirements. After completion of the vibration test a device showing evidence of material physical weakness, lens or reflector rotation, displacement or rupture of parts except bulb failures, must be considered to have failed, providing that the rotation of lens or reflector must not be considered as a failure when tests show compliance with specifications despite such rotation.

S14.5.2 Moisture test.

S14.5.2.1 Procedure. The sample device must be mounted in its normal operating position with all drain holes open and subjected to a precipitation of 0.1 in of water per minute, delivered at an angle of 45° from a nozzle with a solid cone spray. During the test the device must revolve about its vertical axis at a rate of 4 rpm for a period of 12 hours followed by a one hour drain period where the device does not rotate and the spray stops. After completion of the moisture test the device must be examined for moisture accumulation.

S14.5.2.2 Performance requirements. Accumulation of moisture in excess of 2 cc or any visible moisture in a sealed reflex unit must constitute a failure.

S14.5.3 Dust test.

S14.5.3.1 Samples. A sealed unit is not required to meet the requirements of this test.

S14.5.3.2 Procedure. The sample device with any drain hole closed must be mounted in its normal operating position, at least 6 in from the wall in a cubical box with inside measurements of 3 ft on each side containing 10 lb of fine powered cement in accordance with ASTM C150-56 (incorporated by reference, see §571.5). At intervals of 15 minutes during a test period of 5 hours, the dust must be agitated by compressed air or fan blower by projecting blasts of air for a 2 second period in a downward direction into the dust in such a way that the dust is completely and uniformly diffused throughout the entire cube and allowed to settle. After the completion of the dust test the exterior surface of the device must be cleaned.

S14.5.3.3 Performance requirements. If after a photometry test the maximum photometric intensity of the device is not more than 10% less than the maximum photometric intensity of the same device after being cleaned both inside and outside, the device is considered to have met the requirements of the dust test.

S14.5.4 Corrosion test.

S14.5.4.1 Procedure. The sample device must be subjected to a salt spray (fog) test in accordance with the latest version of ASTM B117-73 (Reapproved 1979) (incorporated by reference, see §571.5), for a period of 50 hours, consisting of two periods of 24 hour exposure followed by a 1 hr drying time.

S14.5.4.2 Performance requirements. After the completion of the corrosion test there must be no evidence of excessive corrosion which would affect the proper function of the device.

S14.6 Headlamp physical test procedures and performance requirements.

S14.6.1 Abrasion test.

S14.6.1.1 Procedure.

S14.6.1.1.1 Abrading pad. A new, unused abrading pad constructed of 0000 steel wool not less than 2.5 ± 1 cm wide, rubber cemented to a rigid base shaped to the same vertical contour of the lens, is used for each test. The abrading pad support is equal in size to the pad and the center of the support surface is within ± 2 mm of parallel to the lens surface. The "grain" of the pad is oriented perpendicular to the direction of motion. The density of the pad is such that when the pad is resting unweighted on the lens, the base of the pad is no closer than 3.2 mm to the lens at its closest point.

S14.6.1.1.2 Abrading pad alignment. A sample headlamp is mounted in the abrasion test fixture of Figure 5 with the lens facing upward. When mounted on its support and resting on the lens of the test headlamp, the abrading pad is then weighted such that a pad pressure of 14 ± 1 KPa. exists at the center and perpendicular to the face of the lens.

S14.6.1.1.3 Abrasion test procedure. The pad is cycled back and forth (1 cycle) for 11 cycles at 4 ± 0.8 in (10 ± 2 cm) per second over at least 80% of the lens surface, including all the area between the upper and lower aiming pads, but not including lens trim rings and edges. A pivot must be used if it is required to follow the contour of the lens.

S14.6.1.2 Performance requirements. After completion of the abrasion test the sample headlamp must meet the requirements of the applicable photometry tests of Table XIX and Table XVIII. A $\frac{1}{4}^\circ$ reaim is permitted in any direction at any test point.

S14.6.2 Chemical resistance test.

S14.6.2.1 Procedure.

S14.6.2.1.1 Test fluids. The five test fluids used in the chemical resistance test include:

(a) ASTM Reference Fuel C, which is composed of Isooctane 50% volume and Toluene 50% volume. Isooctane must conform to A2.7 in the ASTM Motor Fuels section (incorporated by reference, see §571.5), and Toluene must conform to ASTM D362-84 (incorporated by reference, see §571.5). ASTM Reference Fuel C must be used as specified in: Paragraph A2.3.2 and A2.3.3 of the ASTM Motor Fuels section (incorporated by reference, see §571.5); and OSHA Standard 29 CFR 1910.106—Handling Storage and Use of Flammable Combustible Liquids;

(b) Tar remover (consisting by volume of 45% xylene and 55% petroleum base mineral spirits);

(c) Power steering fluid (as specified by the vehicle manufacturer for use in the motor vehicle on which the headlamp is intended to be installed);

(d) Windshield washer fluid consisting of 0.5% monoethanolamine with the remainder 50% concentration of methanol/distilled water by volume; and

(e) Antifreeze (50% concentration of ethylene glycol/distilled water by volume).

