Disodium phosphate, 9CI, 8CI D-980

[7558-79-4]

Disodium monohydrogenphosphate. Sodium phosphate (Na_2HPO_4). Sodium phosphate dibasic, USAN

Na_2HPO_4

HNa_2O_4P 141.959

^{32}P labelled compd. is used as an antineoplastic and antipolycythermic agent and as a neoplasm diagnostic aid (Phosphote). Used in foods as a sequestrant, emulsifier, buffering agent, absorbent, pH control agent, protein modifier, source of alkalinity, stabiliser and nutrient supplement. Hygroscopic powder. Sol. H_2O (6.4 g per 100 cm^3 at 18°; 12.1 g per 100 cm^3 at 25°). Dehydrates to Sodium diphosphate ($Na_4(P_2O_7)$), S-126 at 290-380°. ΔH_f° -1746 kJ mol^{-1}.

▶ Eye and skin irritant. WC4500000

Dihydrate: [10028-24-7] *Sorenson's sodium phosphate. Sorenson's salt*
$H_5Na_2O_6P$ 177.989
V. sol. H_2O (100 g per 100 cm^3 at 50°; 117 g per 100 cm^3 at 80°). Orthorhombic. Two independent distorted Na polyhedra (coordination numbers 5(or 6) and 6(or 7)) share corners, edges or faces. $PO_3(OH)$ tetrahedra are H-bonded and lie between the Na chains. ΔH_f -2344 kJ mol^{-1}. Loss $2H_2O$ at 95°.

Heptahydrate: [7782-85-6]
$H_{15}Na_2O_{11}P$ 268.065
Colourless monoclinic prisms (H_2O at 40°). V. sol. H_2O. ΔH_f -3821 kJ mol^{-1}. The prominent structural feature is a column of face- and edge-sharing $[Na_2(OH_2)_7]^{2\oplus}$ octahedra H-bonded to tetrahedral $PO_3(OH)$ groups. Mean Na –O 241.8, P–O 155.1 pm, OPO 102.7-114.2°. Loses $7H_2O$ at 60-140°.

▶ WC4600000

Dodecahydrate: [10039-32-4]
$H_{25}Na_2O_{16}P$ 358.141
Colourless efflorescent cryst. (H_2O) or white powder; β-form cryst. < 30°, α-form at 30-35°. Sol. H_2O (87 g per 100 cm^3 at 34°); insol. EtOH. ΔH_f -5299 kJ mol^{-1}. β-Form consists of close-packed layers of $[Na(OH_2)_6]^{\oplus}$ octahedra, 1/3 of which are replaced by PO_4 tetrahedra, with no interstitial H_2O molecules; the PO_4 tetrahedra each lie at the centre of a pseudo-hexagonal mesh of Na octahedra. Mean P–O 153.6 pm. Loses $12H_2O$ at ≤ 120°.

▶ TC5725000

H_2O_2 complex (1:1): [25215-15-0] *Disodium phosphate peroxohydrate. Phosphoric acid disodium salt compd. with H_2O_2 (1:1), 11CI*
Colourless, hygroscopic solid.

Telluric acid (H_6TeO_6) complex (1:1), monohydrate: [70929-99-6]
Colourless, hexagonal-bipyramidal cryst. Hexagonal. P–O 154, Te–$O_{av.}$ 192 pm and OPO 109.3-109.7°.

[141-78-6]
Ethyl ethanoate. Acetic ester. FEMA 2414
$H_3CCOOEt$
$C_4H_8O_2$ 88.106
Found in cereal crops, radishes, fruit juices, beer, wine, spirits etc. and produced by *Anthemis nobilis* (Roman chamomile) and *Rubus* spp. Used in artificial fruit essences. Used as a solvent in the manufacture of modified hop extract and decaffeinated tea or coffee. Also used for colour and inks used to mark fruit or vegetables. A volatile flammable liq. with characteristic, fruity odour. Misc. most org. solvs., sol. 13 parts H_2O at 15°, less sol. at higher temps. Slowly hydrol. by H_2O. Forms azeotrope with H_2O, 6.1% w/w, Bp 70.4°.
▶ Highly flammable, fl. p. -4°, autoignition temp. 426°. May ignite or explode with $LiAlH_4$. Irritant to eyes, skin and mucous membranes. High vapour conc. narcotic and can damage liver and kidneys. Prolonged or repeated exposure causes conjunctival irritation and corneal clouding. LD_{50} (rat, orl) 5620 mg/kg. OES: long-term 400 ppm. Fructose aminoacids F-76

Naturally occurring compds. are derived from D-fructose and L-aminoacids. Amadori products resulting from sugar-aminoacid interactions in food products, esp. cooked foods.

