Molecular Formula Index

The Molecular Formula Index lists the molecular formulae of all drugs in the Dictionary whether they occur as main Entry compounds or as derivatives.

Where a molecular formula applies to a derivative the Dictionary Number is prefixed by the word '*in*'.

The Symbol ▷ preceding an index term indicates that the Dictionary Entry contains information on toxic or hazardous properties of the compound.

Chemical Abstracts Service Registry Number Index

This Index lists in numerical order all Chemical Abstracts Service (CAS) registry numbers contained in the Dictionary.

Where a CAS registry number applies to a derivative or to a stereoisomer or other variant embedded within the entry, the Dictionary number is preceded by the word '*in*'.

The symbol ▷ preceding an index term indicates that the Dictionary entry contains information on toxic or hazardous properties.

Type of Compound Index

This index lists virtually all drugs contained in the Dictionary under one or more headings based principally on pharmacological activity but also including some headings related to compound types (e.g. peptides, enzymes, tetracycline antibiotics). Sections appear in the following order:

Abortifacients	*page* 531
Acaricides	531
Adrenergic neurone blocking agents	531
α-Adrenoceptor blocking agents	531
β-Adrenoceptor blocking agents	531

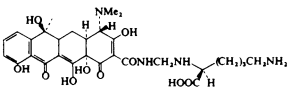
L-00116



L-00117

A glycoprotein consisting of two subunits designated α and β. It contains about 20% carbohydrate residues. Ovine LH-α is a polypeptide chain of 96 amino-acid residues having two carbohydrate moeities attached to asparagine residues at positions 56 and 82. There are spp. variations in the chain-length and sequencing of the α-chain but the points of attachment of the carbohydrate moeities appear to be species-invariant. Thus human LH-α has 7 residues less at the *N*-terminal end and approx. 70% structural correspondence with ovine LH-β in the rest of the chain. Ovine LH-β contains 119 amino-acid residues with a single carbohydrate moeity attached at asparagine residue 13. Human LH-β has 115 residues, 77 of which are identical with those of Ovine LH-β