Vehicle Maintenance Pro

S14.6.2.1.2 Fluid application. The entire exterior lens surface of the sample headlamp mounted in the headlamp test fixture and top surface of the lens-reflector joint is wiped once to the left and once to the right with a 6 inch square soft cotton cloth (with pressure equally applied) which has been saturated once in a container with 2 ounces of five different test fluids listed above. The lamp is wiped within 5 seconds after removal of the cloth from the test fluid. A new lamp sample may be used with each fluid.

S14.6.2.1.3 Test duration. After the headlamp sample has been wiped with the test fluid, it must be stored in its designed operating attitude for 48 hours at a temperature of $23^{\circ}\text{C} \pm 4^{\circ}\text{C}$ and a relative humidity of $30\% \pm 10\%$. At the end of the 48-hour period, the headlamp is wiped clean with a soft dry cotton cloth and visually inspected.

S14.6.2.2 Performance requirements. After completion of the chemical resistance test, the sample headlamp must have no surface deterioration, coating delamination, fractures, deterioration of bonding or sealing materials, color bleeding, or color pickup visible without magnification and the headlamp must meet the requirements of the applicable photometry tests of Table XIX and Table XVIII. A $\frac{1}{4}^{\circ}$ reaim is permitted in any direction at any test point.

S14.6.3 Corrosion test.

S14.6.3.1 Procedure. A sample headlamp, mounted on a headlamp test fixture in designed operating position and including all accessory equipment necessary to operate in its normal manner, is subjected to a salt spray (fog) test in accordance with ASTM B117-73 (incorporated by reference, see §571.5), for 50 total hours, consisting of two periods of 24 hours exposure followed by a 1 hour drying period. If a portion of the device is completely protected in service, that portion is covered to prevent salt fog entry during exposure. After removal from the salt spray and the final 1 hour drying period the sample headlamp is examined for corrosion that affects any other applicable tests contained in S14.6. If such corrosion is found, the affected test(s) must be performed on the corrosion sample and the results recorded.

S14.6.3.2 Performance requirements. After completion of the corrosion test, the sample headlamp must not have any observed corrosion which would result in the failure of any other applicable tests contained in S14.6 and no corrosion of the headlamp mounting and aiming mechanism that would result in the failure of the aiming adjustment tests, inward force test, or torque deflection test of S14.6.

S14.6.4 Corrosion-connector test.

S14.6.4.1 Procedure.

S14.6.4.1.1 A headlamp connector test must be performed on each filament circuit of the sample headlamp prior to the test in S14.6.4.1.2 according to Figure 4 and S14.6.15. The power source is set to provide 12.8 volts and the resistance must be set to produce 10 amperes.

S14.6.4.1.2 The headlamp, with connector attached to the terminals, unfixed and in its designed operating attitude with all drain holes, breathing devices or other

designed openings in their normal operating positions, is subjected to a salt spray (fog) test in accordance with ASTM B117-73 (incorporated by reference, see §571.5), for 240 hours, consisting of ten successive 24-hour periods.

S14.6.4.1.3 During each period, the headlamp is mounted in the middle of the chamber and exposed for 23 hours to the salt spray. The spray is not activated during the 24th hour. The bulb is removed from the headlamp and from the test chamber during the one hour of salt spray deactivation and reinserted for the start of the next test period, at the end of the first and last three 23-hour periods of salt spray exposure, and at the end of any two of the fourth through seventh 23-hour periods of salt-spray exposure.

S14.6.4.1.4 The test chamber is closed at all times except for a maximum of 2 minutes which is allowed for removal or replacement of a bulb during each period.

S14.6.4.1.5 After the ten periods, the lens-reflector unit without the bulb must be immersed in deionized water for 5 minutes, then secured and allowed to dry by natural convection only.

S14.6.4.1.6 Using the voltage, resistance and pre-test set up of S14.6.4.1.1 the current in each filament circuit must be measured after the test conducted in S14.6.4.1.2.

S14.6.4.2 Performance requirements.

S14.6.4.2.1 After the completion of the corrosion-connector test, the sample headlamp must show no evidence of external or internal corrosion or rust visible without magnification.

S14.6.4.2.2 Loss of adhesion of any applied coating must not occur more than 3.2 mm from any sharp edge on the inside or out.