Fructose-alanine [16124-24-6]

[71887-76-8, 86334-91-0, 87251-67-0, 87251-77-2, 87332-29-4]
1-[(1-Carboxyethyl)amino]-1-deoxyfructose, 9CI. N-*(1-Deoxy-1-fructosyl)alanine. 1-Deoxyalaninofructose*

$C_9H_{17}NO_7$ 251.236
Cryst. (MeOH aq./1-butanol). Mp 184° dec. $[\alpha]_D^{20}$ -61.2 (c, 2 in H_2O). α- and β-furanose and pyranose forms present in soln..

Fructose-glycine [60644-20-4]

[4429-05-4]
1-[(Carboxymethyl)amino]-1-deoxyfructose, 9CI. N-*(1-Deoxy-1-fructosyl)glycine*

$C_8H_{15}NO_7$ 237.209
Prisms. Mp 146.5-147.5°. $[\alpha]_D^{25}$ -66 (c, 1 in H_2O). β-Pyranose form predominates in aq. soln. and cryst. state.

Fructose-histidine [25020-13-7]
*1-[[1-Carboxy-2-(1*H*-imidazol-4-yl)ethyl]amino]-1-deoxyfructose, 9CI.* N-*(1-Deoxy-1-fructosyl)histidine*
$C_{12}H_{19}N_3O_7$ 317.298
Light yellow powder. Mp 130° dec. $[\alpha]_D^{20}$ -30.5 (c, 0.3 in H_2O).

Fructose-isoleucine [87304-79-8]

[34393-17-4]
1-[(1-Carboxy-2-methylbutyl)amino]-1-deoxyfructose. N-*(1-Deoxy-1-fructosyl)isoleucine*

$C_{12}H_{23}NO_7$ 293.316
Powder. Mp 120° dec. $[\alpha]_D^{20}$ -31 (c, 1.6 in H_2O).

Fructose-leucine [34393-18-5]
1-[(1-Carboxy-3-methylbutyl)amino]-1-deoxyfructose, 9CI. N-*(1-Deoxy-1-fructosyl)leucine*
$C_{12}H_{23}NO_7$ 293.316

Needles (butanol). Mp 145° dec. $[\alpha]_D^{20}$ -37 (c, 0.5 in H_2O). β-Pyranose form predominates in soln..

Fructose-methionine [20638-92-0]
1-[[1-Carboxy-3-(methylthio)propyl]amino]-1-deoxyfructose, 9CI. N-*(1-Deoxy-1-fructosyl)methionine*

$C_{11}H_{21}NO_7S$ 311.355
Cryst. (EtOH/butanol). Mp 95° dec. $[\alpha]_D^{20}$ -34 (c, 0.35 in H_2O).

Fructose-phenylalanine [87251-83-0]

[31105-03-0, 50826-04-5, 71887-77-9]
1-[(1-Carboxy-2-phenylethyl)amino]-1-deoxyfructose, 9CI. N-*(1-Deoxy-1-fructosyl)phenylalanine*

$C_{15}H_{21}NO_7$ 327.333
Cryst. (butanol aq.). Mp 143° dec Mp 170° (browning at 140°). $[\alpha]_D^{20}$ -34 (c, 2.2 in H_2O).

Fructose-proline [29118-61-4]

[5388-44-3]
1-(2-Carboxy-1-pyrrolidinyl)-1-deoxyfructose, 9CI. N-*(1-Deoxy-1-fructosyl)proline. 1-Deoxyprolylfructose*

$C_{11}H_{19}NO_7$ 277.274
Needles (MeOH). Mp 145° dec. $[\alpha]_D^{20}$ -92.7 (c, 0.44 in H_2O).

