Chiral molecules, Cahn-Ingold-Prelog notation depends on the relative priorities of R and R''. Most data refers to racemates. For other triglycerides, see Glycerol trialkanoates (diacid, symmetrical), G-243, Glycerol trialkanoates (diacid, unsymmetrical), G-244 and individual entries for the monoacid triglycerides. The average Western diet contains 100-160g triacylglycerols per day. Although about 100 fatty acids are associated with dietary triacylglyerols, the more important nutritional fatty acids are derived from a relatively small number of congeners, esp. hexanoyl, octanoyl and 9,12-octadecadienoyl. Widely used in food processing. Modified triacylglycerols are used for the production of zero-*trans* margarines and low-calorie fats. Structured medium-chain derivs. are used in diets where malabsorption prevents the utilisation of naturally-occurring long-chain triacylglycerols. Some short-chain derivs. are used as food flavours and as food formulation aids. Naturally occurring triacylglycerols are biosynthesised from a pool of five or more fatty acids, and derivs. with two or three different acyl groups are usually formed; symmetrical triacylglycerols are less often produced. The number of possible triacylglycerols increases rapidly with the number of different acids present in the fatty acid pool. With two acids, eight triacylglycerols (including enantiomers) are formed. The number of possible triacylglycerols that can be formed from 20 fatty acids, with all isomers distinguished (incl. optical isomers) is 8000.

Gonyautoxin I G-297

[60748-39-2]

R = OSO_3H, R' = H

$C_{10}H_{17}N_7O_9S$ 411.352
Prod. by *Gonyaulax* and *Protogonyaulax* spp. and isol. from shellfish. Neurotoxin, causal agent, with Saxitoxin, of shellfish poisoning. Sol. H_2O. Closely related to Saxitoxin, S-50. The Gonyautoxins, esp. the *N*-sulfates, show reduced toxicity compared with Saxitoxin.

[303-45-7]
1,1′,6,6′,7,7′-Hexahydroxy-3,3′-dimethyl-5,5′-bis(1-methylethyl)-[2,2′-binaphthalene]-8,8′-dicarboxaldehyde, 9CI. Thespesin

Absolute Configuration

$C_{30}H_{30}O_8$ 518.562
Atropisomeric compd., occurs naturally in both (+)- and (±)-forms. Tautomeric in polar solvents with intramolecular bis-lactol and bis-ketol tautomers.Has undergone widespread trials in Peoples Republic of China. Toxicity and poor therapeutic potential has precluded further interest as a male contraceptive. Poorly sol. H_2O. Log P 7.06 (uncertain value) (calc). λ_{max} 237 (ϵ 60250); 277 (ϵ 26300); 375 (ϵ 15850) (MeOH) (Berdy).

He

He 4.003

Atomic No. 2. Ground state electron config. $1s^2$. Isol. in 1900 from atmospheric neon by Sir W. Ramsey and M.W. Travers (London). 5 Isotopes are known of which 2 are natural, ^3He, ^4He. Second most abundant element in the cosmos, 0.003 ppm (earth's crust); 5 ppm (v/v) in atm. At 2K, He(I) transforms into He(II) which is a superfluid. With increasing pressure: α-He (hcp) → β-He (fcc) → γ-He (bcc). Food processing aid. Colourless, odourless, tasteless, monatomic, non-toxic gas. Sol. 8.61 cm^3 kg^{-1} in H_2O. Mp -272.2° (under pressure). Bp -269°. Forms no normal chemical compds..

Hydrogen H-322

[1333-74-0]
Dihydrogen. Hydrogen 1. Protium. E949

H_2

H 1.008

Atomic No. 1. Ground state electron config. $1s^1$. H. Cavendish is regarded as the discoverer in 1766. 3 important isotopes. Deuterium (D) and radioactive Tritium (T) discovered in 1932 and 1934 respectively. Third most abundant element (after O and Si) on earth's surface. ^1H is stable with natural abundance 99.9975-99.9816 atom %. This isotope is the most important nucleus in nmr spectroscopy, but D and T are also nmr sensitive. Each isotope consists of equilib. mixt. of *ortho*- and *para*-forms (different nuclear spins). Solid H_2 is hcp normally but may be fcc under special conditions. Important in bonding (H-bonding) between the more electronegative elements. Used as a packaging gas. Stable, colourless, tasteless gas. V. low soly. most liqs. Mp -259°. Bp -252.6°. I = ½; μ = +2.7928456 μ_N. nmr relative sensitivity (^1H=1.00) 1.00 (by

definition); receptivity (^{13}C=1.00) 5680. Forms compounds with almost every other element.