S14.6.4.2.3 Corrosion may occur on terminals only if the test current produced during the test of S14.6.4.1.6 is not less than 9.7 amperes.

S14.6.5 Dust test.

S14.6.5.1 Procedure.

S14.6.5.1.1 A sample headlamp, mounted on a headlamp test fixture, with all drain holes, breathing devices or other designed openings in their normal operating positions, is positioned within a cubical box, with inside measurements of 900 mm on each side or larger if required for adequate wall clearance (*i.e.*, a distance of at least 150 mm between the headlamp and any wall of the box).

S14.6.5.1.2 The box contains 4.5 kg of fine powdered cement which conforms to the ASTM C150-77 (incorporated by reference, see §571.5). Every 15 minutes, the cement is agitated by compressed air or fan blower(s) by projecting blasts of air for a two-second period in a downward direction so that the cement is diffused as uniformly as possible throughout the entire box.

S14.6.5.1.3 This test is continued for five hours after which the exterior surfaces of the headlamp are wiped clean.

S14.6.5.2 Performance requirements. After completion of the dust test, the sample headlamp must meet the requirements of the applicable photometry tests of

Regulations

Table XIX and Table XVIII. A $\frac{1}{4}^\circ$ reaim is permitted in any direction at any test point.

S14.6.6 *Temperature cycle test and internal heat test.*

S14.6.6.1 *Samples.* A sample headlamp with one or more replaceable light sources is tested according to the procedures of this section for a temperature cycle test and an internal heat test. The same sample headlamp is used in the temperature cycle test and then in the internal heat test.

S14.6.6.2 *General procedure.*

S14.6.6.2.1 Tests are made with all filaments lighted at design voltage that are intended to be used simultaneously in the headlamp and which in combination draw the highest total wattage. These include but are not limited to filaments used for turn signal lamps, fog lamps, parking lamps, and headlamp lower beams lighted with upper beams when the wiring harness is so connected on the vehicle.

S14.6.6.2.2 If a turn signal is included in the headlamp assembly, it is operated at 90 flashes a minute with a $75\% \pm 2\%$ current "on time."

S14.6.6.2.3 If the lamp produces both the upper and lower beam, it is tested in both the upper beam mode and the lower beam mode under the conditions above described, except for a headlamp with a single type HB1 or type HB2 light source.

S14.6.6.3 *Temperature cycle test.*

S14.6.6.3.1 *Procedure.*

S14.6.6.3.1.1 A sample headlamp, mounted on a headlamp test fixture, is subjected to 10 complete consecutive cycles having the thermal cycle profile shown in Figure 6.

S14.6.6.3.1.2 During the hot cycle, the lamp, is energized commencing at point "A" of Figure 6 and de-energized at point "B."

S14.6.6.3.1.3 Separate or single test chambers may be used to generate the environment of Figure 6.

S14.6.6.3.1.4 All drain holes, breathing devices or other openings or vents of the headlamps are set in their normal operating positions.

S14.6.6.3.2 *Performance requirements.* After completion of the temperature cycle test, the sample headlamp must:

(a) show no evidence of delamination, fractures, entry of moisture, or deterioration of bonding material, color bleeding, warp or deformation visible without magnification;

(b) show no lens warpage greater than 3 mm when measured parallel to the optical axis at the point of intersection of the axis of each light source with the exterior surface of the lens; and

(c) meet the requirements of the applicable photometry tests of Table XIX and Table XVIII. A $\frac{1}{4}^\circ$ reaim is permitted in any direction at any test point.

S14.6.6.4 *Internal heat test.*

S14.6.6.4.1 *Procedure.*

S14.6.6.4.1.1 A sample headlamp lens surface that would normally be exposed to road dirt is uniformly sprayed with any appropriate mixture of dust and wa-

ter or other materials to reduce the photometric output at the H-V test point of the upper beam (or the $\frac{1}{2}^\circ$ D-1 $\frac{1}{2}^\circ$ R test point of the lower beam as applicable) to $25\% \pm 2\%$ of the output originally measured in the applicable photometric compliance test.

S14.6.6.4.1.2 A headlamp with a single type HB1 or type HB2 light source is tested on the upper beam only.

S14.6.6.4.1.3 Such reduction is determined under the same conditions as that of the original photometric measurement.

S14.6.6.4.1.4 After the photometric output of the lamp has been reduced as specified above, the sample lamp and its mounting hardware must be mounted in an environmental chamber in a manner similar to that indicated in Figure 7 "Dirt/Ambient Test Setup."

