Starch, 9CI, 8CI S-219

[9005-25-8]

Amylum. Polyamylose

Starch is composed of Amylose and Amylopectin. Amylose is preponderantly a linear polymer of several thousand D-glucose units mainly α-(1→4) linked. Amylopectin is a branched polymer composed largely of α-D-(1→4)-linked glucose units. The branch is α-(1→6) and occurs at the 6 position every 20-25 glucose units. Pullulanase, *R*-enzyme and Isoamylase hydrol. the α-D-(1→6) linkages. Polymeric. Minimum formula given.

▶ Starch dust is a respiratory tract irritant OES (8-hr TWA) total inhalable dust 10 mg m^{-3}, respirable dust 5 mg m^{-3}. Mod. explosive when exposed to flame.

Phosphate: [11120-02-8]

[39373-98-3]

Stabiliser, thickener, moisture control agent., flavour modifier, release agent and firming agent for processed foods. Many different structs. are present at different phosphorylation levels.

Carboxymethyl ether: [9057-06-1]
Modified starch used as thickening agent in food industry. Powder.

2-Hydroxypropyl ether: [9049-76-7]
Used in food processing including stabiliser, thickener, moisture control agent, flavour modifier, release agent, handling and firming agent.

Unbranched-*form* [9005-82-7]

Amylose

Stored in all parts of plants as insol. granules. Coml. starches come mainly from corn (maize), sorghum grains, tapioca root and potato tuber. Most starch samples contain 20 ± 5% Amylose which can be pptd. from aq. starch soln. with, e.g., Thymol. Various uses in food processing including thickener, stabilizer, flavour modifier, filler for baking powder, flour additive, firming agent and release/antisticking agent. Many modified forms also used. $[\alpha]_D$ +200 (H_2O). $[\alpha]_D$ +162 (1*M* NaOH). $[\alpha]_D$ +175 (DMSO). Hydrol. by acid, α-Amylase and β-Amylase. Forms inclusion complexes, gives a deep-blue colour with I_2. Four polymorphs (A,B,C and V amyloses) have been studied structurally and differ in helical conformation and packing.

Per-Ac:

[9045-28-7]

Many uses in processed foods including stabilizer, thickener, moisture control, flavour modifier, release/antisticking agent and firming agent. $[\alpha]_D$ +175 ($CHCl_3$).

Branched-*form* [9037-22-3]

Amylopectin

$[\alpha]_D$ +200 (H_2O). $[\alpha]_D$ +163 (1*M* NaOH).

Triterpenoid-monoterpenoid saponins T-820

A class of oligomeric-type saponins consisting of a pentacyclic triterpenoid sapogenin linked to one or more linear C_{10} monoterpenoid (linalooyl type) residues and a number of glycoside residues. The triterpenoid residues in all saponins so far characterised are oleanenecarboxylic acids but these vary in degree of hydroxylation. The points of attachment and order of assembly of the monoterpenoid groups and the sugar residues varies. Gymnocladussaponin F_1, illus., is typical..

[9014-63-5]
$C_5H_8O_4$ 132.116
A typical hemicellulose pentosan formed by chains of (1→4) linked β-D-xylopyranosyl residues. True xylans, composed exclusively of D-xylose residues, are extremely rare. Esparto grass D-xylan is an example. Polymeric. Minimum formula given. Occurs in all land plants, component of dietary roughage. $[\alpha]_D^{21}$ -92 (c, 0.5 in 0.5*N* NaOH). Approved by FDA (1996) (as sodium salt)

Poly(hydrogen sulfate): [37300-21-3] *Pentosan polysulfate. Xylan hydrogen sulfate, 9CI. Xylan polysulfate. Fibrase. Hemoclar. Thrombocid. CB 8061. SP 54. Fibrezym. Cartrophen vet. PZ 68*
$[\alpha]_D^{20}$ -57 (Na salt). Used as sodium salt (Pentosan polysulfate sodium, BAN, INN, USAN).