Fructose-serine [87251-79-4]

[34393-26-5, 57288-23-0]
1-[(1-Carboxy-2-hydroxyethyl)amino]-1-deoxyfructose, 9CI. N-*(1-Deoxy-1-fructosyl)serine*

$C_9H_{17}NO_8$ 267.235
Needles. Mp 110° dec. $[\alpha]_D^{20}$ -46 (c, 2.3 in H_2O).

Fructose-threonine [70954-04-0]
1-[(1-Carboxy-2-hydroxypropyl)amino]-1-deoxyfructose, 9CI. N-*(1-Deoxy-1-fructosyl)threonine*

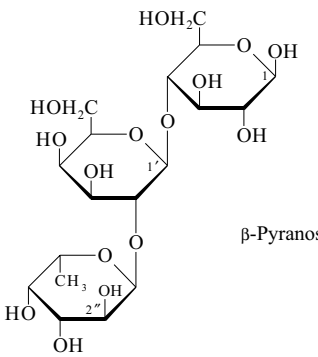
$C_{10}H_{19}NO_8$ 281.262
Monohydrate. Mp 108° dec. $[\alpha]_D^{20}$ -47 (c, 0.4 in H_2O).

Fructose-tryptophan [25020-15-9]
1-[[1-Carboxy-2-(1H-indol-3-yl)ethyl]amino]-1-deoxyfructose, 9CI. N-*(1-Deoxy-1-fructosyl)tryptophan*

$C_{17}H_{22}N_2O_7$ 366.37
Cryst. + $2H_2O$ (butanol aq.). Mp 143° dec (dihydrate). $[\alpha]_D^{20}$ -40 (c, 0.3 in H_2O).

Fructose-tyrosine [34393-22-1]
1-[[1-Carboxy-2-(4-hydroxyphenyl)ethyl]amino]-1-deoxyfructose, 9CI. N-*(1-Deoxy-1-fructosyl)tyrosine*

$C_{15}H_{21}NO_8$ 343.333
Mp 115° dec. $[\alpha]_D^{20}$ -16 (c, 0.5 in DMSO).



Fructose-valine
1-[(1-Carboxy2-methylpropyl)amino]-1-deoxyfructose, 9CI. N-*(1-Deoxy-1-fructosyl)valine*

$C_{11}H_{21}NO_7$ 279.289
Cryst. (MeOH aq.). Mp 156° dec. $[\alpha]_D^{20}$ -42.9 (c, 2 in H_2O). β-Pyranose form predominates in soln..

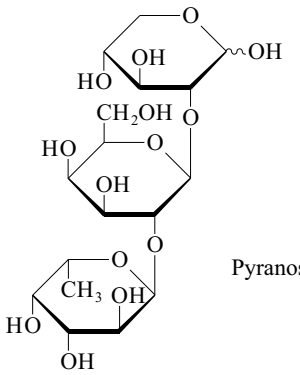
α-L-Fucopyranosyl-(1 → 2)-β-D-galactopyranosyl-(1 → 4)-D-glucose, 9CI, 8CI F-77

[41263-94-9]
2′-Fucosyllactose



β-Pyranose-*form*

$C_{18}H_{32}O_{15}$ 488.442
Present in the free state in human milk. Solid (EtOH). Mp 230-231°. $[\alpha]_D$ -53.5 → -57.5 (72h) (c, 2.0 in H_2O). $[\alpha]_D$ -43 → -48 (c, 0.47 in H_2O).

Fucose F-81

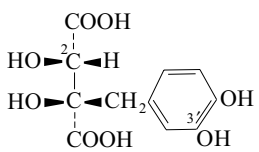
6-Deoxygalactose. Rhodeose. Galactomethylose

α-D-Pyranose-*form*

$C_6H_{12}O_5$ 164.158

An aq. soln. at 31°C contains 28% α-pyr, 67% β-pyr, =5% fur and 0.01% aldehyde.

L-*form* [2438-80-4]
A constit. of the polysaccharides obt. from gum tragacanth. Also found in glycoproteins obt. from milk. Prisms (EtOH). Mp 145° (140-141°). $[\alpha]_D^{17}$ -124 → -76 (c, 2.0 in H_2O).