S14.6.6.4.1.5 The headlamp is soaked for one hour at a temperature of $35^\circ + 4^\circ - 0^\circ \text{C}$ and then the lamp is energized according to the procedure of this section for one hour in a still air condition, allowing the temperature to rise from the soak temperature.

S14.6.6.4.1.6 At the end of one hour the sample lamp is returned to a room ambient temperature of $23^\circ + 4^\circ - 0^\circ \text{C}$ and a relative humidity of $30\% \pm 10\%$ and allowed to stabilize to the room ambient temperature. The lens is then cleaned.

S14.6.6.4.2 *Performance requirements.* After completion of the temperature cycle test and meeting its requirements, and completion of the internal heat test, the sample headlamp must:

(a) have no lens warpage greater than 3 mm when measured parallel to the optical axis at the point of intersection of the axis of each light source with the exterior surface of the lens, and

(b) meet the requirements of the applicable photometry tests of Table XIX and Table XVIII. A $\frac{1}{4}^\circ$ reaim is permitted in any direction at any test point.

S14.6.7 *Humidity test.*

S14.6.7.1 *Procedure.*

S14.6.7.1.1 The test fixture consists of a horizontal steel plate to which three threaded steel or aluminum rods of $\frac{1}{2}$ inch diameter are screwed vertically behind the headlamp.

S14.6.7.1.2 The sample headlamp assembly is clamped to the vertical rods, which are behind the headlamp. All attachments to the headlamp assembly are made behind the lens and vents or openings, and are not within 2 inches laterally of a vent inlet or outlet.

S14.6.7.1.3 The mounted headlamp assembly is oriented in its design operating position, and is placed in a controlled environment at a temperature of $100^\circ + 7^\circ - 0^\circ \text{F}$ ($38^\circ + 4^\circ - 0^\circ \text{C}$) with a relative humidity of not less than 90%. All drain holes, breathing devices, and other openings are set in their normal operation positions for all phases of the humidity test.

S14.6.7.1.4 The headlamp is subjected to 24 consecutive 3-hour test cycles. In each cycle, the headlamp is energized for 1 hour at design voltage with the highest combination of filament wattages that are intended to be used, and then de-energized for 2 hours. If the headlamp incorporates a turn signal then the turn signal

Vehicle Maintenance Pro

flashes at 90 flashes per minute with a $75\% \pm 2\%$ current “on-time.”

S14.6.7.1.5 Within 3 minutes after the completion of the 24th cycle, the air flow test will begin. The following procedure shall occur: the mounted assembly is removed, placed in an insulating box and covered with foam material so that there is no visible air space around the assembly; the box is closed, taken to the air flow test chamber, and placed within it. Inside the chamber, the assembly with respect to the air flow, is oriented in its design operating position. The assembly is positioned in the chamber so that the center of the lens is in the center of the opening of the air flow entry duct during the test. The headlamp has at least 3 inches clearance on all sides, and at least 4 inches to the entry and exit ducts at the closest points. If vent tubes are used which extend below the lamp body, the 3 inches are measured from the bottom of the vent tube or its protection. The temperature of the chamber is $73^\circ + 7^\circ - 0^\circ\text{F}$ ($23^\circ + 4^\circ - 0^\circ\text{C}$) with a relative humidity of $30\% + 10\% - 0\%$. The headlamp is not energized.

S14.6.7.1.6 Before the test specified in paragraph S14.6.7.1.7 of this section, the uniformity of the air flow in the empty test chamber at a plane 4 inches downstream of the air entry duct is measured over a 4 inch square grid. The uniformity of air flow at each grid point is $\pm 10\%$ of the average air flow specified in paragraph S14.6.7.1.7 of this section.

S14.6.7.1.7 The mounted assembly in the chamber is exposed, for one hour, to an average air flow of $330 + 0 - 30$ ft/min as measured with an air velocity measuring probe having an accuracy of $\pm 3\%$ in the 330 ft/min range. The average air flow is the average of the velocity recorded at six points around the perimeter of the lens. The six points are determined as follows: At the center of the lens, construct a horizontal plane. The first two points are located in the plane, 1 inch outward from the intersection of the plane and each edge of the lens. Then, trisect the distance between these two points and construct longitudinal vertical planes at the two intermediate locations formed by the trisection. The four remaining points are located in the vertical planes, one inch above the top edge of the lens, and one inch below the bottom edge of the lens.

S14.6.7.1.8 After one hour, the headlamp is removed and inspected for moisture.

S14.6.7.2 *Performance requirements.* After completion of the humidity test, the sample headlamp must show no evidence of interior delamination or moisture, fogging or condensation visible without magnification.

S14.6.8 *Vibration test.*

S14.6.8.1 *Samples.* The mounting bracket with a sample headlamp installed must not have a resonant frequency in the 10-55 Hz. range.

