Methyl α-linolenate hydroperoxides M-284

Methyl hydroperoxidooctadecatrienoates

$H_3CCH_2CH=CHCH_2CH=CHCH=CHCH(OOH)(CH_2)_7COOCH_3$ (9-isomer)

$C_{19}H_{32}O_4$ 324.459

Reaction with singlet oxygen produces the 9-, 10-, 12-, 13-, 15- and 16-hydroperoxides. Free radical autoxidn. produces the 9-, 12-, 13- and 16-hydroperoxides.. The 13-isomer is formed stereospecifically (13*S*-) by lipoxygenase which occurs in flax seed and cabbage leaves.

Ni 58.69

Atomic No. 28. Ground state electron config. $[Ar]3d^8 4s^2$. 9 Isotopes reported of which 5 are stable. Isol. in 1751 by A.F. Cronstedt. Known in alloys in early Chinese history. Biological role uncertain. Abundance: 99 ppm (earth's crust), traces (sea water). Fcc struct.. Catalyst for the hydrogenation of food fats and oils. Lustrous silvery-white, hard, malleable and ductile metal. Mp 1455°. Bp 2920° (2730°). Resistant to Cl_2, F_2, HCl, fused salts. Fairly good resistance to H_2SO_4, organic acids. Passivated by conc. HNO_3. Weakly ferromagnetic.

▶ Hypersensitivity to Ni is common. Ni powders or dry sponges may ignite spontaneousy. QR5950000

N≡N

N 14.007

Atomic No. 7. Ground state electron config. $[He]2s^22p^3$. 8 Isotopes known, of which 2 are stable, ^{14}N and ^{15}N. Recognition attributed to Rutherford, Scheele, Cavendish and Priestley in 18th century. Abundant in nature. Forms 78% by vol. of earth's atmosphere. In addition to the α-form (cubic, fcc) and β-form (hexagonal) there is a high pressure tetragonal (γ) form. α → β form at -238°. N≡N 110 pm. Used as a propellant and aerating agent in foods. Colourless, odourless, v. stable, non-flammable gas. Generally unreactive. V. sl. sol. H_2O; sol. liq. NH_3. d 0.8. Mp -210°. Bp -196°. T_{crit} -146°; P_{crit} 35 atm; V_{crit} 5.17 cm^3. Reacts with Li at r.t. to give Li_3N.

H_2O (5.54 g per 100 cm^3 at 0°, 1.93 g per 100 cm^3 at 100°); more sol. org. solvs. d^{-183} 1.13. Mp -218.4°. Bp -183°. Paramagnetic with $2e^{\ominus}$ in antibonding π orbitals. T_{crit} -118.8°; P_{crit} 49.7 atm. Solid O_2 exists in α- (rhombic), β- (rhombohedral), and γ- (cubic) forms. O=O 120.8 pm.
Trioxygen: [10028-15-6] ***Ozone, 11CI***
O_3 47.998
Antimicrobial agent used in the production of bottled water. Also used in the treatment of meat, poultry and

other foodstuffs. Colourless gas; deep blue liq. with characteristic odour at low concn.; blue- or violet-black solid. Sl. sol. H_2O. d^{-183} 1.78. Mp -192.5° Mp -251°. Bp -112.3°. Struct. established in 1872. Interatomic distance: O–O 127.8 pm; angle: OOO 116.8°.

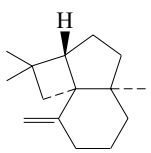
Attapulgite

$Mg_5[Si_2O_5]_4(OH)_2.8H_2O$

$H_{18}Mg_5O_{34}Si_8$ 908.331



Mineral. The name palygorskite is used both for the group of fibrous clay minerals in the attapulgite-sepiolite series, and for the specific mineral specimens that are similar to sepiolite except for some replacement of Mg by Al. A layer silicate. Also formulated as $(Mg,Al)_2Si_4O_{10}(OH).4H_2O$. Used in foods as a clarifying and flocculating agent. White or grey monoclinic or orthorhombic cryst.

Patatin P-44

A family of closely related glycoproteins with apparent molecular weight of 40 kD. The major storage protein in potato tubers comprising 40% of total soluble protein. Not present in leaves, roots or stems. Possesses lipid acylesterase activity which may be implicated in host defense mechanism. A number of genetic variants are listed in the CAS Index guide, the CAS nos. of which are listed here. The full struct. of at least one genetic variant is known.

