Short-lived multi-functional mammalian hormone found in the hypothalamus, the CNS, pancreas, stomach and intestine. It inhibits the release of growth hormone, thyrotropin, insulin, glucagon, gastrin, pepsin, secretin and vasoactive intestinal peptide (VIP). Of little therapeutic value at present because of its lability and multivariate action. Growth hormone-release inhibiting factor. Intensive research continues to find analogues of prolonged and/or selective activity.

Starch is composed of Amylose and Amylopectin. Amylose is preponderantly a linear polymer of several thousand D-glucose units mainly α-(1→4) linked. Amylopectin is a branched polymer composed largely of α-D-(1→4)-linked glucose units. The branch is α-(1→6) and occurs at the 6 position every 20-25 glucose units. Pullulanase, *R*-enzyme and Isoamylase hydrol. the α-D-(1→6) linkages.

Unbranched-form [9005-82-7]

Amylose

Stored in all parts of plants as insol. granules. Coml. starches come mainly from corn (maize), sorghum grains, tapioca root and potato tuber. Most starch samples contain 20 ± 5% Amylose which can be pptd. from aq. starch soln. with, e.g., Thymol. Used in particulate form as a dusting powder, as a gelling agent in processed foods, as a flocculant and pigment retainer in paper manuf. and in dried film form for sizing paper and textiles. Pharmaceutical aid. $[\alpha]_D$ +200° (H_2O), $[\alpha]_D$ +162° (1*M* NaOH), $[\alpha]_D$ +175° (DMSO). Hydrol. by acid, α-Amylase and β-Amylase. Forms inclusion complexes, gives a deep-blue colour with I_2.

Per-Ac: $[\alpha]_D$ +175° ($CHCl_3$).
Percarbanilate: $[\alpha]_D$ −82.5° (Py).
Per-m-chlorocarbanilate: $[\alpha]_D$ −190° (Py).