S14.6.8.2 *Procedure.* The mounted sample headlamp is bolted to the anvil end of the table of the vibration test machine of Figure 21 and vibrated 750 cpm through a distance of $\frac{1}{8}$ in. The table is spring mounted at one end and fitted with steel calks on the underside of the other end. The table is of sufficient size to completely contain the test fixture base with no overhang. The

calks are to make contact with the steel anvil once during each cycle at the completion of the fall. The rack is operated under a spring tension of 60 to 70 lb. The vibration is applied in the vertical axis of the headlamp as mounted on the vehicle. Bulb filaments are not energized during the test. The test is continued for 1 hour.

S14.6.8.3 *Performance requirements.* After completion of the vibration test, there must be no evidence of loose or broken parts, other than filaments, visible without magnification.

S14.6.9 *Sealing test.*

S14.6.9.1 *Procedure.*

S14.6.9.1.1 An unfixtured sample headlamp in its design mounting position is placed in water at a temperature of $176^\circ \pm 5^\circ\text{F}$ ($80^\circ \pm 3^\circ\text{C}$) for one hour. The headlamp is energized in its highest wattage mode, with the test voltage at $12.8 \pm 0.1\text{ V}$ during immersion.

S14.6.9.1.2 The lamp is then de-energized and immediately submerged in its design mounting position into water at $32^\circ + 5^\circ - 0^\circ\text{F}$ ($0^\circ + 3^\circ - 0^\circ\text{C}$). The water is in a pressurized vessel, and the pressure is increased to 10 psi (70 kPa), upon placing the lamp in the water. The lamp must remain in the pressurized vessel for a period of thirty minutes.

S14.6.9.1.3 This entire procedure is repeated for four cycles.

S14.6.9.1.4 Then the lamp is inspected for any signs of water on its interior. During the high temperature portion of the cycles, the lamp is observed for signs of air escaping from its interior.

S14.6.9.2 *Performance requirements.* After completion of the sealing test, a sample headlamp confirmed to be sealed need not meet the corrosion test, dust test, or humidity test of this Section. If any water is on the interior or air escapes, the lamp is not a sealed lamp.

S14.6.10 *Chemical resistance test of reflectors of replaceable lens headlamps test.*

S14.6.10.1 *Procedure.*

S14.6.10.1.1 *Test fluids.* The three test fluids used in the chemical resistance test include;

- (a) Tar remover (consisting by volume of 45% xylene and 55% petroleum base mineral spirits);
- (b) Mineral spirits; and
- (c) Fluids other than water contained in the manufacturer's instructions for cleaning the reflector.

S14.6.10.1.2 *Fluid application.* With a sample headlamp in the headlamp test fixture and the lens removed, the entire surface of the reflector that receives light from a headlamp light source is wiped once to the left and once to the right with a 6-inch square soft cotton cloth (with pressure equally applied) which has been saturated once in a container with 2 ounces of one of the test fluids listed in S14.6.10.1.1. The lamp is wiped within 5 seconds after removal of the cloth from the test fluid.

S14.6.10.1.3 *Test duration.* After the headlamp has been wiped with the test fluid, it is stored in its designed operating attitude for 48 hours at a temperature of $73^\circ \pm 7^\circ\text{F}$ ($23^\circ \pm 4^\circ\text{C}$) and a relative humidity of $30\% \pm 10\%$. At the end of the 48-hour period, the headlamp is

Regulations

wiped clean with a soft dry cotton cloth and visually inspected.

S14.6.10.2 Performance requirements. After completion of the chemical resistance test, the sample headlamp must have no surface deterioration, coating delamination, fractures, deterioration of bonding or sealing materials, color bleeding or color pickup visible without magnification and the headlamp must meet the requirements of the applicable photometry tests of Table XIX and Table XVIII. A $\frac{1}{4}^\circ$ re-aim is permitted in any direction at any test point.

S14.6.11 Corrosion resistance test of reflectors of replaceable lens headlamps test.

S14.6.11.1 Procedure.

S14.6.11.1.1 A sample headlamp with the lens removed, unfixtured and in its designed operating attitude with all drain holes, breathing devices or other designed openings in their normal operating positions, must be subjected to a salt spray (fog) test in accordance with ASTM B117-73, *Method of Salt Spray (Fog) Testing* (incorporated by reference, see 571.108 S5.2 of this title), for 24 hours, while mounted in the middle of the chamber.