Pectic acid P-53

[9046-40-6]
Pectinic acid. Pectin

Colloidal polygalacturonic acids which are essentially completely deesterified and with varying degrees of neutralisation are referred to as pectic acids. Pectinic acids are colloidal polygalacturonic acids with more than a negligible content of Me ester groups with varying degrees of neutralisation. The term pectins refers to those water-soluble pectinic acids of varying Me ester content and degree of neutralisation that are capable of forming gels with sugar and acid under suitable conditions. In pectins, the α-(1→4)-linked D-polygalacturonate sequences are interrupted with (1→2)-L-rhamnose residues, neutral sugars, e.g. D-galactose and L-arabinose, form side chains on the pectin molecules. The mol. wt. of pectins is 20,000 - 400,000. Present in cell walls of all plant tissues. Up to 30% w/w of this polysaccharide can be isol. from orange and lemon rind. Used in food processing as a gelling agent, stabiliser, thickener and emusifier.

Pelletierine P-56

[4396-01-4]

1-(2-Piperidinyl)-2-propanone, 9CI. 2-Acetonylpiperidine. Isopelletierine. 8-Methylnorlobelone

(R)-form

$C_8H_{15}NO$ 141.213

Pelletierine was originally given the erroneous struct. of 3-(2-piperidinyl)propanal. The early use of the names Pelletierine and Isopelletierine is confusing.Log P 0.56 (calc).

(*R*)-*form* [2858-66-4]

Alkaloid from pomegranate. Liq. $[\alpha]_D^{23}$ -18.1 (c, 8.18 in EtOH). The isoln. of the (*R*)-form is doubtful in view of its ready racemisation and of the fact that the opt. rotn. recorded for the isolate exceeded that of the resolved base.

2-(3,4-Dihydroxyphenyl)-3,5,7-trihydroxy-1-benzopyrylium(1+), 9CI. ***Cyanidin***. *Cyanidol*†

$C_{15}H_{11}O_6^{\oplus}$ 287.248
Various methyl ethers have separate entries. Widely distributed anthocyanidin, found esp. in *Vaccinium* spp. (blueberries, bilberries, whortleberries), cherries, raspberries, red onions, red wine and black tea. Chocolate-brown cryst. (EtOH/HCl) or red-brown needles (as chloride). Dec. >200° (chloride).

3-O-β-L-Arabinoside: [27214-72-8] *Cyanidin 3-arabinoside*
$C_{20}H_{19}O_{10}^{\oplus}$ 419.364
Isol. from numerous plant spp. including red pears and apples. Almost black prisms (as chloride).

7-O-Arabinoside: [28985-03-7] *Cyanidin 7-arabinoside*
$C_{20}H_{19}O_{10}^{\oplus}$ 419.364
Isol. from the apple tree *Malus* sp..

3-O-Xyloside: [29761-24-8] *Cyanidin 3-xyloside*
$C_{20}H_{19}O_{10}^{\oplus}$ 419.364
Isol. from apples.

Phosphatidylcholine P-325

[8002-43-5]
1,2-Diacylglycero-3-phosphocholine. Lecithin. Vitellin. Kelecin. Granulestin. Lecithol. Diacyllecithin. Diacylphosphatidylcholine. E322

(*R*)-form

R, R' = acyl groups

The naturally occurring (*R*)-form is equivalent to 1,2-diacyl-*sn*-glycero-3-phosphocholine (*sn*-3-phosphatidylcholine). See also Phosphatidylcholine, P-325. First identified in egg yolk, ox brain and soybean oil. Present throughout the animal and vegetable kingdoms. Used in food processing as an emulsifier and anti-sticking agent. The degree of unsaturation and chain length result in distinct physical and biol. props. Mammalian phosphatidylcholine usually has a saturated acyl group at *sn*-1 and and an unsaturated group at *sn*-2. The term lecithin is also used to describe a mixture of phosphatidyl esters isolated from vegetable oils and consisting mainly of phosphatidylcholine, -serine, -ethanolamine and -inositols with some triglycerides, fatty acids and carbohydrates. There is extensive proliferation of CAS numbers for phosphatidylcholines owing to specification of stereochemistry at different levels of precision in the literature.