2-Me: [34299-00-8] *2*-O-*Methyl-*L*-fucose*
$C_7H_{14}O_5$ 178.185
Present in plant polysaccharides, e.g. of *Prunus domestica* (plum). Mp 150-152°. $[\alpha]_D^{23}$ -88 (c, 1.02 in H_2O).

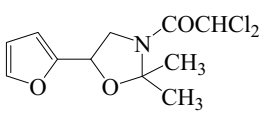
Furcelleran F-142

[9000-21-9]
Furcelleran gum. Danish agar. Burtonitte 44



A sulfated polysaccharide, the dominant hexose units of which are galactose, anhydrogalactose and their half-ester sulfates. Emulsifier, stabiliser, thickening agent. Furcelleran 'salts' prepd. by increasing the concentration of the naturally occurring cations (ammonium, calcium, potassium or sodium) have similar utility.

[26566-34-7]
Sorbitol. Gulitol. gulo-*Hexitol.* gluco-*Hexitol. E420*

$C_6H_{14}O_6$ 182.173
For stereoisomers see Allitol, Galactitol, Iditol, D-Mannitol, and Talitol. Sorbitol is a common trivial name for glucitol but is imprecise and should be discouraged. Reduction of sorbose can produce either glucitol or iditol. Furthermore, D-glucitol is usually referred to as D-sorbitol whereas reduction of D-sorbose gives L-glucitol.

D-*form* [50-70-4]
D-Glucitol. L-Gulitol. FEMA 3029. Many other names
Occurs widely in plants ranging from algae to the higher orders. Fruits of the plant family Rosaceae, which include apples, pears, cherries, apricots, contain appreciable amounts. Rich sources are the fruits of the *Sorbus* and *Crataegus* spp. Sweetening agent and humectant and many other food uses. Needles + ½ or $1H_2O$ (EtOH) with sweet taste (60% of sucrose). Freely sol. H_2O; fairly sol. hot EtOH; spar. sol. cold EtOH. Mp 92° (labile form) Mp 97° (stable form) Mp 110-112° (anhyd.). $[\alpha]_D$ +7 (borax). $[\alpha]_D$ +31 (molybdate). pK_a 13 (60°). The name D-Sorbitol has been used for this compound but should not be employed (see above). Several polymorphs known.

Enzyme. Used in the manuf. of glucose and fructose syrups, in brewing low calorie beers, and in increasing fruit juice yields. Hydrolyses terminal 1,4-linked α-D-glucose residues successively from non-reducing ends of polysaccharide chains with release of β-D-glucose; acts on amylose and amylopectin.

Glucose oxyhydrase. β-D-Glucose: oxygen 1-oxidoreductase. Glucose aerodehydrogenase. Corylophyline. E.C. 1.1.3.4. GOD

A flavoprotein, MW 160 kDa, consisting of 2 identical subunits each containing one FAD unit as cofactor; glycosylated with a carbohydrate content of 16% (w/w). Catalyses the oxidn. of β-D-glucose to D-glucono-1,5-lactone and H_2O_2 using O_2 as the electron acceptor. Used in the food industry as a non toxic preservative to remove residual glucose and oxygen from food and beverages. Amorph. powder or cryst. Sol. H_2O; prac. insol. EtOH, $CHCl_3$, Et_2O.

Glycerol 1-alkanoates G-236

1-O-*Acylglycerols*

(S)-form

Chiral compds. The (*S*)-enantiomers correspond to 1-*O*-acyl-*sn*-glycerol. The diacetates are components of Acetolein, glycerol esterified with long-chain fatty acids and acetic acid, which is presumably used in foods such as ice-cream. Acyl migrations, particularly under the influence of heat, acidic or alkaline conditions, can result in the interconversion of 1(3)-acyl- and 2-acylglycerols.