S14.6.11.1.2 Afterwards, the headlamp must be stored in its designed operating attitude for 48 hours at a temperature of $73^\circ \pm 7^\circ\text{F}$ ($23^\circ \pm 4^\circ\text{C}$) and a relative humidity of $30\% \pm 10\%$ and allowed to dry by natural convection only. At the end of the 48-hour period, the reflector must be cleaned according to the instructions supplied with the headlamp manufacturer's replacement lens, and inspected. The lens and seal must then be attached according to these instructions and the headlamp tested for photometric performance.

S14.6.11.2 Performance requirements. After the completion of the corrosion test, the sample headlamp must show no evidence of corrosion or rust visible without magnification on any part of the headlamp reflector that receives light from a headlamp light source, on any metal light or heat shield assembly, or on a metal reflector of any other lamp. The sample headlamp with the replacement lens installed must meet the requirements of the applicable photometry tests of Table XIX and Table XVIII. A $\frac{1}{4}^\circ$ re-aim is permitted in any direction at any test point.

S14.6.12 Inward force test.

S14.6.12.1 Procedure. A sample headlamp mechanism, including the aiming adjusters, must be subjected to an inward force of 222 N directed normal to the headlamp aiming plane and symmetrically about the center of the headlamp lens face.

S14.6.12.2 Performance requirements. After the completion of the inward force test, a sample headlamp must not permanently recede by more than 2.5 mm. The aim of the headlamp must not permanently deviate by more than 3.2 mm at a distance of 7.6 m. The aim of any headlamp that is capable of being mechanically aimed by externally applied aiming devices must not change by more than 0.30° .

S14.6.13 Torque deflection test.

S14.6.13.1 Procedure.

S14.6.13.1.1 The sample headlamp assembly is mounted in designed vehicle position and set at nominal aim ($H=0$, $V=0$).

S14.6.13.1.2 A sealed beam headlamp, except Type G and Type H, is removed from its mounting and replaced by the applicable deflectometer. (Type C and Type D-Figure 18, Type A and Type E-Figure 16, Type B-Figure 17, and Type F-Figure 14).

S14.6.13.1.3 Sealed beam headlamps Type G and Type H have the adapter of Figure 15 and the deflectometer of Figure 14 attached to the headlamp.

S14.6.13.1.4 A torque of 2.25 Nm must be applied to the headlamp assembly through the deflectometer and a reading on the thumbwheel is taken. The torque must be removed and a second reading on the thumbwheel is taken.

S14.6.13.1.5 Headlamps other than sealed beam headlamps must have the downward force used to create the torque applied parallel to the aiming reference plane, through the aiming pads, and displaced forward using a lever arm such that the force is applied on an axis that is perpendicular to the aiming reference plane and originates at the center of the aiming pad pattern (see Figure 3).

S14.6.13.1.6 For headlamps using the aiming pad locations of Group I, the distance between the point of application of force and the aiming reference plane is not less than 168.3 mm plus the distance from the aiming reference plane to the secondary plane, if used.

S14.6.13.1.7 For headlamps using the aiming pad locations of Group II, the distance between the point of application of force and the aiming reference plane is not less than 167.9 mm plus the distance to the secondary plane, if used.

S14.6.13.1.8 For headlamps using the nonadjustable Headlamp Aiming Device Locating Plates for the 146 mm diameter, the 176 mm diameter, and the 92x150 mm sealed beam, the distance between the point of application of force and the aiming plane is not, respectively, less than 177.4 mm, 176.2 mm, and 193.7 mm.

S14.6.13.2 Performance requirements. The aim of each sample headlamp must not deviate more than 0.30° when the downward torque is removed.

S14.6.14 Retaining ring test.

S14.6.14.1 Procedure. A sample headlamp with the minimum flange thickness of: Type A-31.5 mm, Type B-10.1 mm, Type C-11.8 mm, Type D-11.8 mm, Type E-31.5 mm, and Type F-8.6 mm, is secured between the appropriate mounting ring and retaining ring (mounting ring and aiming ring for Type F).

S14.6.14.2 Performance requirements. The sample headlamp when secured per the procedure must be held tight enough that it will not rattle.

S14.6.15 Headlamp connector test.

S14.6.15.1 Procedure. A sample headlamp connected into the test circuit of Figure 4 has the power supply adjusted until 10 amperes DC are flowing through the circuit. The test is repeated for each filament circuit of the headlamp.

Vehicle Maintenance Pro

S14.6.15.2 *Performance requirements.* The voltage drop, as measured in the test circuit of Figure 4, must not exceed 40 mv DC in any applicable filament circuit of the sample headlamp.

S14.6.16 *Headlamp wattage test.*

S14.6.16.1 *Procedure.* A sample headlamp that has been seasoned is energized so as to have $12.8\text{v} \pm 20\text{ mv}$ DC applied across each filament circuit and the current flowing in each circuit is measured.