▶ Not directly toxic but will cause asphyxiation. Forms explosive mixtures with air, O_2, halogens etc.. MW8900000

[99-96-7]

[29656-58-4]
p-*Salicylic acid. Catalpinic acid (obsol.)*

$C_7H_6O_3$ 138.123
Isol. from many plants, free and combined. Alkyl esters of 4-hydroxybenzoic acid (see below) are used as food and cosmetic preservatives, mainly in their Na salt form, which makes them more water soluble. They are active at low concentrations and more pH-independent than the commonly used Benzoic acid, B-31 and 2,4-Hexadienoic acid, H-172. The taste is more detectable than for those preservatives. Effectiveness increases with chain length of the alcohol, but for some microorganisms this reduces cell permeability and thus counteracts the increased efficiency. Prisms (xylene/EtOH), cryst. + $1H_2O$ (EtOH aq. or Me_2CO/EtOH). Sl. sol. H_2O. Lactic acid, 8CI, JAN, USAN. *Chem-Cast. Enyper. Kerlactine. Lactogyn. Lactolavol. Lactovagan. Neostil. Tonsillosan. Variclene. E270. FEMA 2611*

(R)-form

$C_3H_6O_3$ 90.079
Widely distributed in nature as a fermentation product from starch, molasses, potatoes etc. "Natural" lactic acid is produced commercially by fermentation of beet/cane sugar or glucose. No commercial lactic acid is dairy-based. Synthetic lactic acid is a racemic mixture of the L- and D-forms. Among the oldest known preservatives used to preserve milk products and a broad range of traditional fermented vegetables. The modern use of lactic acid as a food additive covers several functions: flavouring, acidity control, preservation. Due to its mild flavour, lactic acid can be used in high concentrations. Also in brewing, manuf. of cheese and confectionery. Log P -0.76 (calc).

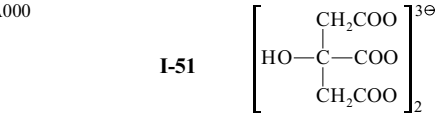
Iron I-51

[7439-89-6]
Ferrum (L.)

Fe 55.847

Atomic No. 26. Ground state electron config. $[Ar]3d^64s^2$. Known to ancient civilisations. 10 Isotopes reported of which 4 are stable, the most common being ^{56}Fe (91.6%). 4th most abundant element in earth's crust (62,000 ppm) with traces in sea water. Most important of all metals. Four allotropic forms (α, β,γ, δ) with transition temps. 770°, 928°, 1530°. α-Form (bcc) is magnetic; β-form (also bcc) is not magnetic. The following forms of Fe are used as nutrient supplements: carbonyl iron derived by decompn. of $Fe(CO)_5$; electrolytic iron derived by electrodeposition; reduced iron obtained by a chem. process. Silvery white metal, rel. soft when pure. Traces of impurities have profound effect on physical props. (steels). Rapidly oxidised, esp. in damp air (rust). Attacked by dil. acids (→ H_2). Passivated by HNO_3. Mp 1535°. Bp 3000° (2750°).



▶ Potentially toxic in all forms and by all routes of exposure, e.g. arc welder's lung. Ultrafine powdered metal is pyrophoric. NO4565500

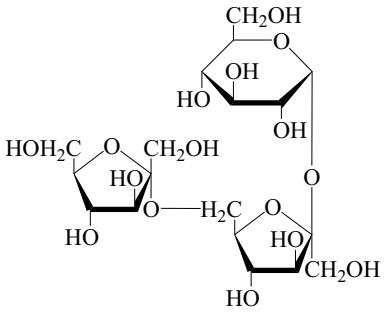
Kefiran K-29



Conts. an equal proportion of galactose and glucose residues. Mol. wt. of 20600 (average of 1127 hexose units). Isol. from Kefir grains, the inoculating material used for conversion of milk into the Russian beverage Kefir. Kefir grains consist of yeast and bacteria, predominantly *Saccharomyces delbruckii* and *Lactobacillus brevis*. About 25% of the dry material consists of the capsular polysaccharide of *Lactobacillus brevis*. Sol. H_2O. $[\alpha]_D$ +68 (c, 1.0 in H_2O).