Glycerol 1,2-dialkanoates G-239

1,2-Di-O-*acylglycerols*

(*S*)-*form*

Chiral molecules, whether R and R′ are the same or different. The biol. important S-enantiomer corresponds to 1,2-diacyl-*sn*-glycerol. 3-Phosphates have the *R*-config. Props. of individual compds. refer to this enantiomer unless otherwise stated. Surfactants, used as food emulsifiers. Other food-processing uses for mixts. of mono- and diglycerides include dough strengthener, formulation aid, flavouring agent, lubricant, stabiliser, surface active agent, and texturiser. Acyl migration, particularly under the influence of heat, acidic or alkaline conditions, can result in the interconversion of 1,2-di-*O*-acyl- and 1,3-di-*O*-acylglycerols. Commercial preps., prepared by chemical glycerolysis of triacylglycerols, contain mixts. of mono- and diacylglycerols. The diacylglycerol component forms an equilib. mixt. with a mole ratio of approx. 1.5:1 of the 1,3- and 1,2(2,3)-regioisomers.

Glycerol 1,3-dialkanoates G-240

*1,3-Di-*O*-acylglycerols*
$RCOOCH_2CH(OH)CH_2OOCR'$
Meso-compds. if the R groups are identical. Potentially opt. active if they are different. Data given here refers to racemates unless stated otherwise.Acyl migration, particularly under the influence of heat, acidic or alkaline conditions, can result in the interconversion of 1,2-di-*O*-acyl- and 1,3-di-*O*-acylglycerols. Commercial preparations, prepared by chemical glycerolysis of triacylglycerols, contain mixtures or mono- and diacylglycerols. The diacylglycerol component forms an equilibrium mixture with a mole ratio of approximately 1.5:1 of the 1,3- and 1,2(2,3)-regioisomers.

Glycerol trialkanoates (diacid, symmetrical) G-243

Triacylglycerols (diacid, symmetrical)
$RCOOCH_2CH(OR')CH_2OOCR$
Meso-compds. For the unsymmetrical 1,2-R, 3-R′ isomers, see Glycerol trialkanoates (diacid, unsymmetrical), G-244. For triacid isomers 1R,2R′,3R″, see Glycerol trialkanoates (triacid), G-245. Monoacid triglycerides have individual entries, e.g. Glycerol trihexadecanoate, G-254. The average Western diet contains 100-160g triacylglycerols per day. Although about 100 fatty acids are associated with dietary triacylglyerols, the more important nutritional fatty acids are derived from a relatively small number of congeners, esp. hexanoyl, octanoyl and 9,12-octadecadienoyl. Widely used in food processing. Modified triacylglycerols are used for the production of zero-*trans* margarines and low-calorie fats. Structured medium-chain derivs. are used in diets where malabsorption prevents the utilisation of naturally-occurring long-chain triacylglycerols. Some short-chain derivs. are used as food flavours and as food formulation aids. Glycerol trialkanoates (diacid, unsymmetrical) G-244

Triacyglycerols (diacid, unsymmetrical). Unsymmetrical diacid triglcerides
$ROOCCH_2CH(OR)CH_2COOR'$
Chiral molecules. Cahn-Ingold-Prelog config. depends on the priorities of R and R′. For other triglycerides see Glycerol trialkanoates (diacid, symmetrical), G-243 and Glycerol trialkanoates (triacid), G-245 plus individual entries for the monoacid triglycerides. The average Western diet contains 100-160g triacylglycerols per day. Although about 100 fatty acids are associated with dietary triacylglycerols, the more important nutritional fatty acids are derived from a relatively small number of congeners, esp. hexenoyl, octanoyl and 9,12-octadecadienoyl. Widely used in food processing. Modified triacylglycerols are used for the production of zero-*trans* margarines and low calorie fats. Structured medium-chain derivs. are used in diets where malabsorption prevents the utilisation of naturally-occurring long-chain triacylglycerols. Some short-chain derivs. are used as food flavours and as food formulation aids. Naturally occurring triacylglycerols are biosynthesised from a pool of five or more fatty acids, and derivs. with two or three different acyl groups are usually formed; symmetrical triacylglycerols are less often produced. The number of possible triacylglycerols increases rapidly with the number of different acids present in the fatty acid pool. With two acids, eight triacylglycerols (including enantiomers) are formed. The number of possible triacylglycerols that can be formed from 20 fatty acids, with all isomers distinguished (incl. optical isomers) is 8000.