S14.6.16.2 *Performance requirements.* The wattage of each filament circuit of the sample headlamp must not exceed the applicable value for that type of headlamp as shown in Table II.

S14.6.17 *Aiming adjustment test-laboratory.*

S14.6.17.1 *Procedure.* A sample headlamp is mounted in design position at nominal ($H = 0$, $V = 0$) aim with an accurate measuring device such as a spot projector or other equally accurate means attached. The headlamp is adjusted to the extremes of travel in each horizontal and vertical direction.

S14.6.17.2 *Performance requirements.* Visually aimed lower beam headlamps without a VHAD are required not to have a horizontal adjustment mechanism and horizontal aim range requirements do not apply.

S14.6.17.2.1 A sample sealed beam headlamp, other than a Type F, tested per the procedure must provide a minimum of $\pm 4.0^\circ$ adjustment range in both the vertical and horizontal planes and if equipped with independent vertical and horizontal aiming screws, the adjustment must be such that neither the vertical nor horizontal aim must deviate more than 100 mm from horizontal or vertical planes, respectively, at a distance of 7.6 m through an angle of $\pm 4.0^\circ$.

S14.6.17.2.2 A sample Type F sealed beam, integral beam, replaceable bulb, or combination headlamp tested per the procedure must provide a minimum of $\pm 4.0^\circ$ adjustment range in the vertical plane and $\pm 2.5^\circ$ in the horizontal plane and if equipped with independent vertical and horizontal aiming screws, the adjustment must be such that neither the vertical nor horizontal aim must deviate more than 100 mm from horizontal or vertical planes, respectively, at a distance of 7.6 m through an angle of $\pm 2.5^\circ$ and $\pm 4.0^\circ$, respectively.

S14.6.17.2.3 A sample headlamp that is aimed by moving the reflector relative to the lens and headlamp housing, and vice versa must provide a minimum adjustment range in the vertical plane not less than the full range of the pitch on the vehicle on which it is installed and $\pm 2.5^\circ$ in the horizontal plane.

S14.6.18 *Aiming adjustment test-on vehicle.*

S14.6.18.1 *Procedure.*

S14.6.18.1.1 A sample headlamp is mounted on the vehicle at nominal ($H = 0$, $V = 0$) aim with an accurate measuring device such as a spot projector or other equally accurate means attached.

S14.6.18.1.2 The installed range of static pitch angle is, at a minimum, determined from unloaded vehicle weight to gross vehicle weight rating, and incorporates pitch angle effects from maximum trailer or trunk loadings, the full range of tire intermix sizes and suspen-

sions recommended and/or installed by the vehicle manufacturer, and the anticipated effects of variable passenger loading.

S14.6.18.1.3 The headlamp is adjusted to the extremes of travel in each horizontal and vertical direction.

S14.6.18.2 *Performance requirements.*

S14.6.18.2.1 A sample headlamp tested per the procedure must provide a minimum vertical adjustment range not less than the full range of pitch of the vehicle on which it is installed.

S14.6.18.2.2 The vertical aim mechanism must be continuously variable over the full range.

S14.6.18.2.3 The adjustment of one aim axis through its full on-vehicle range must not cause the aim of the other axis to deviate more than $\pm 0.76^\circ$. If this performance is not achievable, the requirements of S10.18.3.1 apply, except that if the aiming mechanism is not a VHAD, the requirements specific to VHADs are not applicable, and the instruction must be specific to the aiming mechanism installed.

S14.7 *Replaceable light source physical test procedures and performance requirements.*

S14.7.1 *Deflection test for replaceable light sources.*

S14.7.1.1 *Procedure.*

S14.7.1.1.1 With the sample light source rigidly mounted in a fixture in a manner indicated in Figure 8, a force 4.0 ± 0.1 pounds ($17.8 \pm 0.4\text{N}$) is applied at a distance "A" from the reference plane perpendicular to the longitudinal axis of the glass capsule and parallel to the smallest dimension of the pressed glass capsule seal.

S14.7.1.1.2 The force is applied (using a rod with a hard rubber tip with a minimum spherical radius of .039 in [1 mm]) radially to the surface of the glass capsule in four locations in a plane parallel to the reference plane and spaced at a distance "A" from that plane. These force applications are spaced 90° apart starting at the point perpendicular to the smallest dimension of the pressed seal of the glass capsule.

S14.7.1.1.3. The bulb deflection is measured at the glass capsule surface at 180° opposite to the force application. Distance "A" for a replaceable light source other than an HB Type is the dimension provided in accordance with Appendix A of part 564 of this chapter, section I.A.1 if the light source has a lower beam filament, or as specified in section I.B.1 if the light source has only an upper beam filament.