Protein containing 162 amino acid residues of which four are Cys. The monomeric form has Mw 18000, but a dimeric form is also known. At least five genetic variants have been identified in cows, of which the A and B variants are the most important. These differ at positions 64 and 118, where Asp and Val respectively in variant A are substituted by Gly and Ala in variant B. Both variants have two disulfide bridges and one free cysteine. Numerous species variants are also known. The major whey protein in the milk of cows and many other mammals, comprising about 50% of the total protein. A major component of whey concentrates (obtained by ultrafiltration) and whey solids (obtained by spray drying), used to improve the functional and nutritional properties of many foodstuffs. Undergoes ready thermal denaturation and crosslinking with casein and other proteins in whey to form a coagulate known as lactalbumin (not to be confused with α-lactabumin) which is also used for protein fortification of foods.

Magnesium phosphate ($Mg(HPO_4)$) M-25

[7757-86-0]

[10043-83-1]

Magnesium phosphate (1:1), 9CI, 8CI. Magnesium hydrogenphosphate. Phosphoric acid, magnesium salt (1:1), 8CI

$Mg(HPO_4)$

$HMgO_4P$ 120.284

Anhydrous salt not obt. pure by thermal dehydration of hydrates because of simultaneous structural dehydration to give condensed salts. Used in foods as a nutritional source of Mg and P, pH control agent, dietary supplement, flow aid and leavening agent. Dec. on heating to 650° with evolution of H_2O and formation of $Mg_2P_2O_7$. In addition to the tri- and hepta-hydrates, a monohydrate and a hexahydrate have been reported.

Trihydrate: [7782-75-4]
Diamond-shaped rhombs. Sol. acids; spar. sol. H_2O. Loses $3H_2O$ at 130-300°, and 0.5 H_2O at 300-580° depending on heating rate, with formation of $Mg_2P_2O_7$ before much water driven off. Can lose 2.4 H_2O during vacuum drying. Orthorhombic. At pH 7.9 → Magnesium phosphate ($Mg_3(PO_4)_2$), M-26. Cryst. struct. possesses markedly distorted $PO_4^{3\ominus}$ tetrahedra, layers of which alternate with octahedrally coordinated Mg ions. Loses H_2O on grinding.

Heptahydrate: [13446-22-5]
Long, colourless prisms. Sol. acids; spar. sol. H_2O; insol. EtOH. Easily loses $4H_2O$.

Mineral-*form* [14654-11-6]
Newberyite
Essentially the trihydrate.Short colourless, transparent prismatic or tubular cryst. with vitreous lustre. Closely related is Hannayite.

Mineral-*form* [14654-10-5]
Phosphorrosslerite. Phosphoroesslerite
Essentially the heptahydrate.Normally pale yellowish, monoclinic prismatic cryst. with vitreous lustre (when fresh). Readily loses $4H_2O$.

Octahydrate: [13446-23-6]
The most stable hydrate. Possesses nuclear coord. H_2O. Prac. insol. (H_2O). Two kinds of cryst. lattice known, both monoclinic. H_2O molecules coord. by cation are non-equiv. Dehydrates in three stages at 110°, 280° and 370°.

Decahydrate: [10102-35-9]
Possesses nuclear coord. H_2O as well as H_2O of cryst. Said to occur in aq. solns..

Docosahydrate: [53408-95-0]
Colourless plates. Possesses nuclear coord. H_2O as well as H_2O of cryst. Triclinic unit cell. P–O 153.9-154.9 pm, OPO 108.6-110.5°. Mg–O 205-210.6 pm. Stable in air, unstable in aq. → octahydrate. Vacuum drying removes $18H_2O$. Otherwise, $20H_2O$ are lost at 150° and $1H_2O$ at 280°. Completely dehydrates at 320-600°.

Mineral-*form* [16225-79-9]
Bobierite
Essentially the octahydrate. Monoclinic, and closely related to the vivianite group. Octahedral edge-sharing dimers $Mg_2O_6(H_2O)_4$ and independent $MgO_2(H_2O)_4$ octahedra (Mg–O 203.0-213.9 pm) are linked by PO_4 tetrahedra (PbO 153.5-155.9 pm, OPO 107.2-112.0°). Complex sheets differ in one direction only from those of synthetic compound.Minute acicular or fibrous, transparent colourless cryst.