3-Phosphatidylinositol P-326

1,2-Diacylglycerol-3-phosphoinositol

Naturally occurring phosphatidylinositol is a 1,2-diacyl-*sn*-glycerol derivative of myoinositol 1-phosphate having various alkyl groups R^1 and R^2 which may be the same or different and may be saturated or unsaturated. The abs. config. of the natural form is *R*-glycero, D-myoinositol as illus. and the props given for individual members of the series refer to this isomer unless otherwise stated. Isol. from peas. Comprise about 5% of membrane phospholipid content of eukaryotes.

H_3O_4P 97.995

A strong tribasic acid. Possesses a H-bonded layer struct. in which each molecule is linked to six others. Found in fruit juices. Used in foods as an acidulant for drinks and candies, pH control agent, buffering agent, flavour

enhancer, flavouring agent, sequestrant, stabiliser and thickener, and synergist. Colourless cryst. or syrup. Misc. H_2O, many org. solvs. d 1.86. Mp 42.3°. n_D^{20} 1.4503. pK_{a1} 2.15; pK_{a2} 7.2; pK_{a3} 12.4 (H_2O). Melts to a syrup and may be supercooled to a glass which yields a second cryst. form at -54°, reverting at -6° to the form stable at r.t. Complexes with a wide variety of compds. e.g. ketones and ethers. When heated strongly partial dehydration → Diphosphoric acid.

Plastoquinone P-410

A series of homologous prenylated quinones where n defines the plastoquinone number. The side-chain may be unsubstituted (Plastoquinones), monohydroxylated (Plastoquinone C), monoacylated (Plastoquinone B) or monohydroxylated and monoacylated (Plastoquinone Z). The latter classes appear to be confined to higher plant tissues.

Plastoquinone 3 [1168-52-1]
Plastoquinone 15

Polyvidone, INN P-422

[9003-39-8]

Povidone, BAN, USAN. *1-Ethenyl-2-pyrrolidinone homopolymer, 9CI. Plasdone. Vinisil. Polyvinylpyrrolidone. Kollidon. Disadine. Many other names*

C_6H_9NO 111.143

Polymer. Monomer formula given. Used as a diluent in colour additive mixtures for marking food; in coatings on fresh citrus fruits; as a clarifying agent for beer, wine and vinegar; as a tableting adjuvant. Faintly yellow solid. The name Crospovidone, INN, USAN also appears to be used.

▶Carcinogen (IARC Group 3). Exp. tumourigenic data. TR8180000

I_2complex: [25655-41-8] ***Povidone-Iodine, BAN, USAN.*** *Betadine. PVP-Iodine. Iodopovidonum. Jodpolyvinylpyrrolidon. Pevidine. Many other names*
Yellowish-brown amorph. powder. ^{125}I and ^{131}I labelled compounds, (Povidone I 125, USAN and Povidone I 131) are used as radioactive agents.

▶Can cause skin haemorrhage and dermatitis. LD_{50} (rat, orl) >8000 mg/kg. LD_{50} (rat, scu) 3450 mg/kg. TR1579600

C_3H_4O 56.064
Present in fruit aromas, black tea, carrot, cooked potato, cheeses, white wine, hydrolyzed soy protein, turkey, pork, beef fat and other foods. Used as an etherification agent in the preparation of modified food starches. Herbicide and algicide used in water treatment. Prod. by microorganisms, e.g. *Clostridium perfringens*. Strongly lachrymatory liq. V. sol. H_2O; sol. EtOH, Et_2O, Me_2CO. d_4^{20} 0.84. Mp -87°. Bp 52°. n_D^{20} 1.3998. Vp 220 mmHg (20°). Unstable, polymerises to a white translucent solid Disacryl. Hydroquinone is used as a stabiliser to prevent autoxidn. and polym..
▶ Highly flammable, fl. p. -26°, autoignition temp. 220/235°. Can undergo violent acid- and base-catalysed polym. Irritating to all tissues. Vesicant. Inhalation may cause pulmonary oedema. Potent lachrymator. OES: long-term 0.1 ppm; short-term 0.3 ppm. AS1050000