S14.7.1.2 *Performance requirements.* After completion of the deflection test, a sample light source must have no permanent deflection of the glass envelope exceeding 0.13 mm in the direction of applied force.

S14.7.2 *Pressure test for replaceable light sources.*

S14.7.2.1 *Procedure.*

S14.7.2.1.1 The capsule, lead wires and/or terminals, and seal on each sample Type HB1, Type HB3, Type HB4, and Type HB5 light source, and on any other replaceable light source which uses a seal, is installed in a pressure chamber as shown in Figure 10 so as to provide an airtight seal. The diameter of the aperture in

Regulations

Figure 10 on a replaceable light source (other than an HB Type) must be that dimension furnished for such light source in compliance with Appendix A or Appendix B of part 564 of this chapter.

S14.7.2.1.2 The light source is immersed in water for one minute while inserted in a cylindrical aperture specified for the light source, and subjected to an air pressure of 70 KPa (10 psig) on the glass capsule side.

S14.7.2.2 *Performance requirements.* After completion of the pressure test, the sample light source with an airtight seal on the low pressure (connector side) must show no evidence of air bubbles on that side.

S14.7.3 *Replaceable light source power and flux measurement procedure.* The measurement of maximum power and luminous flux that is submitted in compliance with section VII of Appendix A of part 564 of this chapter, or section IV of Appendix B of part 564 of this chapter, is made in accordance with this paragraph.

S14.7.3.1 *Seasoning.* The filament or discharge arc is seasoned before measurement of either maximum power and luminous flux.

S14.7.3.1.1 *Resistive filament source.* Seasoning of a light source with a resistive element type filament is made in accordance with this S14.2.5.4 of this standard.

S14.7.3.1.2 *Discharge source.* For a light source using excited gas mixtures as a filament or discharge arc, seasoning of the light source system, including any ballast required for its operation, is made in accordance with section 4.0 of SAE Recommended Practice J2009 (1993) (incorporated by reference, see §571.5).

S14.7.3.2 *Test voltage.* Measurements are made with a direct current test voltage of 12.8 v regulated within one quarter of one percent.

S14.7.3.3 *Luminous flux measurement.* The measurement of luminous flux is made in accordance with IES LM 45 (incorporated by reference, see §571.5).

S14.7.3.3.1 *Resistive filament light source setup.* Luminous flux measurements are made with the black cap installed on Type HB1, Type HB2, Type HB4, and Type HB5, and on any other replaceable light source so designed; and is with the electrical conductor and light source base shrouded with an opaque white cover, except for the portion normally located within the interior of the lamp housing. The measurement of luminous flux for the Types HB3 and HB4 is made with the base covered with a white cover as shown in the drawings for Types HB3 and HB4 filed in Docket No. NHTSA 98-3397. The white covers are used to eliminate the likelihood of incorrect lumen measurement that will occur should the reflectance of the light source base and electrical connector be low.

S14.7.3.3.2 *Discharge light source setup.* With the test voltage applied to the ballast input terminals, the measurement of luminous flux is made with the black cap installed, if so designed, and is made with an opaque white colored cover, except for the portion normally located within the interior of the lamp housing.

S14.8 *Vehicle headlamp aiming devices (VHAD) physical test procedures and performance requirements.*

S14.8.1 *Samples.* The same VHAD and associated headlamp(s) or headlamp assembly must be rigidly

mounted in a headlamp test fixture with the aiming plane horizontal and vertical and with the scale on the device set at 0.

S14.8.2 *Scale graduation test.*

S14.8.2.1 *Procedure.* Check each graduation on the horizontal and vertical aim scales.

S14.8.2.2 *Performance requirements.* Scale graduation from correct aim must not exceed $\pm 0.2^\circ$ horizontally and $\pm 0.1^\circ$ vertically.

S14.8.3 *Cold scale graduation test.*

S14.8.3.1 *Procedure.* The VHAD and an unlighted headlamp assembly must then be stabilized at $-7^\circ \pm 3^\circ\text{C}$ in a circulating air environmental test chamber for a 30 minute temperature soak.

S14.8.3.2 *Performance requirements.* After completion of a 30 minute temperature soak the variation from correct aim shown by the sample VHAD must not exceed $\pm 0.2^\circ$ horizontally and $\pm 0.1^\circ$ vertically.

S14.8.4 *Hot scale graduation test.*

S14.8.4.1 *Procedure.* The VHAD and the headlamp assembly with its highest wattage filament, or combination of filaments intended to be used simultaneously, energized at its design voltage, is then stabilized at $38^\circ \pm 3^\circ\text{C}$ in a circulating air environmental test chamber for a 30 minute temperature soak.
