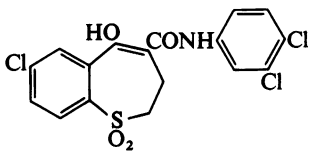
H-Tyr-Gly-Gly-Phe-X-OH
X = Met or Leu



Pentapeptides isol. from several CNS and peripheral tissues. [Met^5]-enkephalin is derived from β-lipotropin (residues 61-65). Many syntheses described. Both peptides have antinociceptive activity but this is v. transient due to the rapid inactivation by enkephalinases. Hundreds of analogues have been prepared and evaluated as analgesics in the hope of finding a long-acting non-addictive material.

Gentamicin *C* G-00018

Garamycin. Gentiomycin C

Aminoglycoside antibiotic complex. Consists of a mixt. of closely related and structurally similar components of which the most important are Gentamicins C_1 (R^1 = R^2 = CH_3), C_{1a} (R^1 = R^2 = H), C_2 (R^1 = CH_3, R^2 = H) and C_{2b} (R^1 = H, R^2 = CH_3). Isol. from *Micromonospora* spp. Broad-spectrum antibiotic. Most extensively clinically used aminoglycoside antibiotic.

[9002-61-3]

M 30,000-60,000

A glycoprotein hormone synthesized by chorionic tissue of the placenta, and found in urine during pregnancy. Found also in body fluids of persons having trophoblastic disease or embryonic testicular or ovarian tumours. Gonad stimulating principle. Long-thin rods or needles (EtOH aq.). Sol. H_2O, glycerol, glycols. Insol. most org. solvs. Stable in dry form. Isoelectric point pH 3.2-3.3. Dil. aq. solns. lose their activity rapidly on storage at 0°, or by heating, or by acid or base treatment.

A

B

A polymer composed mainly of two disaccharide repeating units A and B. A is L-Iduronic acid 2-sulphate linked α-(1→4) to 2-Deoxy-2-sulphamido-D-glucose 6-sulphate while B is D-Glucuronic acid β-(1→4) linked to 2-Deoxy-2-sulphamido-D-glucose 6-sulphate. MW 5000-15000. Occurs in the blood, skin, aorta, umbilical cord and in most tissues and is supposedly manuf. by the mast cells. Has anticoagulant, thrombolytic and antilipaemic action. $[\alpha]_D$ +44° to +70° (H_2O). Mainly used as Na salt. A variable fraction of the heparin chains are linked to serine or small peptides and contain the specific carbohydrate-protein linkage region (→ GlcUA → Gal → Gal → Xyl → Ser) identical with that found in several other connective tissue polysaccharides. The presence of this linkage region suggests that Heparin is synthesised *in vivo* as a proteoglycan.

Interferon, BAN I-00079

IF

[9008-11-1]

Human interferon has been classified into three groups; leucocyte, fibroblast and immune interferons. Human leucocyte interferon consists of a family of proteins with similar primary structures. As far as is known, every species is a polypeptide chain of 165 or 166 amino-acid residues. Each interferon group has a different capacity as antiviral, antiproliferative or immunoregulatory agent.

Interferon-α

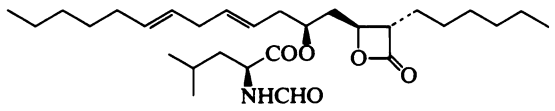
Lipotropin L-00054

β-Lipotropic hormone, *9CI. LPH*

[37377-93-8]

Linear peptide with 90 aminoacid residues. For full struct. see Chrétien, M. *et al*, *Nature* (*London*), 1965, **208**, 1093

M ~10,000



Endocrine hormone of the anterior pituitary derived from pro-piomelanocortin. β-Lipotropin itself contains the sequences of γ-lipotropin, a less potent lipotropic hormone, β-melanotropin (β-MSH), [Met^5]-enkephalin and β-endorphin. β-Lipotropin stimulates the release of fatty acids from adipose tissue. The high degree of sequence homology in the C-terminal 56 residues of the lipotropin hormones of several spp. (bovine, ovine, porcine and human) correlates with the presence of the biologically active peptides (*vide supra*). Marked sequence differences exist in the N-terminal portions and even polymorphism within a sp. (human) has been suggested.

Lutropin L-00118

Luteinising hormone. LH

[9002-67-9]

A glycoprotein consisting of two subunits designated α and β. It contains about 20% carbohydrate residues. Ovine LH-α is a polypeptide chain of 96 amino-acid residues having two carbohydrate moeities attached to asparagine residues at positions 56 and 82. There are spp. variations in the chain-length and sequencing of the α-chain but the points of attachment of the carbohydrate moeities appear to be species-invariant. Thus human LH-α has 7 residues less at the *N*-terminal end and approx. 70% structural correspondence with ovine LH-β in the rest of the chain. Ovine LH-β contains 119 amino-acid residues with a single carbohydrate moiety attached at asparagine residue 13. Human LH-β has 115 residues, 77 of which are identical with those of Ovine LH-β

M ca. 30,000

Lutropin is secreted by the anterior pituitary gland. The effect in the male is stimulation of testicular Leydig cells to secrete androgen. In the female it stimulates ovulation of the ovarian follicle and formation of the corpus luteum, which secretes progesterone.
